I believe I am justly summarizing all we at present know on the subject in the rough general statement, that, in giving increased velocity to a ship, we must, under the most favorable circumstances, expect to find the resistance increased *at least* in the ratio of the square of the velocity. That implies that a steamer consumes at least four times the quantity of coal per *knot*, and at least eight times the quantity of coal per hour, that she would do if driven at half speed, supposing her performance to be equally good in each case. But it is well known that a short ship cannot be driven at high speed without a higher expenditure than this. Professor Rankine adds terms depending on the theory of waves, and of stream lines. M. Dupuy de Lome uses a formula involving the square of the velocity, associated with other terms, one involving the cube, with a somewhat lower coefficient, and another involving a fractional power of the velocity. M. Dupuy de Lome's formula is avowedly tentative—empirical in its form. Professor Rankine's are, in his opinion, subject to great and imperfectly known limitations."

Mr. Merrifield goes on to say that the only way to arrive at some definite knowledge upon the subject, will be to make extended experiments, not with small models, but upon a large scale. He proposes to ask for a committee of the Association to advise upon the best means of bringing about that end; and in case that committee should agree with him, to memorialize the government upon the subject.

Economical Manufacture of Iron.—This subject has for some time past especially engaged the attention of English ironmasters. The immense waste of fuel has begun to alarm those who look to the future exhaustion of the coal mines; and the necessity of greater economy is earnestly urged. Various plans for furnaces constructed with this view have been described and are in use; but the "Radcliffe" process was spoken of by Mr. J. Jones, F. G. S., in a recent paper, as especially efficient. It has been in operation at the Consett Iron Works, Newcastle, for some time past. The puddled iron, which is usually rolled into rough bars, straightened and weighed, allowed to get cool, then cut up, piled, heated, rolled into bloom, reheated, and rolled into finished iron, after a complicated series of operations—is by the new method finished off by a continuous and simple process. Five or more puddled balls are put together into a large bloom, under a very heavy steam hammer, shingled down into a bloom, passed for a short time into a heating furnace, and rolled off into finished iron not more than half an hour after leaving the puddling furnace. It is estimated that a million and a half of tons of coal would be annually saved by the general adoption of this method.

Tungsten Steel.—Everyone knows that puddled steel, as generally manufactured, is not equal in quality to cast steel; nevertheless it is extensively used, in consequence of its comparative cheapness—for instance, in the manufacture of locomotive and wagon tires—it is said, however, to be four or five times less durable than cast steel. Ordinary puddled steel is also less adapted to the manufacture of files, saws, swords, edge tools, etc., since it does not possess the homogeneous texture, the tenacity, nor the hardness of cast steel. Now it is asserted that, by the use of wolfram, these superior properties can be imparted to puddled steel, so that its grain becomes as clear and fine as that of cast steel; and this by the mere addition of one to seven per cent., according to circumstances, of an alloy of iron manganese and tungsten, directly smelted from the wolfram ore for this purpose, or even by adding the crude ore in certain proportions to the iron in the puddling furnace. For wheel tires, two to three per cent. of tungsten alloy has been found to answer best in France; for files, saws, etc., two and a half to four per cent. is used, and for dies, punches, boxes, etc., four to seven and a half per cent. The theory of the action of tungsten upon steel is, of course, much more obscure than that of the action of manganese, which can scarcely yet be said to be entirely explained. If used for iron instead of steel, the proportion of tungsten alloy must never exceed two and a half per cent. of the entire metal, otherwise its hardness will be increased to a prejudicial extent; for cast iron rollers, however, it is recommended to use at least five per cent.—*Colliery Guardian.*

English Standard Weights and Measures.—The new microscopical apparatus constructed for the British Government, is said to be so exact that differences in length amounting only to the one-hundred-thousandth of an inch can be ascertained by a single direct measurement,—and much less differences than that by a computation of the mean of several measurements. *Engineering* says that, according to the recent report of the Warden of the Standards, the official standard yard was found to be about fifteen ten-thousandths of an inch less than the standard length. The same report has the following:

"The verification of the units of bullion weight has been based on the primary platinum standards, and it has involved the scientific comparison of standard weights differing in their densities. When weighed in air the apparent weight of a platinum standard pound is about .645 grains heavier than a brass or bronze standard pound; the true weight, their weight in a vacuum, being exactly equal; and no just comparison of such standard pounds can be made by weighing them in air without deducting the weight of air displaced by each. The result of these weighings and reductions of the primary platinum standards is that the relative weight of the imperial standard pound, which is an avoirdupois pound, and of the primary troy pound from which, with the aid of auxiliary platinum weights, the imperial standard was constructed, has been conclusively shown to be unaltered since 1845. It follows that the absolute weight of each of these platinum standards is also unchanged. The imperial standards of length and weight, the primary yard and pound, are deposited in the strong room of the basement in the building in the Tower, in an iron chest made by Messrs. Chubb."

Steel—the Siemens-Martin Process. Frederick Kohn, C. E., read a paper in reference to this process at the recent annual meeting of the British Association. Our readers will recollect the "Martin" process of which we have more than once spoken in the columns of the Press. The name at the head of this item is one which this process has received since it has come into use in England. By it, steel is made of a mixture of pig and wrought iron. The latter is added to the liquid pig iron at regular intervals, so that each following charge in melting increases the quantity of liquid mass, and adds to the dissolving power of the bath, until complete decarburization is arrived at. The charge is then completed by adding to the decarburized mass a certain percentage of pig iron, or of the well-known alloys of iron and manganese, and the degree of hardness or temper of the steel produced depends upon the proportion of this final addition. Referring to the question of how this new process is likely to affect the progress of the Bessemer system, of which it seemed to be a rival, Mr. Kohn said that in his opinion the only influence which it could have upon the Bessemer steel was to assist it, and widen the sphere of its application. The two processes, working with different classes of raw material, could never come into direct rivalry. When grey pig-iron of sufficient purity for direct conversion is used, the Bessemer process will of course be employed; but when the material is wrought iron, or pig iron which must be purified by puddling, this process will take its place. Old iron rails, etc., may in this way be worked up into steel. By utilizing the waste and offal of the Bessemer steel-works, the crop ends of steel rails and similar material, the new process will assist in cheapening the prime cost of Bessemer steel, in which the waste plays an important part.

Scientific Miscellany.

Fossil Plants—Darwinism.

At the annual meeting of the British Association for the Advancement of Science, held in August last, Dr. Hooker, the president of the year, in the course of his inaugural address referred to the difficulties under which the paleontologist labors in his floral researches. Most of the tertiary plants furnish no other material for their determination than their leaves,—and these in an imperfect condition. The leaves of plants are, at best, so variable as to be most unreliable guides towards establishing their structural character; and of their seeds and flowers, few traces are found in a fossil state. Boues and shells, on the other hand, afford more definite data for the determination of individuals belonging to the fossil fauna.

Dr. Hooker alluded to the twenty years' labor devoted by Mr. Darwin to careful and ingenious experimentation, before giving to the world his work on the origin of species; and in reference to his papers on the fertilization of plants, made use of the following language:

"It is impossible ever to enumerate the many important generalizations that have flowed from these and other papers of Mr. Darwin's; some that appear to be commonplace at first sight are really the most subtle, and, like many other apparent commonplaces, are what, somehow, never occur to commonplace minds; as, for instance, that plants with conspicuously colored flowers, or powerful odors, or honeyed secretions, are fertilized by insects;—all with inconspicuous flowers, and especially such as have pendulous anthers, or incoherent pollen, are fertilized by the wind; whence he infers that, before honey-feeding insects existed, the vegetation of our globe could not have been ornamented with bright-colored flowers, but consisted of such plants as pines, oaks, grapes, nettles, etc. * * * The result of his investigations places the whole subject in a totally new light before us. The guesses, crude observations, and abortive experiments that had disfigured the writings of previous observers are swept away; organs, structures, and functions, of which botanists had no previous knowledge, are revealed to them, and the whole is made clear. The value of these discoveries, which add whole chapters to the principles of botany, is not theoretical only; already the horticulturist and agriculturist have begun to ponder over them, and to recognize in the failure of certain crops the operation of laws that Mr. Darwin first laid down. What Faraday's discoveries are to telegraphy, Mr. Darwin's will assuredly prove to rural economy in its widest sense and most extended application."

In regard to the recent assertion made by the *Athenæum*, that Mr. Darwin's theory is rapidly declining in scientific favor, Dr. Hooker says: "So far from natural selection being a thing of the past, it is an accepted doctrine with every philosophical naturalist, including, it will always be understood, a considerable proportion not prepared to admit that it accounts for all Mr. Darwin assigns to it."

Ancient Traces of Man in the United States.—In our last issue, we noticed Mr. Foster's paper upon the antiquity of man in North America, read at the late meeting of the American Association for the Advancement of Science. We now copy from the *American Naturalist* the following data upon the subject, furnished by Col. Charles Whittlesey, who gave, at the meeting, an abstract of the evidences of such antiquity so far as collected:

1. Refuse shell-heaps of the Atlantic Coast, from Nova Scotia to Florida. Age not determined, but not very great. 2. Flint arrow-heads beneath Mr. Koch's skeleton of the mastodon in a peat layer, covered by alluvium fifteen feet deep, at Pomme de Terre river, Missouri. 3. A flint knife at Grinnel Leads, Kansas, found by P. A. Scott, at a depth of fourteen feet, in gravel and clay. 4. Three human skeletons of Indians, in a shelter cave at Elgin, Ohio; estimated age 2,000 years. 5. A log worn by the feet of man, probably Indians, in the muck bed at High Rock Spring, Saratoga Springs, N. Y., at a depth of nine feet beneath the cone, estimated by Dr. Grier to be 4,840 years old. 6. Copper spear-heads and other implements with human skeletons, apparently of the mound builders, at a depth of fourteen feet, at Brockville, Canada; found by Dr. J. Reynolds. 7. Several human skeletons in a cave near Louisville, Ky., with stone and flint implements; by J. N. Snowdon. 8. Pottery found by Dr. Holmes, associated with remains of the mastodon and megatherium, at Charleston, S. C. 9. A human jaw, teeth, and other bones, in quarternary conglomerate at Florida, estimated by Agassiz at 10,000 years. 10. Fire-hearths, found by C. Whittlesey, in the ancient alluvium of the Ohio, at Portsmouth, Ohio, at a depth of twenty feet, and beneath the works of the mound-builders. 11. Skeletons of Indians, reported by Dr. Dowler, of New Orleans, at a depth of sixteen feet in the alluvium, estimated by him at 50,000 years; by others as low as 15,000. 12. Portion of a pelvic bone of man, at Natchez, Miss., associated with the mastodon, megalonyx, and horse, supposed to be in the loess, but of doubtful authority. 13. Human skull and other relics, Calaveras County, Cal., at a depth of 150 feet in superficial materials, containing gold; reported by Prof. J. D. Whitney.

Combustion under Pressure.—At a recent meeting of the British Association for the Advancement of Science, Prof. Frankland read a paper upon this subject, in which, with the aid of certain experiments, he showed that the greater the atomic weight of bodies, the more luminous their flames when they were submitted to combustion by the electric spark. His attention was first directed to the matter by the noticing of the diminished illuminating power of candles at the summit of Mont Blanc, where the atmospheric pressure is comparatively slight. For a similar reason, if oxygen and hydrogen are inclosed in a soap-bubble or other light envelope, there is very little light produced; but if inclosed in a strong vessel and exploded by means of the electric spark, the light is ten times greater. Ignited gas gives light in proportion to its density.

Atom-mechanics Again.—We attempted, some months since, to give our readers some idea of the new atomic system of Prof. Hiurichs, of Iowa, in which *pantogen* is the single fundamental element, and *pan-atoms*, variously grouped, make up all chemical compounds. The last number of *Silliman's Journal* translates from the German a notice of the system, from the pen of Prof. Fleck, of Dresden. After showing that Prof. Hinrichs arbitrarily alters the formulæ "fixed by the most precise scientific labors" for the combining weights of the elements, in order to suit the figures which he has invented for the benefit of his hypothesis,—he concludes with the following remarks:

"While apparently based upon mathematical principles, Mr. Hiurichs' work dispenses with a mathematical basis; though furnished with an array of chemical atomic weights, these display no true scientific treatment; though adorned with physical phrases, correct ideas of the relations of space and force are entirely wanting. Science will consequently, have nothing to expect from Prof. Hinrichs' work in its present form, and like a still-born child it will be neither mourned nor missed. Every one who has seen from the above the weak foundation upon which the fantastic air-castle of this idea of pantogen is erected, will think it most advisable to be silent as to the further development of Prof. Hinrichs' monograph in the application and utilization of his ideas."

A Meteorite from Georgia.—Prof. C. U. Shepard notices, in *Silliman's Journal* for September, a meteorite in his possession which was plowed up in Cherokee County, Georgia, in April last. It is in the form of a human foot, is nearly black in color, and weighs six pounds and ten ounces. A thin slice weighing twenty-seven grammes was sawn from it and tested. The hardness was uniform; the specific gravity 7.52. It contained no sulphur, but abundance of nickel. The Professor says: "On being etched with dilute nitric acid, very beautiful Widmannstattian figures were presented, not quite identical with any with which I am acquainted, but most nearly resembling those of the Seneca Lake iron."

Work at the Foundries.

Great activity is observable at the Miners' Foundry. The machinery for a new poper mill in Santa Clara County, is in hand for King & Myers, who have selected as the locality, a place eight miles beyond the town of Santa Clara, near Saratoga. The mill is intended only for wrapping paper at present, but will be quite extensive. It will be run by two Hicks engines.

For two years past this foundry has been engaged in furnishing heavy iron castings for the State Capitol, and the work will continue for about two years longer. Every morning there are shipped to Sacramento, from four to ten tons of iron pillars, cappings, cornices, friezes, etc. Especially worthy of mention are the large capitals, which measure thirty-six feet in length, three feet in diameter at the top, and four feet at the bottom, being the largest castings os to dimensions that have ever been made in this State, so far as we are aware.

Five or six Hicks steam engines are also being built, for different parties; also one quartz mill for some point in the interior of Nevada; several very fine sugar mills have been sent within a short period to the Sandwich Islauds and Mexico; some heavy boilers have been made, etc.

Probably the most significant thing to be chronicled in this connection, is the fact that the Miners' Foundry people ore boldly competiog with the Eostern establishments in turning out such machinery as is required for wood manufacturing: small machines, frequently not costing more than $600 to $800, of every kind required in the country, such as planing and molding mochines, etc. These are sold at Easteru prices, or for whatever the Eastern mochines could be laid down for on San Fraucisco wharves. In heavy machinery, our works have long been successfully competing with Eastern manufacturers—for three or four years or more—but in regard to light machinery, the effort to rise has been experimental up to the present time. It is cloimed that we have now more average mechanical skill concentrated in our iron works than oan be usually shown in the East. There are many different nationalities represented in every San Francisco shop, and it is rather the rule than otherwise, that the individuals who find their way hither, are of the best capacity.

The ÆTNA WORKS have been engaged extensively on house work. Prominent amongst the orders now engaging attention, are the castings for the new theater on Bush street, and for Calvary Church on Geary street. Iron fronts for the extensiou of California Market, and for an engine house which is being built for the city on Folsom street, are also in hand. A sawmill engine of 20-inch bore and 24-inch stroke for Puget Sound, and another engiue of 12-inch bore and 24-inch stroke for a distillery at Antioch, are approaching completion. A lot of shafting and gearing is being mado for the Sen Marcial silver mine in Mexico, near Mazatlan. Quite a number of Carvalho's superheaters have been made lately, and are still continuing to be ordered, showiug that that invention is meeting the approvnl of engineers. Last week there were sent off eight of Varney's new improved amalgamating pans, and four settlers for the silver mine of Roberts, McNish & Co. in Lower Califoruia. On all kinds of general work, besides, tho foundry has for some time been kept very busy.

At the FULTON FOUNDRY they are making several steam engines for sawmills; the machinery for the manufacture of nsphaltum pipe, to be set up at Mr. Skinner's factory, at the Mission; an engine for a flour mill at Santa Clara; another for the new planing mill on Brannan street; and two more engines for Puget Sound. Lately there was sent off a 20-stamp quartz mill for the Casco mine, near Jackson, Amador County.

Mineral and Agricultural Land Titles.

RIGHTS OF MINERS AND FARMERS RESPECTIVELY DEFINED.

Like all the preceding documents from the Commissioner of the Laod Office touching miniog titles, the following will he found pertinent to the circumstances:

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE, Sept. 15, 1868.

George Stonehouse, Grass Valley, Nevada County, Cal.—SIR —Your letter to Senator Cole has been referred to this office, contoining your remarks about the effect of our "mineral instructioos" upon those connected with agricultural interests in California.

POLICY ADOPTED.

The miuers and farmers are so mutually dependent upon each other in California that considerations of interest alone should be sufficient to prevent any rivalry beyond that incident to the advancement of their respective interests. Without the miners the farmers of California would have but an indifferent market for their produce, and in the ohsence of the agricultural element, the necessaries of life could he ohtained only at exorbitant prices, impairing the welfare, not of the miners only, but of all classes. Hence, a community of interest should create a community of feeling, and all should alike strive to promote the lasting prosperity, the real glory of your truly wonderful State. The true policy of the United States, is as you remark, to sell all its public lands, farming ond mineral; and that is precisely what the Government is endeavoring to do through this office.

It has two classes of land, one *agricultural*, to be disposed of at the legal minimum per acre, under the preëmption, or for mainly a *labor* consideration under the Homestead Law; the others at $5 per ocre under the Miniug Statute; ond it is disposed of as rapidly as circumstances will allow.

FOR WHAT PURPOSE THE LAND IS MOST VALUABLE.

You speak of the hardships of permittiog miners to go upon land which agricultural settlers have bought, and dig up their orchards, gardens nud grass lands, nnd rob them of their titles. You do not state upon what class of lands such trespasses have been committed; whether upon mineral or farming lands; whether upon lands subject to settlement under the preëmption or homestead laws, or upon those subject to occupation only as mining lands.

If the land was bought from the United States, it is sufficient to say that no one, whether miner or another person, has a right to trespass upon it in that or any other way; nor can a settler be robbed of any title he has obtained from the United States. You probably have refereuce to the purchase of the *possessory* claim of a prior settler upon unsurveyed land; but, even then, the fact of having orchards on it as agricultural, would seem to imply that the settlement must have existed July 26, 1866, when the Mining Law was passed, and in that case, would be protected under the 10th section of that act, if the land is really agricultural and more valuable for farming than for mining purposes, no miner could legally disturb the settler in his possession.

The question to be determined is whether the land is more valuable for mining or for farming purposes. If the former, it helougs to the class called "Mineral Lauds," and is not subject to settlement as agricultural; and it would not be in the power of this office to protect snch a settler on it, for the reason that his settlement would not have the sanction of any statute. A settlement in California upon *surveyed* land, more valuable for farming than for miniug, is good under the 11th section of the Mining Act, and the settler may complete his title either under the preëmption or the homestead laws.

A settlement upon unsurveyed *agricultural* lands, made before July 26, 1866, is protected by the 10th section of the Mining Act, and the rights of the settler must he respected.

HOW TO SETTLE THE QUESTION.

When a questiou arises hetween a settler and a miner as to whether a particular tract of land is more valuable for farming or for mining, the farmer necessarily has the advantage of the miner in this, that before the latter can interfere with him, he must prove the laud to be more valuable for mining than for farming, a matter frequently impossible without expensive excavations, whilst, on the other hand, the farming qualities of the laud are found upon the *surface*, and are easily established.

The proof of mineral wealth can usually be furnished only at the expense of removing the surface, and if a miner does not wish to incur this expense, the agricultural settler cannot legally be disturhed, if he took the precaution not to make a settlement upon land palpably of mineral character even from surface indications.

The miuer's testimouy, also, must apply to every 40 acre tract; and if he fails as to any one of the four quarter quarter sections which a settler may take under the preëmption or homestead laws, the rights of the settler as to that remains untouched.

PROCEED PROPERLY.

It is believed, therefore, that if these settlers are careful, and select only such lands in the minerol regions as are by law subject to settlement for agricultural purposes, their rights cannot be seriously impaired. At all events, having the law on their side, they will be in a condition to enforce respect to them, and in all such cases may rely confidently upon whatever assistonce it is in the power of this office to render them.

Nearly or quite all the difficulties that occur in these respects come from a waut of compliance with the requirements of the law, through a want of attention, or a misconception as to the importance of looking well to these things before it is too late to correct the error without serious loss.

A settler may venture to make a settlement upon a tract of land, without any very definite intention of becoming permanently located; and hence may pay but little attention to the legal character of the laod settled upon, or whether it is by law subject to such settlement or not. Time passes on, and he may become pleased with the locality; property accumulates, and the evidences of thrift and industry multiply around him; but, sooner or later, some one finds out the original defect in his settlement. He now discovers that the tract of land was never open to settlement for the purposes of *agriculture*, and that there is no law upon the statute book to protect him. Here is undoubtedly a case of great hardship, but it is the direct result of not considering the subject properly at the right moment; of not reflecting whether the law was one way or the other; nnd of acting without any definite purpose in view as to whether his settlement would continue a month, a year or a lifetime.

IRREGULARITIES.

Where inattention and irregularities exist, difficulties and hardships must necessarily happen; and the wisest system of laws that the wit of mau ever framed could not prevent them.

I have thought best to answer your letter at length, with a view of convincing yourself and neighhors that it is the purpose of the law, as it certainly is of this office, to deal out eveu-handed justice to all classes of claimants, and in this way to further the important interests in issue whereby the immense resources of your great State may he developed, and individual and public prosperity advanced.

Very respectfully, your obedient servant,
JOS. S. WILSON, Commissioner.

HOW MUCH LAND MINERS CAN TAKE UP.

In view of the application of the terms of the Mineral Land Act to ancient river claims, the following, extracted from a Colorado paper, will be found treating of a question of importance:

DEPARTMENT OF THE INTERIOR, GENERAL LAND OFFICE, May 17, 1868.

B. M. Hughes, Esq., C. T.—SIR:—I have to acknowledge the receipt of your communication, dated April 27, 1867, desiring a construction of the act of Congress regulating claims to mines, etc., approved July 26, 1866. In regard to the number of persons required to constitute an "association" which, by the terms of the 4th section of the act of Congress as aforesaid, is authorized to take in any one claim *not more than* 3,000 feet. You further add that it is contended by some that to allow two or more persons forming an association to appropriate 3,000 feet while *one* individual can only take 200 feet, *two* persons 400 feet if singly, would violate the sense of the law, and in order to approximate the intention of the act of Congress it would seem that it would require say fourteen persons to form an associatiou mentioned in the law by implication.

In reply I have to say that the second proviso of the 4th section of the law is too positive and explicit, admitting, in the opiniou of this office, of no implication as to the number of persons required to constitute an association, for it directs that after the passage of the act of Congress, to wit: July 26, 1866, no person may make more than one location on the same lode, and not more than three thousand feet shall he taken in any one claim by *any* association of persons." Any association of persons comprehends two or more individuals, and although say two persons get 3,000 feet if located by them *since* the passage of the law of Congress, on one lode, they do not receive any benefit for the discovery of the lode, while a single locator is allowed by law 200 feet with an additional claim for discovery, together with a quantity of surface for the convenient working of the claim, as fixed by local rules, which latter benefit is not derived by the ossociation of persoos. Persons who think themselves aggrieved by the statutory discrimination iu favor of associations, are not precluded by the law of Congress from forming themselves into any associations and reaping the ndvantage conferred on the same over that bestowed on single locators.

I am very respectfully, your obedient servant,
JOS. S. WILSON, Com'r.

New Patents Issued to Pacific Coast Inventors.

pecially reported by the U. S. Patent Office, Washington, D. C., to NEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING SEPTEMBER 29th, 1868.

82,495.—IMPROVEMENT IN LAMP BURNERS. Wm. R. Cronna, San Francisco, Cal.:

1. I claim the combinotion with the vose of the burner and its shortened wick tube, and the elevated deflector, of a combioed air flue and wick holder, with openiogs I, as described, and the sleeve or cop J, supported upon the upper part of said flue and wick holder, substantially as and for the purposes specified.

2. The combination with the combined air flne and wick holder, and the sleeve or cap J, of the perforated casing or jacket, by which the same nre surrounded, os and for the purposes set forth.

3. The method of attachiog the deflector and of securing it in positioo, by means of arms *a*, fitted into sockets formed on the hurner for their reception in the manner described.

82,528.—IMPROVEMENT IN THE CONSTRUCTION OF HORSE SHOES.—P. C. Johnson and Edwin Froggott, Central City, Col.:

We claim the arms h, d, nttached to or formed with the calks, and hent down into holes in the bottom or under side of the shoe to form a locking device, in combination with the screws *a*, substantially as shown and described.

82,538.—IMPROVEMENT IN STEAM PROPELLER PLOW AND CULTIVATOR.—John Marquis, San Francisco, Cal., assignor to self and Ole Bergerson, of same place. (Antedated Sept. 16th, 1868.)

1. I claim the construction and applicotion of the cutters c, c, c, in form similar to that of a screw, and having bits b, b, b, at the ends of the blades substantially as described for the purpose set forth.

2. The attachment of the said cutters or screws in n diagonal manner, to the rear portion of the frame at such an angle as to overcome the side draught, and impart to the said cutters in their rotation, a progressive tendency, substantially as described.

3. The bars or levers I, I, for raising and lowering the frame and cutters, and employing the axle as a fulcrum for that purpose, substantially as described.

The chief feature in this invention is the apparatus for cutting and pulverizing the soil, which consists of a series of screws, which, as they are revolved, slice the earth in a direction opposite to the line of trovel of the machine. The mechanism to which the cutters are attached is so arranged that when they come in contact with any obstruction they will immediately free themselves. The inventor also claims that the power required to propel his plow will he less than for other devices for the same purpose, as the screws, turning as they do, will aid in the propulsion.

TOO MUCH GREASE.—Just grease enough should be applied to the spindle of a wagoo to give it a coating; this is better than more, for the surplus put on will work out at the ends, aud he forced by the shoulder-hands and nut-washers into the hub around the outside of the hoxes. To oil an iron axle-tree, first wipe the spindle clean with a wet cloth with spirits of turpentine, ond then apply a few drops of castor oil near the shoulder and end. One teaspoonful is sufficient for the whole. Lard should never be used on n wagon, for it will penetrate the hub and work its way out nround tenons of the spokes, and spoil the wheel. Tallow is the best lubricator for wood axle-trees and castor oil for iron.

Weekly Stock Circular.

By Associated Brokers of the S F. Stock and Exchange Board.

San Francisco, October 17, 1868.

Mining Share Market.

In reference to the mining share market we have to report a rather active market for some descriptions of stock, but as a general thing stocks have declined from prices ruling at the opening of the week. We do not look for a much better market until after the close of the present exciting Presidential campaign.

Imperial—declined from $112 to $102 50, then sold at $106, and closed at $105. The main drift from shaft on the 900 level has been steadily carried forward. They have commenced to drift west out of winze at 50 feet below the 700 level of the Alta mine. On the 600 level, east body, the ore does not look quite so well as heretofore, but the west body continues to produce well. They take about 20 tons of ore per day from the 400 level, and this deposit is reported never to have looked better than it does now. Hoist about 140 tons per day. The receipts for October to the 13th amounted to $12,278, and for the quarter just closed, $189,592, against $175,421 the previous quarter of the present year.

Kentuck—steadily advanced from $254 to $286, and closed at $275. The receipts of bullion for the quarter ending September 30th aggregated $136,282, against $338,253 previous quarter, and $330,982 same time last year. For October account to the 12th instaut, the returns foot up $19,928.

Crown Point—receded from $45 to $40, improved to $43, and closed at $41. Nothing of special importance from the mine. Some good pay ore is said to have been found in the north drift from the main northeast drift. The ground has been opened so that they can keep the mill running for a long time. On the 16th instant the connection between the north and south drifts on the 900 level was made. Shaft going down in hard rock. Receipts of bullion for the quarter just closed, $322,414; previous quarter, $453,751, and same time in 1867, $223,335.

Chollar Potosi—has been somewhat more active, declining from $155 to $140, and closing at $140. During the week ending October 9th, 959½ tons of ore were extracted from the new Blue Wing "country." The sinking of the incline has been temporarily stopped, for the purpose of adding more rope to the hoisting machinery. The north drift on the lower level is now 305 feet from the incline. During the quarter just closed the bullion receipts amounted to $262,035, against $188,078 previous quarter, and $913,681 same time 1867.

Confidence—shows a yield of $50,499 in bullion during the months of July, August and September, against $10,142 during the same quarter in 1867.....Empire produced $59,947 during the quarter ending September 30th, 1868; previous quarter, $55,260, and same time, 1867, $67,-235....Gould & Curry shows a bullion yield of $14,954 for the quarter just closed, against $105,886 same time in 1867, and $377,216 in 1866.

Hale & Norcross—declined from $49 50 to $13 50, and closed at $44. Nothing of importance from the mine. An assessment of $10 per share was levied on the 12th instant. Bullion receipts in July, August and September, $51,098, against $330,263 same months in 1867.....Gold Hill Quartz yielded bullion amounting to $28,-953 in July, August and September of the present year; same time in 1867 the product amounted to $23,281.....Overman yielded $66,415 in bullion during the quarter ending with September last.....Segregated Belcher exhibits a yield of $4,371 in July. So far in October $1,900 were received, and further shipments will soon be made....Sierra Nevada shows a bullion yield of $4,542 in September. On the 3d instant $2,183 were received, with further shipments soon to come forward.

Savage—sold to a very large extent during the week under review, nearly 10,000 shares having changed hands, declining from $110 50 to $83 50, rising to $93 60, and closing at $87. Bullion product in July, August and September, 1868, $606,929; same time 1867, $1,094,940.... Belcher levied as assessment of $25 per share on the 5th instant.

City Stocks.

The market for miscellaneous securities is quite inactive, Board transactions being confined to mining stocks. Spring Valley stock sold at $66, and San Francisco Gas at $77 25@77. The home insurance companies have very generally disbursed dividends for the quarter ending with September last, and to those already enumerated we add the following: San Francisco Insurance Co., which is now winding up its business, 2½ per cent. per month, or $7 50 per share, for the quarter just closed. The California Insurance Co. 2 per cent. per month, or $6 per share for the same period, carrying over a surplus of about $95,000 after paying the dividend; and the Fireman's Fund Insurance Co., 1 per cent. per month, or $3 per share. The Omnibus and North Beach and Mission Railroad Companies each disbursed their monthly dividend of ½ per cent. The Bank of California paid its usual monthly dividend of 1 per cent. on the 15th instant.

The Directors of the California Steam Navigation Co., says a local paper, "met on the morning of the 13th instant, and ordered the payment of the usual monthly dividend on the 15th. A resolution was adopted instructing the officers of the company to take immediate steps for the construction of two fast passenger boats for a day service between San Francisco and Sacramento. Also for the construction of a new boat, passenger and freight, for the Stockton route. It was also resolved that in view of this expenditure, it was the sense of the Directors to discontinue the payment of dividends for the future. This resolution does not affect the dividend announced above. The idea of the Directors appears to be to build two light draft boats, capable of making the trip in from five to six hours. These boats could be used for passengers and for day service only, and would not have the heavy decks and upper works necessary to accommodate freight and afford sleeping accommodations. They will therefore draw very little water, and will not be subject to detention. It is intended that one boat should leave San Francisco and the other Sacramento, early in the morning, and give travelers the same time in either city that the California and Pacific Railroad trains will. It is thought the saving of the transhipment at Vallejo will counterbalance the advantage of the railroad. A new boat has long been wanted on the Stockton route. The growing importance of the place imperatively demands better facilities than are now given by the Navigation Company."

We call the attention of the reader to the annexed table, the same being our usual quarterly statement relative to most of the stocks dealt in at the Board. With the exception of the Yellow Jacket Company, it is very complete. That company, during the fiscal year ending June 30th, produced $680,000 in bullion, of which no account is given in our table, for the reason that we have been unable to obtain the monthly yield from time to time. Taking the above amount as a basis, we find a bullion product for said company of about $60,000 per month.

The following mining companies, for want of space, have not been included in the statement published herewith: Dividends—North Star, (Cal.) in June $15,000, in July $15,000, in August $15,000; Bacon, in June $8,000; Golden Rule, (Cal.) in June $1,500, in July $1,500; Eureka, (Cal.) in August $30,000—total, $60,000. Assessments—Julia, in April $5,000, in August $3,000; United States, in April $12,000, in May $4,000, in June $4,000; Union, in June $6,000—total, $34,000.

San Francisco Prices of Copper Ores.

San Francisco, Oct. 16, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

		Per ton.			Per ton.
12	per cent. ore	$16 00	22	per cent. ore	$43 56
13	" "	18 62	23	" "	46 45
14	" "	21 20	24	" "	49 33
15	" "	23 85	25	" "	52 22
16	" "	26 25	26	" "	55 11
17	" "	29 12	27	" "	58 00
18	" "	29 91	28	" "	60 80
19	" "	34 90	29	" "	63 77
20	" "	37 78	30	" "	66 66
21	" "	40 67	31	" "	89 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

Electrotype Cuts, Engravings, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

MINING SHAREHOLDERS' DIRECTORY.

Trial of the Giant Powder.—Some experiments were made with the new Giant Powder on Tuesday last, at Messrs. Bandman & Neilson's works, about six miles south of this city, in the presence of a committee of the Mechanics' Institute, Capt. H. J. Pippy, J. J. Haley, D. R. Coleman, and other parties interested; A. K. Grim, D. Van Bokkelen, several mining specialists from the mountains, officers of the army, etc. 1. An 8-inch cartridge, weighing three-quarters of a pound, was placed one foot under water; it blew out a rock 2x2x8 inches in dimensions. 2. A hole was made into a bank one and a half inches in diameter and five feet deep, and loaded with ten ounces of powder; the result was an opening the size of a hogshead, eight feet deep. 3. A blast hole was drilled into a loose rock fourteen inches deep, and charged with two ounces of powder; the rock was 4x4x3 feet in dimensions, and was torn into small atoms. 4. Four ounces were placed under a ledge of rock; a hole was torn in the ground two feet deep. 5. Three-fourths of a pound was placed on the surface of a large boulder; the boulder was so cracked and shattered that with an axe it could be easily knocked to pieces. 6. A two and a half pound box of the powder was put into the fire, and burnt without explosion. 7. Two ounces were placed on the surface of a protruding flat shaly rock, which was blown to fragments, to a depth of two feet.

The committee expressed a desire to have witnessed the comparative effect with other powder, or at least a large blast in rock. It is hoped that before these experiments are done with there will be a fair test made of the different powders under identical circumstances and at the same time.

Continental Life Insurance Company, 302 Montgomery street, corner of Pine.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Chronicle, Oct. 3d: The time has come when the Rippon mine shows itself to be worthy of a more extended notice than we have heretofore given it. It is worked by a tunnel 502 feet in length. The indications or croppings are what mineralogists call felspathic quartz, and are of great extent, being 500 or 600 ft. in width; assays of which have been often made, and found to contain both gold and silver. At about 480 ft., quartz, having every appearance of containing silver, was struck. Several parcels of this were assayed in San Francisco and found to contain gold and silver from $16 to $40 per ton. As they progressed with the tunnel the quartz assumed a better character, with less interruption of country rock, and at a distance of about seven ft. the country rock entirely disappeared, appearing to be all silver bearing quartz with occasional clay seams. About 10 days since two shifts were put to work, and the Superintendent commenced saving ore; but suddenly a barren rock appeared, supposed, at the time, to be either the west wall or a horse. Drifting to the right it was found to be a horse, which being removed, better ore than ever was found. If the extent of the lode be judged by the width of the croppings, it will be from 500 to 600 feet wide; and if it is a fissure vein (there is now every appearance of it being such) it would not be strange if it even exceeds this, for there are many silver mines of greater width.

Amador County.

Jackson *Ledger*, Oct. 10th: The Summit mine at the south end of the famous Badger lode, is being worked by Tibbetts & McAllister. They have sunk a shaft to the depth of 200 ft., and for the last 30 ft. have been running down on the lode, with a vein of quartz 16 inches wide—the rock proving equal to any taken from the old Badger.

The Kennedy mill is kept running night and day.

The Casco mill is being pushed forward with great vigor.

The chlorination works at the Coney & Bigelow mill are now in full operation, and under the control of Mr. John Agrell, are producing astonishing results. Last Saturday they cleaned up after a run of four weeks, and a result of nearly $8,000 in gold was obtained. The gold produced by this process is of the finest quality, being .992.

The Butte Basin Co. have sold their steam engine, pumps and hoisting works to the owners of the Anaconda mine, at Pine Grove. They intend to work their claim in future by sluicing, having purchased the old tunnel that leads into the gulch, for the purpose of carrying off the tailings.

Dispatch, Oct. 10th: The new mine which is now being developed, on the south extension of the Badger mine, at Sutter Creek, is yielding a very encouraging prospect.

We were shown a beautiful gold brick, last Wednesday, at Reicbling's assay office in this place, which weighed 388¼ ozs. and valued at $7,961. The gold is .922 fine and is worth $20.50 per oz. This brick is the product of 60 tons of sulphurets from the Coney & Bigelow mine, near town, after being run through the chlorination works which they have erected at ther mill.

Calaveras County.

Mokelumne Hill *Chronicle*, Oct. 10th: There is a great demand for laborers in this vicinity at present. All of the principal claims are short of hands, and are offering the highest wages. Practical miners, carpenters and ordinary laborers, can get steady employment and a fair remuneration for services by visiting Mokelumne Hill. There is no excuse for idlers in these parts.

Nevada County.

Transcript, Oct. 8th: In the all-absorbing political contest, we seldom hear of other matters. But the number of locations made and the extensive preparations for work in the mines throughout the county indicate that the approaching mining season will be very lively. For two or three years past there has been a great revival in placer mining all over the county, and many of the new companies organized within that time will be able to take out money the coming winter, the prospecting having been finished. The quartz mines also have excellent prospects ahead in most localities, especially in the new districts, such as Graniteville, South Fork, Meadow Lake, etc., is there cause for encouragement. Nevada County has every indication for a prosperous winter in every department of mining.

J. J. Dorsey & Co. have located 200 feet on Mooney Flat Ravine, running back to the center of the hill, for mining purposes. The new location is bounded on the north by Jackson & Co's ground, and on the south by Hartley & Co's claim.

Gazette, Oct. 6th: The owners of the Willow Valley mine, the work on which was suspended a year or more ago, have made arrangements to resume operations. A considerable quantity of rock has been crushed from this mine, which has always yielded good returns, and the ledge is of good size; but the great cost of the hoisting works, and of sinking an incline through hard rock, was more than some of the owners could stand, hence the suspension.

We learn that the Chalk Mountain Co. have struck gravel in their tunnel, and are now taking out excellent pay. The company have been running this tunnel for over eight months past. The Nevada Co. have 37 men cutting a ditch from Burrington Ridge to a point between the main and north fork of Deer Creek. The ditch will be nearly completed by Thursday night, and will carry about 1,000 inches of water, which will be used for hydraulicing on the Nevada Co's ground. Several shafts have been sunk on Burrington Point, on ground belonging to the Nevada Co., and the main, or Relief Hill channel, has been found, and the gravel prospects splendidly.

Oct. 8th: About 375 tons of ore are crushed at the Eureka mine weekly, or 62 tons per day.

Grass Valley *Union*, Oct. 8th: Yesterday the personal property of the New York Hill Mining Co. was sold at Sheriff sale. This property consists of blacksmith tools, cars, drills, powder, candles, amalgam, sulphurets, quartz rock on the surface, and other things. The amount bid for the whole amounted to $1,170.75. The property sold for this sum could not be replaced for $3,000. The sale was on execution in favor of Geo. F. Sharp, of San Francisco.

Oct. 9th: The ledge in the bottom of the shaft in the Empire mine, on Ophir Hill, is from 2½ to three feet thick, and at this time looks well. We saw some splendid rock, all flecked with gold, which has lately been taken out. The 30-stamp mill is kept running day and night, and manages to keep pretty well up with the rock which is taken out.

Oct. 13th: The Coe mine is now looking better than at any previous time. At the depth of 365 ft., rock is looking splendidly and is certain to result in a fine yield when crushed. The 10-stamp mill is rapidly approaching completion, and within two weeks they expect to have the batteries at work.

Grass Valley *National*, Oct. 10th: Bradley, Hand & Co., working in the bed of Wolf Creek on a back ledge of the Dromedary Co. have had a crushing of 13 loads at the Gold Hill mill, which paid on an average $40 per load. They are down on the ledge about 50 ft.

EXCELSIOR.—*Transcript*, Oct. 11th: The Mohawk and Montreal Mining Co. is getting on first rate. The last assessment was paid promptly, and the Trustees are confident that the result from the ore will pay current expenses and extinguish the debt. The mill is now running steadily and the mine yielding excellent ore.

Placer County.

Auburn *Herald*, Oct. 10th: The Golden Rule 20-stamp quartz mill has been passing through Auburn, on wagons, this week, to its new location, on the Green Emigrant mine, where it will be up and ready for business in about 30 days.

John M. Gillard is erecting a new 6-stamp quartz mill on the Mammoth ledge, near Page & Bros' ranch, on Dry Creek, about four miles west and north of Bald Hill, which will be completed, and at work, in about 15 days. The mill will be run by water from the Bear River ditch. We learn that the ledge is a large one, and prospects well. It is not a specimen ledge, but one that from every indication, will pay regular.

Auburn *Stars and Stripes*, Oct. 8th: Fitch, Christman & Boggs have about 30 tons of quartz taken from the Grant & Colfax ledge, now at the Ophir steam mill, awaiting to be crushed. The rock indicates great richness. Thirty tons of rock from the Wahlgreen claim, near Ophir, crushed a few days since, yielded over $80 per ton.

Sierra County.

Downieville *Messenger*, Oct. 10th: On Wednesday last nearly $8,000 in solid chunks of gold was brought down from this mill to Scamman's Bank in this place. This is the result of only two months work. The arastra below cleaned up some $600. The prospect is that better returns than the above may reasonably be expected in the future from this direction of our mines.

Mr. Knowles, of Howland Flat, wishes to dispose of a one undivided third interest in the Tailing claims, formerly known as the Knowles & Fant claims; also, one undivided third interest in a hydraulic claim on Grant Hill, joining the Tailing claims.

Tuolumne County.

Sonora *Democrat*, Oct. 10th: During a recent visit to Big Oak Flat we were grieved to see the sad effects of the fall of the Big Flume. A great many people have already left that section and others are going. If the flume had not fallen and the supply of water had continued as usual there would have been livelier times on the Oak Flat Hill this summer than for several years past.

Yuba County.

Marysville *Appeal*, Oct. 11th: Thomas Cook has been appointed Superintendent of the Pennsylvania mine at Brown's Valley, vice E. Van Muller resigned. The Board of Trustees visited the mine a day or two ago, and decided to go on with the work for the present.

ARIZONA.

Prescott *Miner*, Sept. 17th: Jackson & Co. have recently purchased the mining claims and ditch below their hydraulic claims, on Lynx Creek, from S. Z. Pierce. The company now have undisputed sway over all these rich and extensive diggings, and as soon as the water dries up, they will go to cutting a larger ditch than the one now in use, building flumes, and preparing generally, for a vigorous winter's piping.

Placer mining has almost ceased on Big Bug—cause, not sufficient water.

As yet we have no news from Black Cañon diggings, Bradshaw district.

In Hassayampa district, they are taking some very rich ore out of the Chase lode. ....At the Sterling all is life and animation. Work has fairly commenced on furnaces and ledge.

In Walker's district, McWilliams and Winning have just worked and cleaned up 17 tons of ore from the Deposit lode, which yielded the sum of $1,054, or $62 to the ton. We saw them weigh the gold and sell it at $17 an oz....The other arastra men were cleaning up when McWilliams and Winning left the creek. The water was drying up fast.

At Wickenburg, on the 14th, both mills were running, but it was feared that a suspension was inevitable, for the reason that sufficient teams could not be had to haul rock, the Indians having taken nearly all the animals about the place.

Henkel & Baker, who have recently been employed by Noyes & Curtis at the Chase lode, showed us, the other day, a specimen of ore from a lode recently discovered by them, about one mile south of the Chase lode, and which they have named the Bunker Hill. The specimen left with us contains a great deal of gold, and they assured us that one pound of such rock, treated by them, yielded $1.

COLORADO.

Central City *Register*, Sept. 24th: There are three men at work on a slide from the Kansas lode, on Quartz Hill. They take about a cord and a half of dirt per day, which pays about $60 per cord in gold. It is crushed in the Beverly mill, which is running eight stamps.

A fine nugget of gold weighing 111½ pennyweights, was taken from Clear Creek a few days since. It weighs several pennyweights more than the one taken from Russell Gulch by Richard White, in the latter part of July.

Hurd's mill at Black Hawk, is now in complete running order. It has 20 stamps, six of which are put up by themselves to be used in reducing small lots of ore, prospecting, etc.

Col. Randolph, of the Ophir mine, on Quartz Hill, is working about 40 men in the mine and at the mill. They take out about three cords per day, the best of which runs 24 stamps, and yields about six ozs. per cord.

Georgetown *Miner*, Sept. 24th: The owners of the Equator have commenced sinking a shaft for ventilation between their two working shafts....Work on the Nuckolls lode has been resumed. In the bottom of the shaft they have about two feet of ore....The Marshall tunnel is progressing finely. The distance driven is about 45 feet....Work on the Elijah Hise lode has been resumed.. .Prof. Stewart started up his works on Monday night last. Next week we will have a report of his first runs, both by smelting and amalgamation....Byron E. Cox is developing a lode on Saxon Mountain, called the El Dorado, that has a four-inch vein of sulphurets that gives an average assay of over $300 in silver to the ton of ore....Last Friday we were in the Terrible shaft and drifts. In the west drift a shot was put in what was supposed to be the north wall, but which proved to be a fine mineral vein from 12 to 16 inches in thickness. This drift is now a little over 100 feet, and is yielding a large quantity of first class ore.

Central City *Herald*, Sept. 30th: The recent break in the Cullison water mill has been repaired, and commenced running last evening on ore from the Golden Eagle. Mr. Cameron showed us yesterday some very nice specimens of gold nuggets which were taken out of his claims on North Clear Creek, above the junction. His claims have been paying him very handsomely of late.

Mr. Hickcox is raising a very nice quality of argentiferous galena from the Franklin lode, at the head of Gilson Gulch. He is working two shafts, and is running both night and day hands.

We have been shown some very handsome specimens from the Rising Sun lode, just above Carson Gulch. From a cord which was run through Chency's mill, $118 in gold was obtained.

Messrs. Marsh & Terry, of Black Hawk, have purchased a water power on North Clear Creek, below the mouth of Missouri Gulch. They will erect a stamp mill on the same this fall.

The reduction works of J. O. Stewart, at Georgetown, are now running and will be successful. Their capacity is two tons per day, and any kind of ore found in Griffith district will be treated.

Cyrus Hurd started up his new 20-stamp mill this morning, on surface ore from a new lode recently discovered in Gregory district.

The Baker Co. have erected a large mill on Clear Creek. It is one of the finest in the Territory. When completed it will have three of the California cylinders for the treatment of sulphuret ores. The smelting and cupel furnace are now finished, and a test run has been made with satisfactory results. The mine does not yield sufficient galena ore to keep the smelting furnace constantly employed, but a considerable quantity has been obtained from the Hampton lode.

DACOTAH.

Frontier *Index*, Sept. 22d: We learn by a gentleman from Sweetwater that the camp at Rock Creek is coming out. It is paying $20 per day to the hand. Men are scarce in the California district, where wages are $5 per day in placer diggings.

IDAHO.

Owyhee *Avalanche*, Oct. 3d: We were this week shown an assay made by McDonald & Co., of ore from the Bedford, a ledge recently discovered by Noland, Larragay, Clark and others, in Flint district, about one and a half miles east of Owyhee City, which proves that all the rich quartz is not yet found in Owyhee County. The shaft is now down 12 ft., and shows a width of three feet, with even pay all through.

Rich gold ore has lately been struck in the Rapidan, which bids fair of becoming one of the best mines in camp.

Work is progressing on the first south extension of the Savage. The tunnel is now in over 30 feet, with good indications ahead.

A rich pocket has lately been struck in the Oro Fino.

The Lincoln mill has stopped for repairs.

Trask & Son's arastra is running on Rapidan ore.

Peck & Porter have a shaft down on the second extension of the Oro Fino, 90 feet from the bottom of which they are drifting north.

Winnemucca *Argent*, Oct. 8th: A private letter received from General Crook, says: I think that country will be pretty well prospected this summer and fall, as several parties were prospecting in different directions. They tell me that they found quite a quartz district on the Klamath road about the headwaters of Sprague River, but they had not prospected it. The Goose Lake country showed off to better advantage this year than it did last.

Lewiston *Journal*, Sept. 26th: A party of prospectors have left Elk in search of the much talked of Indian Diggings.

Rich and extensive mines have been discovered 20 miles from Pierce City, on Gold and Cow creeks—two large streams emptying into the north fork of Clearwater. We have known for sometime that gold had been found in paying quantities on Gold Creek—and that Messrs. Capps & Boyd were making $12 to the hand with rockers. The diggings on Cow Creek are not over eight feet deep; the prospects average from the surface to the bedrock eight cents to the pan. Ned Ryan took out of his claim as high as 75 cents to the pan. The gold is coarser than any ever before found in or near Oro Fino. The country around Gold and Cow creeks is said to be a better looking placer region than that of Oro Fino. Parties continue prospecting and are everywhere meeting with success. There are now from 40 to 50 men at work.

The Cœur d'Alene excitement has after all been very good—it having resulted in the discovery of this new and important mining camp.

MONTANA.

Helena *Post*, Oct. 2d: From Ingersoll, we learn that Henderson Gulch is still yielding good pay to all who are working in it.... He also informs us that Harvey Creek shows signs of better days. Two bedrock flumes are in course of construction ...Several fine silver ledges have been discovered on Boulder Creek, a tributary of Flint Creek. Cabins have been erected in the vicinity of these discoveries, and the parties named propose to work on the new mines during the winter....A shaft has been sunk to bedrock in Confederate Gulch, about 800 feet below the head of King & Gillette's flume, and prospects of 25 and 80 cents to the pan obtained. It is thought that the ground will pay $20 a day to the hand.

During the month of September F. Bohm & Co. have smelted $196,695.45 of gold dust, all of which has been transformed into gold bars, and sent East to be coined.

The crude bullion obtained from a very imperfect run in the Rutan furnace, near Jefferson, was brought to this city day before yesterday, and, under the manipulations of Molitor & Co., produced 263 ozs. of silver, with a fineness denoted by .872.

For the day and a half ending yesterday noon, Bohm & Co. smelted $21,640 worth of gold dust. This was run into three bars and shipped east on yesterday's coach.

Molitor & Co. yesterday received the first lot of Cœur d'Alene gold for smelting that has yet arrived in the city. It is found to be fully equal to Highland gold in fineness, being .975 fine. The dust is worth $19.45 per ounce in gold coin.

Alfred Metcalf, of Diamond, reports that the claim in which he is interested in Confederate Gulch, last week yielded the sum of $20,000 gold, $5,000 of which was obtained in one day.

From seven tons of ore the Rutan Mining Co. at Jefferson procured over two tons of bullion, which by cupelling, yielded 65 pounds of silver mixed with some gold.

Deer Lodge *Independent*, Sept. 30th: The Stuart mill is running on the Rumley & Bagher lode. This mine is 30 feet in width and well defined. Work is steadily progressing on the Hope, the ledge being eight feet wide, and the ore the richest ever found in Montana.

NEVADA.

Esmeralda.

Aurora *Union*, Oct. 3d: The publication of this paper has been discontinued, as the editor says, "for the present, and perhaps forever."

Virginia *Enterprise*, Oct. 10th: Wm. A. Bourne, Superintendent of the Midas mine, Pine Grove, arrived in this city last night with a gold brick worth $3,000, the result of a crushing of 100 tons of Midas ore. Mr. Bourne informs us that they have in sight some 600 tons of the same quality of ore. The Wilson Mining Co. are getting out and crushing some very fine ore—it averages $40 per ton. They have in sight a year's supply of the same kind of ore. The mine has never looked better than at present. The Wheeler Co. are taking out some very fine ore, the crushing of which has just been commenced at the Pioneer mill. Toombs & Abrams are working upon a contract from the Wilson Co. They have a 5-stamp mill of their own and doing well. Mr. Rice, of Carson City, is at work upon the Mountain View claim, which is an extension on the Midas lead, and has every prospect of doing well. Every mill in Pine Grove is at work.

Humboldt.

Unionville *Register*, Oct. 3d: Reports from the different mines in Gold Run district are of the most favorable character. The Golconda, Cumberland and Register claims are improving daily in richness of ore and extent of veins. The new mill is being built in the most improved style by men thoroughly competent to guarantee success.

Work will be resumed on both the Sheba and De Soto companies.

Fall & Co. shipped this week, per Wells, Fargo & Co's Express, 2,700 ounces of fine bullion.

The Golden Dart ledge, in Santa Clara district, bids fair to eclipse in richness anything ever discovered in the gold line in the State. The vein is small, but the quartz fairly glisteus with free metal. It is within about eight miles of the railroad, and its owners propose to ship the ore until they can arrange for the erection of a mill.

Winnemucca *Argent*, Oct. 8th: J. M. White brought down 103 pounds of Golconda bullion this week. The water is rising in the ditch. The mine is yielding an improved quality of ore.

Holt's mill, in Gold Run, will soon be ready to crush ore. Mr. Holt has recently been to San Francisco for machinery.

Reese River.

Austin *Reveille*, Oct. 3d: The district of White Pine still continues to be the chief attractive point of the "Great East," to which the attention of all is directed, and from which glowing accounts of marvelous discoveries of silver ore constantly emanate. From those who have recently visited this most wonderful region, and whose observance of the condition of affairs there enable them to speak understandingly, we are led into a belief that another year will witness upon that spot a city second to none in the State. It is scarcely possible to do justice to the mines of Treasure Hill, and at this time we will not attempt their description. One alone—the Eberhardt—is producing immense quantities of ore, the second class of which by mill process, and which class is at present alone worked, yields a sum exceeding $1,000 per ton! Considerable quantities of this has already been reduced, and none as yet has been worked which has not greatly exceeded that sum. The first class, of which there is an amount in sight at the mine beyond calculation, will produce from $10,000 to $12,000 per ton! One small pile of dirty looking matter is shown to the visitor. It could easily be piled upon an ordinary sized wagon, and yet one is told that its value in gold coin is near $100,000. A close observation shows it to be horn silver, mixed with a little silica, and were one not inclined to believe before that it was of such extreme richness, the observation removes skepticism. And such ore as this comes from the body of a vein thoroughly explored to a depth of about 70 feet, more than 100 feet in width, and with smooth and solid walls encasing it upon either side! Such, in brief, are the Keyestone and Eberhardt—both upon one vein—showing without doubt the most remarkable and by far the greatest body of chloride ore ever yet discovered in this or any other country upon the globe. More than 100 miners are constantly at work upon the Eberhardt, while all around in close proximity are numerous parties of miners delving for treasures which they seem to find a few feet below the surface in veins of lesser magnitude, and whose constantly exploding blasts make it exceedingly lively as well as dangerous for those visiting and working in the locality. At Hamilton there is a plentiful supply of water, and there is a magnificent 10-stamp quartz mill now in course of erection by Jeremiah Miller.

Pack trains are now delivering ore at Page's mill from the Eberhardt and other mines, and soon the stranger, as he approaches Shermantown, will be greeted by the clattering stamps, and at Tom. Luther's assay office and melting works, now ready for business, can feast his eyes upon great piles of bright silver bars produced from the richer ore, with less labor, and more rapidly than at any other region in the world.

We learn that a very rich body of ore has been struck in the Timoke mine. We have not yet learned the particulars, but have seen some of the ore which looks very well.

Oct. 5th: For the week ending Saturday the 3d inst., the Manhattan mill produced 35,525 ounces of bullion.

Oct. 6th: Late yesterday afternoon a lot of bullion, comprising 35 bars, averaging .960 fine, and valued at $48,489.56, was brought into the city from the Centenary mill in the Newark district. The bullion is the product of ore obtained from the Eberhardt South and Keystone in the district of White Pine, and was reduced in one week at the Centenary mill.

Grass Valley *National*, Oct. 9th: The silver mines of the White Pine district, Nevada, are in two respects the most remarkable yet discovered in that State. The ore is the richest, and it is thus far mostly found in a deposit on the surface, as if from the decomposition in place of the outcropping rock. The Comstock lode was first traced from a similar surface deposit, but not of equal extent or richness. If we are to believe the reports from the White Pine, the masses of horn silver found on the surface are many feet in depth, and cover a considerable area. Some of it is said to yield, not to assay merely, $5,000 to $10,000 per ton; and in several claims large quantities are reported which yield hundreds of dollars per ton without selection. The rock is mostly parted from the ore, leaving the latter in rich masses, concentrated, as it were, by the action of the elements.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district

Virginia *Enterprise*, Oct. 7th: The machinery is being removed from the old, dilapidated Comet mill, at Gold Hill, and the building—what is left of it—will shortly be torn down.

During the month of September, Wells, Fargo & Co. shipped from their office in this city, bullion to the value of $523,999.35, and for the same month the shipment of the Pacific Union Express Co. was $41,898.89; making the total shipment from this city during the month, $565,898.24.

Oct. 8th: The Mexican mine in this city has been leased for nine months by Sweetapple & Hirschman, the well known millmen. They have furnished the works with a new boiler, engine and hoisting works, and to-day the whole will be in operation. We saw yesterday many specimens of ore which they have taken from the mine that reminded us of early times in the history of the Comstock, so rich were they in the soft, black sulphurets, then so common and so much sought for and admired. Some of these show spangles of bright, native gold, and would make valuable cabinet specimens, as it is now a difficult matter to find that particular variety of ore.

Oct. 9th: The Alpha mine, Gold Hill, is producing a large amount of "red ore," a species found in the upper levels. Work below the 900-foot level has been discontinued for the present, owing to the large quantity of water encountered.

Oct. 10th: The Pacific Union Express Co. shipped last night eight bars of bullion worth $12,495.55.

The Bullion Mining Co. will shortly commence sinking their main shaft to a further depth of 200 feet. It is now the deepest shaft in the State, being 1,200 in depth. The Bullion folks are bound to strike silver, the infernal regions, or China.

During the past week there has been shipped by the Express Co's from this city and Gold Hill 8,312 pounds of assayed bullion, valued at $196,216.06.

NEW MEXICO.

The Colorado *Chieftain* says the news from the Moreno mines continues favorable. Every day brings reports of recent and valuable discoveries. In fact, intelligence from the mineral regions in every direction is very encouraging.

OREGON.

Dalles *Mountaineer*, Oct. 2d: By a party just returned from Willow Creek, we learn that there is no doubt of rich diggings existing in that region of country. They expect by another year to have plenty of water to work the mines, when they will be thoroughly prospected.

The Blue Mountain *Times* says that very good placer diggings have recently been discovered on a fork of Cañon Creek, 13 miles from Cañon City. Two new discoveries have also been made in Baker County, not far from Auburn, which will undoubtedly become good camps in the spring.

Mexican Silver in Philadelphia.—A recent purchase has been made, by a Philadelphia company, of certain mines in Chihuahua from Don Raphael Ortiz, who has for the past nine years successfully worked them in the old Mexican style. The mines are reported to pay largely. A correspondent says: "Having visited the celebrated Comstock lode, Virginia, Nevada, and several of the most prominent mines in that vicinity, I failed to see anything there that would compare in richness to the Mexican mines. I am satisfied that if the Mexican government was what it should be or was in the hands of Americans, so that capitalists would be justified in investing money in the development of mines, the result would astonish the world. The Manta Grauada, Santa Rosa and San Martin mines are owned by a Philadelphia company, of which Mr. J. S. Waterman is president and Mr. J. M. Crawford treasurer. The superintendent, Mr. Dickson Rany, left Mazatlan July 22d, on the steamer for Guaymas, en route for the mines, and has brought direct from the East improved water wheels and other machinery needed for the better working of the mines."

Inventor of the Melodeon—Its Principle.—Jeremiah Carhart, the inventor of the melodeon, has just died. In 1836, while studying the construction of the accordeon, he discovered that the tones were much better when the wind was drawn through the reeds than when it is expelled through. A series of experiments followed, which led to the discovery of the melodeon.

On or about the 21st of October the overland stage will connect with the cars at the mouth of Reese river.

Steam Traction on Common Roads.

The success of common road traction engines in England, Canada, and Brazil, is attracting attention, and the practicability of a new system of roads cheaper than the present iron railways and more efficacious than the common roads, is being discussed in many of the engineering and railroad journals. Adams, a London engineer, in a letter to the *Times*, says:

"The practical fact is, that properly constructed engines and carriages can run upon as sharp curves and up as steep gradients as horses can, and with a power of carrying loads that no horses could ever accomplish, and therefore every common road in England has the capacity for becoming a railway, with its inns, stations, towns, villages, farms, and water supply already provided. These common roads intersect the railways and form approaches in every direction with very little outlay. The rails (bands of iron) can be laid flat with the surface, and permit the traffic of ordinary horse vehicles so long as horse vehicles continue to be used. Steam trains can travel on such lines at any speed from five to thirty miles per hour, and although tram rails, as they are called, may be objectionable on crowded London streets and thoroughfares, and such neighborhoods as the parks, country roads present a very different set of circumstances. Railway directors complain that the landholders have doubled the value of their property by lines made by others which do not yield a dividend. There is no apparent reason why railway shareholders should not acquire land along their borders, and erect buildings on them, putting a profit into their own pockets by rents, to which transit fares would be subservient. There is no reason why steam traffic should not obtain the ten miles an hour of the old mails, the more especially as it is more under control than horses are, and the train can be brought to a standstill more effectually by steam than by whip and reins. Nor is there any reason why the keepers of horses should be allowed to use skittish animals upon public roads, for it is as easy to break a horse into a steam engine as to a cannon."

It is said that cheap wooden railways have proved successful at several places in the interior of New York, on one of which traction engines are used. The Boston *Railway Times* adds:

We have no doubt that the street railway system can be extended very largely in the suburbs of the larger cities with profit to all concerned. Mr. Adams states that when a traffic of $15 per mile per week can be calculated upon, it will justify the laying of the rails on common roads as a self-contained speculation, and no truth is more certain than that the means of transit creates and increases transit, and thickens population.

The Ediuburgh *Scotsman* has the following on the same general subject:

On Saturday afternoon a very remarkable sight was seen in this city. A train of heavily laden coal wagons, looking exactly like a luggage train, was observed coming steadily up the steep incline leading into Edinburgh from Dalkeith. It was one of Mr. R. W. Thompson's patent road steamers, with india rubber wheel tires, having four huge loaded wagons in tow. Each wagon weighed, when empty, two and three-quarter tons, and carried a load of five and one-quarter tons of coal, making the gross weight of the wagons thirty-three tons. The road steamer weighs eight tons. Thus a total of forty-one tons was in motion. The road steamer had drawn the train from Newbattle collieries, eight miles from Edinburgh, over a very hilly road, with rising gradients of one in sixteen.

The hill from Pow Burn up to Minto street is both long and steep, but the road steamer drew its train to the top with the most perfect ease. There can be no doubt this invention of the application of vulcanized india rubber to the tires of road steamers forms the greatest stop which has ever been made in the use of steam on common roads. It completely removes the two difficulties which have hitherto barred the way to the use of traction engines—viz.: the mutual destruction of the detraction engine and the roads.

Lamp for use under Water.—Mr. John Ward, of Port Glasgow, has invented an arrangement for supplying light under water; it is an ordinary lantern, with two tubes for the descent and ascent respectively of air. Mr. Ward thinks that the heat from the flame will cause the necessary current of air.—*London Mining Journal.*

Notices to Correspondents.

[We take this opportunity of explaining to intending eorrespondents, that it is always presumed that when seeking information through the medium of this eolumn, that while on our part preserving any requested or inferred ineognito by the adoption of initials or pseudonym by the former, we, as well as all editors expect sueh eommunication will be invariably accompanied by the real name and address of the writer. On the last named account, the eommunication which will presently be notieed, has been passed by for more than a week, on re-pernsing the same, when assorting matter for the waste basket, we deemed it probable that S. P. J. might possibly be unaware of the general rule with editors of periodicals.

S. P J. inquires if an engine of 25-horse power, having 60 pounds of steam, with a driving wheel 29½ inches in diameter, with a belt running on to another wheel, five feet ten inches in diameter, the engine making 100 revolntions, whether by lagging np the 29½ ineh wbeel to 35½ inches,—that is tbree inches on each side,—will it not take less steam, aud the engine make fewer revolntions, and the engine labor less to drive the same machinery or to get the same number of revolntions? If onr correspondent will only hear in view the well estahlished Newtonian axiom, that what is gained in motion is lost in power, and what is gained in power is lost in motion whenever the initial foree is the same in hoth cases, he would pereeive that tbe desideratum which he seoks to secure is unattainable, and in this case, but it must he apparent to our correspondent, that if the speed of the engine is redueed, thus redncing the quantity of steam required, that the power will be redueed aceordingly.

Cerealia.—If seeds are sown as soon as they are gathered, they generally vegetate, at the latest, during the ensuing spring; but if they are first dried, it often happens that they will be a whole year or more in the ground without altering. This property varies greatly in different speeies. The power of preserving their vitality is also variable; some will maintain their germinating powers many years, in any latitude, and under almost any cireumstanees. Melon seeds have been known to grow when forty-one years old, maize thirty years, the sensative plant sixty years, kidney beans 100 years. Clover will make its appearanee on recently dug or plowed land, on places where no clover had previonsly heen seen to grow within the memory of man. The black, or as it is in California commonly called wild mustard seed, possesses astonishing proporties in this respect. Dr. Lindley has stated that he possessed three raspberry plants whieh had been raised in tbe garden of the London Horticultural Society, from seeds obtained from the stomaeh of a man whose skeleton was found thirty feet below the surface of the earth, at the bottom of a barrow, which was opened near Dorchester, England. The body had been buried with some eoins of tbe Emperor Hadrian, and if no error has occurred, it would render it probable that the seeds were sixteen or seventeen hundred years old.

Age of the Ancient River Channels of California.

Do miners eare to know anything about the age and history of the ancient river ehannels in which they are tunneling, and delving, and slnieing like Titans, a thousand or two feet up in the mountain sides above the present river eourses? The question is superfluous, for the Californian miner is not a navvy. The engineer of the nozzle and hose-pipe earries his head and eyes with him, and if there is a petrified or a earhonized log in the ehannel, he will eertainly notice whieh way the butt lies.

Faets are not wanting, which, if eolleeted from the observers, and put properly together, wonld furnish ns with a eompletely satisfactory aceount of the wonderful transformation of the topography of our golden foot hills, and of the mystery of a system of antedilnvian rivers on the mountain tops. It is not theories on the subjeet, however, that we are in need of, for everyhody has his theory or theories, as to the eanses and eatastrophies, the turnings and eonrses, and the hights and depths of the anriferous ehannels, in whieh there is freqnently displayed an intimate knowledge of the operations of nature, sueh as would be aeknowledged to be deserving of the highest eredit if possessed by a scientifie man. Nor should we he hasty in eondemning the late State Geologieal Snrvey for having furnished ns with so little in regard to the aneient river ehannels, until we know at least what actually has been done. A eareful perusal of Prof. Whitney's first volume on Geology will diselose much valuable information on the subject, that general or superficial readers would not be aware of.

The geological age of the later deep placer deposits, dating snbsequent to the era of volcanic eruptions, when so many of the river heds were filled up by lavaflows, is put down as equivalent to the post-Plioeene or latest Tertiary of the East and of Enrope; the animals and plants of which are the same as those now liviug as to genera, but are not generally identical in speeies. Particular speeies of the mastodon, elephant, horse, tapir and buffalo (described by Leidy in the Proceedings of the Philadelphia Academy of Seiences for 1865), differing from those found in the river channels under the eement ridges or lava flows (see "Table Monntain" in State Geologieal Report), mark the age of the shallower and uneovered gravel deposits as distinet from, and of later date, than the aueient rivers proper, where tbere seem to be not only different species, hut different genera from thosc now living. Amongst the "medals" from underneath the lava or cement ridges as they are generally called, Newberry deserihes as plants peenliar to tho formation, the species *Acer* and *Carpinus*, which have never been fouud to date so far back as the Eocene, or earliest Tertiary; while Whitney mentions as also charaeteristie a kind of rhinoceros, an extinct horse, and a species of eamel ealled the Megalomeryx. None of these seem to have existed sinee the Pliocene age proper; and they correspond very nearly to the fossils of the prolifie Plioeene formation on the Niobrara and White rivers, east of the Rocky Mountains, explored and determined by Hayden.

According to the facts just given, the date of the lava flows, tben, appears to be pretty well marked, as the separatiug line in our horizon, between the Plioceno and the post-Pliocene, or Recent, or "Pleistocene" age.

It is in this latter age that man first reords his existenee amongst the durable materials of the rocks. By means of animals encased in formations overlapping each other, the post-Pliocene age has been snbdivided in Europe into the Cave Bear and the Reindeer epoehs, in both of whieh, accompanying extinct speeies of animals, stone arrowheads, and other human relies have been found, which have indneed geologists to designate it as the Stone Age. Much interesting information eoneerning the early history of man has heen dug from the bowels of the earth by Lartet, Vogt, Christy, and others. In the Swiss laeustrine or lake shore, and in the Ameriean mound relies, we have suggestions of what will soon be understood and separated as eras in the geologieal history of man; and geology is thus brought down to the verge where it passes over into a history of antiquities.

In California relies of the Stone Age have been repeatedly found in eonneetion with the bones of the mastodon, elephant, tapir, huffalo, and other post-Plioeene fossils, in the shallower gravel deposits; but the press, and scientifie people, have been very incredulous with regard to alleged evidenees of man's existenee prior to the era of the lava flows. It was in 1866 that Matteson, a miner near Angel's Camp, dug out a skull from an aneient river ehannel, in a shaft 130 feet down nnderneath a flow of lava. Prof. Whitney believed the diseovery to he the most aneient of all known reeords of the existenee of the human race. Representing the inerednlity of the quidnuncs, Frank Brett Harte availed himself of the privileges of poetry, and addressed the skull itself, in order to settle the vexed question:

Eo—Mio—Pio—whatsoe'er the "eene" was
That those vacant sockets filled with awe and wonder—
Whether shores Devonian or Silurian beaches—
Tell us thy strange story!

And, from that imperfect dental exhibition,
Stained with expressed juices of the weed Nicotian,
Came these hollow accents, blent with softer murmurs
Of expectoration:

"Which my name is Bowers, and my crust was busted
Falling down a shaft in Calaveras County;
But I'd take it kindly if you'd send the pieces
Home to old Missouri!"

So the question was settled; hut it was not destined to stay settled, because there are more skulls to he disposed of. Bowers was nndoubtedly a Plioeene fossil.

The additional evidence that now presents itself is in the shape of a eollection of spear heads, and other stone relies, which have been found in the gravel at the end of a tunnel underneath the Table Mountain lava flow, near Sonora, Tuolumne County. Dr. L. G. Yates, of that eounty, an industrious collector of fossils and minerals, and agent of the Mining and Scientific Press, has favored us with an opportunity to examine these relies, hy laying the originals on our table, together with some plaster casts of the same, which are to be forwarded to the Smithsonian Institute. Similar relies from an aneient river bed under lava, we notiee, were described hy Prof. W. P. Blake, before the American Assoeiation for the Advancement of Seience, which recently held its annual meeting at Chicago; belonging, like the following, to Dr. Snell's collection, Sonora.

The specimens eonsist of two spear heads, very long, round, and broken off where the holes were made to fasten them to the wood, heing made of silicious slate; two scoops or ladles with short handles, resembling the little horn seoops used by drnggists, worn off from uso on the left hand side, heing made of a psendomorphous micaeeous steatite; a little cylindrical piece flattened on one side, with notches for tying fast, which might have been used as a bow stiffener, or possibly as a shuttle, of laminated slate; a hodkin, with a notch for strings at one end, of silicious slate. These stone relies differ entirely from anything ever found in the possession of the present Indians of the Pacific Slope. From other localities, in gravel not covered hy volcanic lava, there was shown ns a ealc spar ornament, which might have been some savage giant's ear-ring, and a pipe bowl (prohahly), of steatite.

Four boxes of specimens of this kind have been sent by Dr. Yates to the Smithsonian Institute, where Professors Baird and Henry are now, and have been for some time, assidonsly engaged in gathering and preparing the material for an exhaustivo work on the Stone Age of tbe human race in North and South Ameriea.

As worthy of note, mineralogically, we may mention in this eonnection, that Dr. Yates has also brought with him to this city a large piece of vein rock, studded with quartz crystals having gold partially crystallized spangled thiekly over the surface of the quartz erystals, as well as distributed through them in laminæ, and very riehly through the body of the rock.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 271.—Siliea, eontaining mueh iron, prineipally jasper, with darker streaks richer in iron than the rest; from a large vein near Taylorville, Plumas County, which was supposed to eontain quicksilver. Charles Burr.

No. 272.—Pebble of titanie iron, from Gold Lake, Sierra County.

No. 273.—Gold ore, pyrites, from the Mohawk ledge, Exeelsior Distriet, Nevada County; heing the same that has heen under treatment in the Hagan furnaee roasting process.

No. 274.—Burnt pyrites, showing free gold, from the Wiseonsin mine, Meadow Lake, Nevada County. Presented by A. M. Burns, Superintendent.

No. 275.—Ore from the famous Poorman mine, Owyhee District, Idaho. Blaek sulphuret or vitreons silver, and free gold, distrihuted in quartz. Presented by the Superintendent, W. C. Lord.

No. 276.—Ida Elmore mine, Carson Distriet, Idaho (locality of the snbterranean war). Black sulphuret and free gold, in well defined parallel layers, interstratified with quartz. W. C. Lord.

No. 277.—Banner ledge, Yuha District, Idaho. Bright red or ruby silver, and vitreous silver, distributed in quartz. Wm. Purvine.

No. 278.—Graphite, locality unknown.

No. 279.—Petrified wood, Napa County. Ezra Carpenter.

Notice to Patentees.

We have on hand the following patents whieh we have reeeived from the Patent Offieo in Washington, for inventors on this coast. We hold them subjeet to the orders of the owners.

Gang Plow.—James T. Watkins, Santa Clara.

Manufacture of Brick.—Silas H. Bowman, Half Moon Bay.

Amalgamator.—Alfred Horn, Silver City, Nev.

Car Coupling.—Geo. H. Henfield, San Francisco.

Ball Alley.—James D. Patriek, San Franeisco.

Revolving Furnace for Roasting Ores. Frederiek Ernst, San Franeisco.

Gang Plow.—James H. Andrews, Benicia.

Car and Track for Elevating on Inclined Planes.—James W. Pearce, Suisun.

Motive Power.—Stockton & St. John, Folsom.

Carriage Spring.—Walter B. Higgins, San Francisco.

Chain Inclinometer.—Hermann Schussler, San Francisco.

Kiln for drying Malt.—Oefinger & Grupp, San Francisco.

Introduction of Gas into Railroad Cars.—The New York and New Haven Railroad are trying a new experiment in the use of gas in their cars. A former experiment was tried on the same road a few years ago; but the inventor in that case relied upon atmospheric pressnre to force the gas from the gasometer (under the cars) to the burners, and the plan proved a failure. In the present instanee the gas is forced out of the gasometer to the burner by means of strong springs, and the qnantity of light can be regulated as desired. The new apparatus has as yet only been applied to one ear of the 8 o'elock, P. M., Boston Express Line, with very satisfaetory results, and will, in all probability, be introduced in all the cars of the night-lines at an early day.—*Gas Light Journal, Sept. 2d.*

For Water Dye.—It is said that simple tar water may he employed for dyeing silk and wool what is called a *gris cendre*, or ash-gray color. The stuff is first mordanted with weak perehloride of iron, by soaking in the solution for some hours. It is then drained and passed through the bath of tar water. The oxyphenate of iron, which is thus preeipitated on the fabric, gives a very solid color.

Evans' Corrugated Riffle and Concentrator.

Mr. Geo. R. Evans, of Virginia City, has been exhibiting during the week, on Clay street below Battery, a modification of the ordinary amalgamated copper riffle plates, in use in the quartz mills, and sometimes in shallow placer claims, which possesses peculiar features worthy attention. Instead of being angular in profile, the unoven surface over which the pulp passes is corrugated, like the material forming the walls of the iron houses which every Californian has seen; or "hollow and round," as the inventor aptly designates it. The corrugation is exactly semi-circular, and therein lies the chief peculiarity; the effect of the same being that the particles of one are so tossed, rolled and ground against each other, as to be alternately under the sway of the current, and thrown off successively into a series of eddies. An idea of the manner in which even light particles, like splinters of wood, are revolved in these frothing eddies, can be obtained only by witnessing the operation. After returning into the eddy five or six times, depending upon the quantity of water let on, the splinter finally receives an impetus from the current which carries it over into the next corrugation, where the tossing and grinding are repeated.

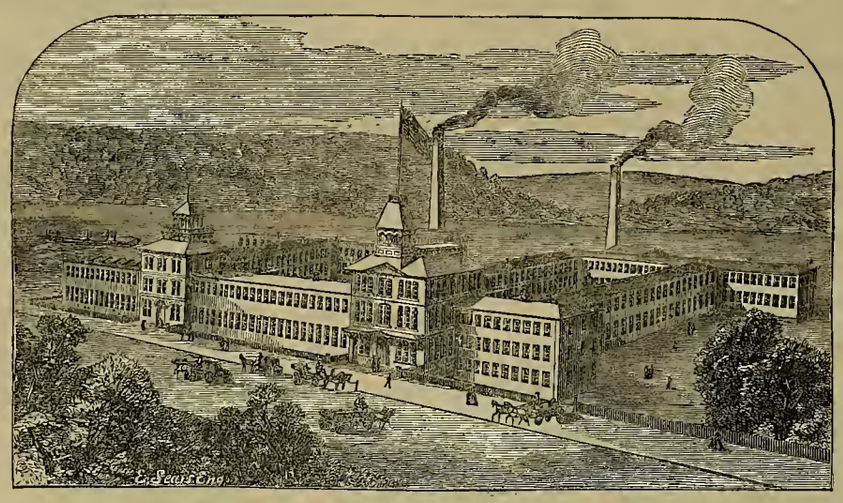
Any other shaped riffle than that of semi-circular corrugation, encounters the difficulty of caking, rendering useless the amalgamated copper surface, as well as much of the mechanical advantage of the riffles, by filling them up. Numberless experiments with riffles of differently shaped profile, made since last January, finally brought Mr. Evans to the "hollow and round;" the satisfactory operation of which seems to have won his unbounded approval, and confidence.

Every second corrugation, or hollow, has a long slit at the bottom through which the quicksilver and amalgam are enabled to escape into a series of boxes or tanks underneath, where the principle of overflowing is made use of to effect a further concentration; while the intermediate hollow which has no slit in it is intended to hold and expose constantly to the ore a small quantity of quicksilver. The dimensions of a riffle suitable for a 20-stamp mill are two feet in width and twelve feet in length, and the corrugation semi-circles, are three inches in diameter. It is claimed that this appliance will entirely supersede the use of blankets. In placer and gravel mining the same thing is intended to be applied, but made of cast iron, amalgamated by a process known to the parties interested, so as to cost but little. Where heavy stones passing over would wear down the corrugations too severely, it is proposed that they shall be protected by grate bars, which will let through only the finer dirt. It would be necessary to remove the amalgam, either on the riffles or in the boxes underneath, but once in 24 hours. From one to three pounds of quicksilver are admitted to be lost to the ton of ore, it is stated, on an average, in the treatment of Washoe rock. Mr. Evans thinks he will reduce this loss by more than half, and that the average product of $65 out of the $100 of silver in the rock, can also be materially increased. A patent has been applied for through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. Persons desiring further information, can obtain the same through S. P. Taylor, No. 319 Clay street, who is the general agent.

FIRE-PROOF FLOORING.—A new fire-proof flooring has been adopted in all the corn stores of the General Omnibus Company in Paris. It is made by spreading upon the planks a layer of clay about an inch in thickness, and running upon this a layer of asphalt about half an inch thick. Numerous experiments, it is said, have proved the efficacy of this as a protection against the spread of fire.

The American Watch Manufactory, at Waltham, Mass.

As a matter of interest to every one, who has been placed on this mundane sphere in order to learn to "take a note of time" before trying the infinities of the world beyond, we furnish our readers this week with a few facts concerning that great development of peculiarly American industry and talent—the Watch Manufactory of Waltham, Mass.—which will not fail to be read with satisfaction. The data are derived from a letter published in the New York *Tribune*, written by an excellent correspondent who visited the establishment. It is only necessary to add, for the information of Californians, that R. B. Gray & Co. of No. 616 Merchant street, are the agents of the American Watch Company for California.



The principle of making clocks by machinery, has long been applied, having driven out foreign competition. But the watch, so minute and so delicate, seemed to offer insuperable obstacles. Fifteen years ago, two sanguine, plucky Bostonians, who made watches by hand, originated a project for making them by machinery. Infusing their own zeal into neighbors, they formed a stock company, obtained $100,000 in subscriptions, and in 1854 the daring enterprise practically began. It was up-hill work; little capital; no experience; no protection; everything to learn; every stave of steel and iron to be created and fashioned before it could do their bidding. They toiled on till 1857, and then failed. Their establishment was sold under the hammer. But they had solved the problem; they were making watches by machinery.

Mr. Royal E. Robbins, on behalf of other parties, bought the establishment, and afterward, to secure himself, had no alternative but to carry it on alone. There were many dark days. Existing machines were imperfect. New ones, too, must be invented, for much work was still done by hand. Many mutations occurred; but Mr. Robbins, with unaltering faith, invested his every dollar in the enterprise, and adhered to it through all changes. He converted it into a stock association, called the American Watch Company, and he is still its treasurer and business manager.

Foreign watches are made by hand, no two exactly alike; each an individual; each subject to the nerves, caprice, idiosyncracies of the maker. But our manufacturers began by making a watch—like a steam engine—solely by machinery, and with exact uniformity of parts. They have advanced steadily, learning, improving, perfecting, year by year. Their idea was purely American; their machines have all been invented, made and run by Americans. All have originated with their own employés, just as the most ingenious improvements in California and Idaho quartz mills spring from the working mechanics and miners. Indeed, the company are satisfied that the reasons why we can make watches by machinery, while no other nation can, lies in the average native ingenuity of the American mind.

The nice minuteness of these machines is incredible. It is the crowning miracle of modern mechanism. The little scales in our national mints will weigh 1-5,000th part of an ounce of gold; but these automatic watch-makers are greater marvels. Here are instruments cutting threads, invisible to the naked eye, in screws of which 300,000 weigh only a pound! Here are exquisite sapphire knives, cutting metallic shavings of which 5,000 are required to make one inch in thickness! Here are microscopic diamond drills, boring into jewels holes like a needle-point! Here are inventions for measuring as well—machines which determine the 1-10,000th part of an inch, in pivot or jewel hole, as easily and unerring as the carpenter's rule measures one foot on a stick of timber!

The factory in Waltham is in a quiet inclosure of seventy acres, far from noise and dust. It is an immense structure, more than 300 feet long, with wings and cross-wings, inclosing great quadrangular courts. Its rooms are light and cheery, like parlors rather than the old close, foul quarters of operatives. Three quarters of a mile of work benches; seven miles of steam, gas and water pipes; 750 employés, under the ten-hour system — one-third are women, who do the work requiring lightness of touch, quickness, patience. In these qualities they excel the men. In accuracy and precision they equal them; in ingenuity they fall below. When, out of routine, one is "posed" by some new mechanical obsta-

THE AMERICAN WATCH MANUFACTORY, AT WALTHAM, MASS.

cle, her tendency is, not to overcome it by herself, but to take the refractory bit of steel, or brass, or jewel, to the bench of her nearest masculine neighbor, and ask his help.

The company make six different sizes. The largest, very heavy and solid, is humorously known as the "Boston style;" your Bostonian likes a great deal of watch for his money. The smallest is an exquisite, dainty little ornament for ladies. Ornament, because did anybody ever know a lady's watch to be right? It is always too fast, or too slow; or the key was lost last week; or that bungling jeweler spoiled it in repairing. It has not pleased Heaven to endow lovely woman with genius for keeping a watch in order.

The American watch has some obvious advantages. It is American, from Alpha to Omega. It is cheaper at first cost than foreign competitors. It is simpler; it contains less than half as many pieces, and every new piece involves a new liability to break. It is easier of repair. Besides, the higher grades are warranted perpetually against all mishaps arising from any original defect or weakness. And it bids fair to be more durable.

But how does it keep time? That, after all, is the only question. Its success must be the best answer. The character of a watch is self revealing. This, on its intrinsic merits, had to fight old prejudice, trade-combinations, established reputations. In ten years it has practically driven out of our markets the English watch, which was our staple importation and in most common use among laboring men, and largely taken the place of other less costly foreign watches. After careful testing it has been adopted as the standard on the Peunsylvania Central, New York Central, and other leading railways, where correct time is an absolute necessity. The demand for it has fast increased. At the great Waltham factory one may read its history. Here a wing, there another, beyond a third, added year by year, to meet the growing want. Every season, except 1861, when we were all paralyzed, is commemorated by some such enlargement.

The business, which was bankrupt in 1857, has grown so rapidly that eight years later the company manufactured 80,000 watches annually. It turns out a complete watch during every two and a half minutes of the working day! The single single factory in Massachusetts, under one roof and one supervision, produces more watches annually than all the watchmakers of old England combined.

This tells the story. The laws of demand and supply are unfailing registers. Other watch factories are beginning to spring up, East and West; but the American company of Waltham is the pioneer; and thus far, practically, it has occupied the field alone. Its history marks the origin and growth of an interesting and important branch of our national manufactures. It not only proves that Americans alone can make watches by machinery, watches which are cheaper, simpler, more durable, and keep better time than the same foreign grades. It is American skilled industry, working by machinery and well paid, steadily displacing European skilled industry, working by hand and ill paid.

Most American watches are consumed at home, though orders begin to come in from Cuba and South America. But sooner or later, we shall furnish pocket time-keeps to the world. It is manifest destiny.

In New York, recently, we had occasion to visit the office of Messrs. Robbins & Appleton, No. 282 Broadway, general agents for the American Watch Company. We are impressed from our intercourse that they are gentlemen well worthy of the liberal and increasing patronage with which they are meeting.

LIBRARIAN OF THE MECHANICS' INSTITUTE.—Mr. G. C. Hurlbut has just been appointed Librarian of the Mechanics' Institute, in place of Mr. J. B. Pierce, who has served faithfully for a number of years as Librarian and Assistant Librarian, and who has enjoyed the esteem and confidence of members and others. Mr. Pierce goes to farming in one of the lower counties, which will doubtless be more conducive to his health. The Board of Directors last Tuesday evening passed a resolution expressing much satisfaction with his connection with the Institute, and giving him a vote of thanks, making him at the same time a life member of the Institute for his efficient services. Mr. Riddle has also resigned as Assistant Librarian, and Mr. W. S. Stoddart has been appointed Assistant Librarian.

SANA MENS, SANO CORPORE.—If you are half sick and sad at heart, don't go to Lone Mountain, as you may be inclined to do, but take the Market or Howard street cars and spend three hours at Woodward's Gardens. You will not commit suicide—not a bit of it. *

The following is an extract from a private letter written by the Proprietors of the Plantation Bitters:

"We had no conception of the wide-spread suffering which exists, or of the almost infallible cures produced by the PLANTATION BITTERS, when we first commenced offering them for sale. We now find that every house has a weak child, an ailing parent, or debilitated aged member, who need this Tonic. Our Laboratory has grown from a single room to an immense building, and our sales from a few bottles to many hundred dozens per day, and we are glad to know that they have done you so much good. *

NOTICE.

TO ALL WHOM IT MAY CONCERN.—Notice is hereby given, that I am the first discoverer, first locator, and first Recorder of the Morey District, Nye County, Nevada, and I warn all persons from buying any interest in the said Morey mines until I prove my title to be perfect and lawful to said mines. THOS. J. BARNES.

Austin, Nev., Oct. 9, 1868. 16c17 1m

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

WILLAMETTE IRON WORKS,

PORTLAND, OREGON.

Steam Engines, Boilers,

SAW AND GRIST MILLS,

MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

Corner North-Front and E streets,

18v13-1y One block north of Couch's Wharf.

UNION IRON WORKS,

Sacramento.

WILLIAMS, ROOT & NEILSON,

MANUFACTURERS OF

CROSS' PATENT BOILER FEEDER,

STEAM ENGINES, BOILERS,

And all kinds of Mining Machinery.

Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.

Dunbar's Patent Self-Adjusting Steam Piston

PACKING, for new and old Cylinders, manufactured to order.

Front Street, between N and O streets,

14v11 SACRAMENTO CITY

Oakland Point Foundry,

Near Oakland Point R. R. Station,

MANUFACTURES

House Fronts, Sash Weights,

Range, Light and Heavy Castings of all kinds.

Having this day dissolved partnership with G. A. Walker, the business will hereafter be conducted in the name of the undersigned.

☞All orders promptly attended to.

MARTIN T. MEAD.

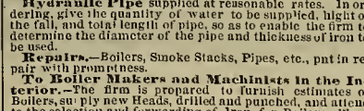
BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular **Boilers**, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.



Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

HYDROSTATIC WORKS.

SAN FRANCISCO

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Roses and Rose Sieves, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Baden & Saunders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double-acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country. I have now on hand thirteen Pumps in brass and iron, all of my own make.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom. Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair.

☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

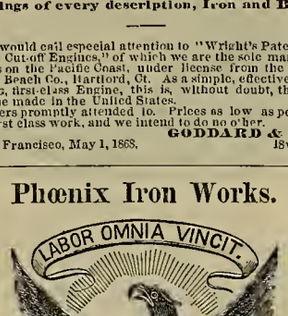
Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Chalience Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured

Castings of every description, Iron and Brass.



We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

REFRIGERATOR CARS.—One of the greatest improvements of the day is the adoption of the new plan for transporting meat from the West to the seaboard. Instead of crowding the live animals into cars, to make a long journey under circumstances which necessarily involve the most horrible suffering, those men who carry on the business humanely slaughter them in comfortable style and while they are in their best condition. The meat is packed directly into cars of a new pattern, the construction of which is thus described by the *American Railway Times*:

These cars are of the eight wheel freight pattern, built of two thicknesses of three-quarter inch pine plank, three inches apart. In the intervening space three-inch slabs of cork are inserted, cork being considered the best non-conducter of heat. On the top of the car is a flutter wheel of zinc, working horizontally by the current of air created during the motion of the train. On the same spindle with this wheel is a revolving fan, which throws the air, through flues, the entire length of the car to the ice-chambers at each end. It is here cooled and condensed, and falls through other flues to the floor, passing under the hanging meat, and enveloping it as it rises to the ceiling. The temperature maintained is forty-two degrees.

These cars can carry from 20,000 to 25,000 lbs. each, and the meats invariably come forward in excellent condition. The benefits of this system in brief are: a saving in weight to the owners of the cattle, the abolishment of slaughter houses in or near cities, the retention of the refuse matter to be returned to the soil through the compost heaps where the cattle were raised—a most important matter—and the improved character of the meat brought to market.

STREET "TRAMWAYS" IN ENGLAND.—The first act of Parliament authorizing the construction of street tramways on a scale sufficient to test their adaptability for the omnibus traffic of large cities and towns, has recently received the royal assent. The act empowers the company to lay down and work a line of tramway running from north to south of the borough of Liverpool, passing through crowded, and in some instances, narrow streets, with a hoop line in the center of the town, enabling carriages using the tramway to reach the Exchange. The act now passed was the third introduced for the purpose in three successive sessions. The two previous bills were thrown out through the opposition of the omnibus proprietors, aided by the London and North-Western Railway Company. The corporation supported the project; many of the leading inhabitants gave evidence in favor of the scheme, and there is every prospect that street tramways, on a sound principle, will at length have a fair and adequate trial.—*Colliery Guardian.*

ANNEXATION FEELING IN SINALOA.—A Mazatlan correspondent of the *Bulletin* writes:

Although the accession of Sonora, Sinaloa, etc., to the United States has been looked upon as a settled affair, your New York telegram announcing the sale of these States, took both natives and foreigners by surprise. The news soon spread over the city with almost electric speed, creating considerable sensation amongst the Government employés, whose name is legion; but relief soon arrived by a copy of Mr. Godoy's letter to the *Bulletin*, appearing in the government periodical, denouncing the rumor. There are a number of foreign merchants solely interested in the European trade and monopolizing the bulk of commerce, who naturally feel an aversion to a change that would open the market to competitors of less capital. Whereas under the present regime, with full cargoes direct from Europe, with the probabilities of an occasional revolution on the arrival of a vessel, when the merchant has the dictating of what duties he will or will not pay, are advantages not attainable under the regulated system of the American Government. In former years it was customary, upon the arrival of three or four European vessels, to pay some ex-official $10,000 or $15,000 to start an imaginary pronunciamiento, with a raid upon the city. And as the State Treasury was never guilty of holding surplus funds, the immediate necessity of means for the suppression of the rebellion would bring the Government to almost any terms the merchants proposed, so that the needful was forthcoming. The vessels in the meantime lying on and off the port until such arrangements were satisfactorily completed.

Among the native population, the more intelligent class, allowing due credit for their patriotism, anxiously await the day that these States will hold an equal advantage with California. Mechanics and laborers, in the desperation of hope deferred, look forward in reliance to the future change that will give an impetus to labor and protection to industry, when there will be a time to sow and a time to reap, and when the everlasting tremor of revolutions shall have died away. There is nevertheless a large number who live and have their being by the overthrow of law and order, born and inured to a life of libertinism and plunder, aspiring only to a fleet horse and brace of pistols, who detest the name of foreigner, knowing their avocation would be gone under a stable government, but who cloak their aversion under the garb of patriotism.

THE VALLEJO RAILROAD TERMINUS.—The pile driver is at work driving piles for the Elevator. One vessel is discharging lumber, and two others discharging ties for the railroad. The filling in between the grain and passenger wharves goes bravely on. A fine baggage and express car is nearly completed. 50,000 brick will be used in the foundation. Mr. Aiken is the brick mason. L. C. Fowler's new stores, each 25x60 feet, will be completed next week; Houghton & Lee, contractors. The Commercial Hotel, a small building lately finished by Mr. Tuckey, is full of boarders. Another boarding house is being erected near the freight wharf by Benjamin Watson, two and and a half stories high, 30x30 feet, Mr. E. W. O'Brien, builder, will be finished in two weeks at a cost of $1,200. Taylor & Jackson's new store is finished and ready for occupancy, and a store will be opened in a few days by the owners. This building is 25x40 feet, and cost about $800. *Vallejo Recorder.*

THE SMOKY ATMOSPHERE experienced a few weeks ago was extended over an immense space. Our Austin, Nevada, exchanges spoke of it. By steamer arrivals, we learn that the fog and smoke in Victoria, V. I., were so thick on Sept. 26th, that business was almost entirely suspended.

The Hawaiian *Gazette* of Sept. 16th, says: The atmosphere last Saturday morning was very smoky. Since then the heavens have been clouded, and the wind variable, with occasional light showers. The autumnal equinox is at hand, when unsettled weather may be expected.

SANSEVAIN will this year make, at his Cocomongo ranch in San Bernardino county, 60,000 gallons of wine.

A WING-DAM is being constructed at the Hog's Back, of piles and brush.

To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

NEW MECHANICAL MOVEMENT.—I. E. Palmer, of Hackensack, N. J., has recently obtained a patent upon an invention which consists in the combination of a toothed wheel with a ring having a female thread in and around it, and arranged to gear with the wheel on one side of it, the axis of the ring being transverse to that of the wheel, that in being rotated around or about the axis of the ring or the ring rotated around the wheel, serves to give a slow but powerful motion to the latter about its own axis. This movement is the reverse of the ordinary screw and worm wheel, and applicable to a variety of purposes, including, among others, the take-up action of a rope machine or apparatus.

It is the best, cheapest, and simplest Press ever invented. Gives perfect satisfaction to all who purchase, and is pronounced by all a "perfect success. We have sold many of them to Postmasters, Printers, Druggists, Clergymen and all classes of business men, and they are making and saving money by using them at their homes and places of business.

Price of Presses, $8, $12, $16, $24, $30. Price of Offices, $15, $20, $30, $42, $18, $50. Send for Circular to LOWE PRESS COMPANY, 3 Water street, Boston. 4v17tf

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash-boiler. It is a sure thing to stick when resin and solder will not. It will stand beat as well as any solder ever used over fire

PACIFIC STATES AGENCY, 418 Montgomery street, San Francisco. AGENTS WANTED. 6v17tf

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,

BUERK'S

Watchman's Time Detector.

THIS WATCH CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is, invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16-6m

QUARTZ MILL WANTED.

Any person knowing of a good second-hand Quartz Mill and Engine—about five stamps—will please address, with price, "A. B. C., care of Mining Press, San Francisco." The Mill is wanted for Mariposa County. Estimates for a new five-stamp Mill and Engine of suitable capacity solicited. 13v17-2w

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have his name on the subscription books.—*Nevada Gazette.*

Extraction of the Precious Metals with Melted Zinc.

In mentioning the formation of a matt as one of the objections to the Fuller process of passing sulphureted ores through melted lead for the extraction of gold and silver (in our last number), the statement was added that in the zinc process the result would be the same, with the additional aggravation of a greater liability to the oxidation of the zinc. To these words Mr. d' Heureuso, the patentee of the zinc process, takes exception, as doing injustice to his process; and so far as the formation of a matt is concerned, perhaps with some cause, since the affinity of lead for sulphur is very considerably greater than that of zinc; and though a zinc and lead matt is the regular daily product of all the Swansea and Saxon smelting furnaces, whether by cupola or reverberatory treatment, it is probably always under the accompaniment of either zinc or lead ores, the distribution of which is so universal in the form of blende and galena, while the formation of a pure zinc matt, when neither blende nor galena are present, would not, except under peculiar and favorable conditions, be likely to take place. But Mr. 'd Heureuso being a meritorious inventor and a gentlemen of scientific acquirements, especially in the technological branches, it will be worth while to peruse his own views, given from an inventor's stand-point, concerning the difficultios that have to be encountered by good, as well as by indifferent inventions, before they have been unequivocally demonstrated. He writes as follows:

EDITORS PRESS:—A statement in your article, "Proposed New Metallurgical Uses of Zinc and Lead," (page 233) requires correction and explanation. Melted zinc will not combine with sulphur on passage of sulphurets through it, the affinity of zinc to sulphur, unlike lead, being restricted to other vastly different conditions. The oxidation of zinc hy a coverod surface is not oxcessive, the cost of zinc lost in the operation being about $2 per ton of ore, and the cost of working very insignificsut, not much if any exceeding that of amalgamation. The reasou for the apparent neglect of this method, may be fouud in the fact that his full time has been given of late to his patented Air Fermentation, during the present wine season, considering this of the utmost importance to the wine interest of the country. That accomplished, he will not be slow to produce proofs of the practicability and profit of the zinc process for gold extraction, of which every expert now could convince himself by using a crucible and a pipe with which to introduce the ore.

In conclusion, Messrs. Editors, a general mark on improvements may be admissible. It takes almost invariably a long time till the public accommodates itself to the idea that a better method on perfectly different principles than those in use can be and is devised. What they have they consider near perfectiou; they know it,—the new process they don't. The great mass is always more inclined to blindly condemu what they do not understand—particularly something simple, but new to them—than to calmly investigate, and thereby benefit themselves. We see continuedly learned and unlearned men go into laborious arguments to disprove the correctness of some proposed technical process, while a simple experiment would convince them of its utility. Thereby progress is retarded, while inventors—especially with limited means—find increased the difficulty of their ungrateful task,—to couvince a public that refuses to be convinced in spite of the obvious enormous advantages it would derive.

Everybody with a bellows or similar contrivance could convince himself by a trial on a small scale of the efficiency of air for fermentation and germination, and how many really make the experiment? One waits for the other to do it, and in the meantime all but the most intelligent content themselves with the absurd notion that air into must or other fermentating substance *will* make vinegar. This is one of numerous instances. If nothiug is heard for a while of the practical adoption of a certain asserted improvement, the public is pleased to insinuate (insinuation, mind, is a more powerful weapon than proof) it to be a failure, and reasons are hunted up for their disbelief, without giving the struggling invention the benefit of the doubt. Human nature, that fondly believes what goes beyond human ken to comprehend, refuses to be convinced by the evidence of common sense; mystery is attractive, while plain truths and common sense are always stoned at first. Let us be just. R. d'H.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-ann

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

17
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instantly. It is a balmy liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 549 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

New Mining Advertisements.

Cordillera Silver Mining Company, Morelia District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of October, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Monday, the seventh day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

And in accordance with law, and an order of the Board of Trustees, made on the second day of September, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, in Front of City Hall, corner of Kearny and Merchant streets, San Francisco, California on the twenty-sixth day of October, 1868, at the hour of 10 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WALES L. PALMER, Secretary.
Office, No. 19 First street, San Francisco, California. oc10

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

Chipiconna Mining Company--District of Ures, Sonora, Mexico.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the seventh day of September, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Moschelmer, Jos	26	25	$125 00
Moschelmer, Jos	27	26	130 00
Smith, R	86	5	25 00
Quhi, Thos	25	5	25 00
Anderson, J	94	29	145 00

And in accordance with law, and an order of the Board of Trustees, made on the seventh day of September, 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salerooms of J. Middleton & Son, 310 Montgomery street, San Francisco, on the twenty-sixth day of October, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOUSE, Secretary.
Office, 318 California street, up-stairs, San Francisco. oc10

Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 4th day of February, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Lewelling, J	303	8⅓	$16 67
McNamara, Mary	183	8⅓	16 67
Peterson, Geo C	179	5	10 00
Peterson, Geo C	240	25	50 00
Remington, J C	295	1	2 00
Weber, C M	32	50	100 00
Weber, C M	33	50	100 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of September, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by R. R. Rollins, auctioneer, at salesroom No. 522 Market street, San Francisco, California, on Monday, the twenty-sixth day of October, 1868, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. A. COOLIDGE, Secretary.
Office, Room 40 Merchants' Exchange Building, California street, San Francisco, Cal. oc10

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of October, 1868, an assessment (No 26) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 25 Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the tenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 25 Merchants' Exchange, south side of California street, between Montgomery and Sansome streets, San Francisco, California. oc10

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of September, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the tenth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. sep19

Providence Gold and Silver Mining Company, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of September, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of October, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. sep19

Silver Sprout Mining Company.—Location of Works and Mines: Kearsarge District, Inyo county, Cal.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of August, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Alberding, F H	16, 17, 26	3	$90 00
Devlin, Bendere & McMillin	not issued	2	60 00
Gray, T C	63	7	210 00
McLaughlin, J W	74	50	1,500 00
Martinez, Sendislao	20	4	120 00
Wingard, A	22, 50, 53	16	480 00

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of August, 1868 so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the twenty-first day of September, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. sep5

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, the twenty-first day of October, 1868, at the same hour and place. By order of the Board of Trustees.
sep19 T. B. WINGARD, Secretary.

Washington Mining Company.—Location of Works: Nevada County, California.

The regular Annual Meeting of this Company, will be held on SATURDAY, THE THIRD DAY OF NOVEMBER 1868, at one o'clock P. M., at the office of the Company, No 318 Front street, San Francisco.

JOHN J. SCOTCHLER, Secretary.
San Francisco, Oct. 10, 1868. oc10

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

Machinery.

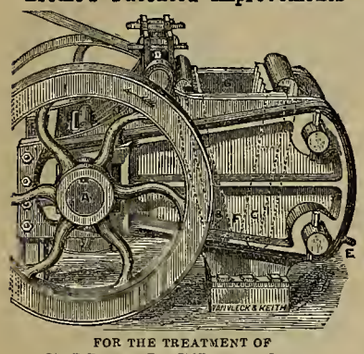
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price $600

No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. R. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16-3m

NATIONAL ACADEMY OF SCIENCES.—We quote the following from the proceedings of the National Academy of Sciences, which met at Northampton, Mass., during the last week in August,—as reported by the *American Journal of Mining:*

On Wednesday morning Prof. Whitney discoursed on the topography and on topographical work west of the 103d meridian. He exhibited numerous excellent maps constructed under his supervision by the assistants of the California Survey, and proved to the satisfaction of all that he had been no idler during his long sojourn on the shores of the Pacific. Not only has he conducted the complicated machinery of his commission, but almost entirely at his own expense, he has caused extensive surveys to be made in nearly all the adjoining States and Territories. The maps exhibited covered nearly all the wall of one side of the room, and were hung from railings, blackboards, and almost every other available point, and still they are but a small portion of what he has done.

The economical spirit of the last legislature of California, cut the survey short in the midst of its usefulness, and would have consigned all this valuable work to oblivion, were it not for the energy and enterprise of the Professor. It is to be sincerely hoped that the next legislature will see the folly of such a step, and, while redeeming the reputation of the State, give him the opportunity of completing what he evidently considers his great life-work.

The paper was followed by comments from Prof. Peirce, Mr. Lesley, and Prof. Guyot, all supporting Prof. Whitney's idea that the general government should organize a thorough topographical survey of the public domain. * * This was followed by a paper by Mr. Gabb, late of the California Survey, on the subdivisions of the cretaceous and marine tertiary formations of California, which excited some criticisms from Mr. Lesley.

On Thursday Prof. Whitney, by special request, read an account of the discovery of the fossil skull, supposed to be the remains of Mr. Bowers, of Missouri,* together with some remarks on its geological position, and followed it by some remarks on other antiquarian discoveries.

* ! ! ! [EDS. PRESS].

RAILWAY SIGNALS.—The same system of signalling is in use upon the English and French lines. When the arm of the semaphore is raised, and the red light exhibited—the latter, of course, only shows at night—the passage of the approaching train is barred. So soon as it is lowered, either partially or altogether, the train may proceed, while the lowering of the arm at night is accompanied by a change of the red light to green or white, according as the descent is partial or complete. The contrary rule is in force upon the German lines. The signals there are raised not to arrest but to permit the passage of the train. In dense fogs detonating signals are employed. These are generally placed upon the rails by hand, and the explosion is a warning to the driver and guard to pull up at once. By a most ingenious method, the Lyons Company adopt them to act in consonance with the signals. A couple of detonators are placed alongside the rails at about a quarter of a mile distant from the signal post or station, and in time of fogs they are attached by connecting rods to the signalling gear. Directly the danger signal is up these "crackers," as they may be called, are lifted on the metals, and their explosion is an indication to the driver that the road is barred.—*Mechanics' Magazine.*

A SHEEP-WASHING machine is used by Australian wool-growers, which perfectly cleanses the wool so that its market value is greatly increased. A portable engine is used to throw water into a tank, to give eight feet fall. Several sponts are provided, which throw into the living wool thin films of water, two and one-half feet wide by one-eighth of an inch thick. This searches well into the wool and deterges it perfectly for the shearer. The cost of a twelve-horse engine and everything complete is $3,000.

A CONVENTION OF MINERS was recently held in the city of Mexico to lay before the Government the necessity of a general reformation in the mining laws; chief amongst which was the proposition in favor of the free exportation of silver. Under existing laws and protection the mining interests in Sinaloa, it is maintained, will die a natural death. With the exception of the Tajo mine there is no other mine of note at work in the State.

GEOGRAPHICAL CURIOSITY.--An instance is mentioned by Capt. T. O. White, of the British Ordnance Survey Office at Edinburg, of a stream near its source dividing into two courses at a main watershed, and discharging by double outlet into two distinct systems of drainage. This feature occurs a few miles from Comrie in Perthshire, at the head of Glen Lednock, a tributary of the river Earn. A small rivulet rises under a craggy hill, one of the "Meal Buidhe" range, which separates the drainage of the Tay and Earn. The stream for a short distance takes the course of a well defined gully, till it opens out into a small and comparatively flat area. So far its direction has been with the main watershed ridge. Arrived at the flat ground, which is boggy and broken up into what are termed in Scotland "peat hags," it has reached the point where its waters split off into two branches, one making for Loch Tay and becoming the "Finglen Burn," the other descending, by way of Glen Lednock, into the Valley of the Earn. This divergence is caused by a very slight but immediate rise on the lower side of the fork, gradually swelling into a shoulder, or hump, which becomes a continuation of the shedding ridge. When Capt. White visited the spot last November, there was a decided run of water both above and below the divergence. A very slight deepening of either at the fork would turn the balance, but at present there is no doubt that the head streamlet has naturally selected and is using them both.

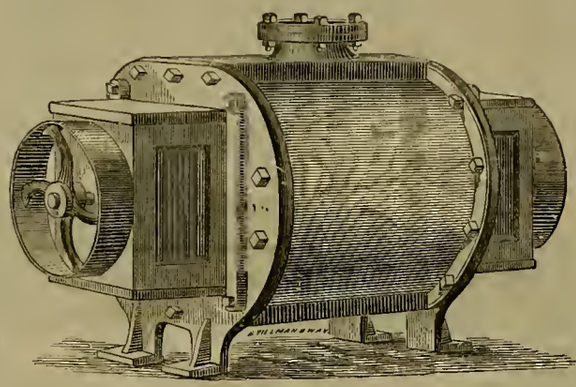
THE TENDENCY OF GOLD.—The continued heavy drain of coin and bullion to foreign countries, in liquidation of our trade balances and to meet the interest on that portion of the debt held abroad, is beginning to excite grave apprehensions of financial disaster, particularly as there continues to be an undue preponderance in the import trade. To this unsatisfactory state of affairs, in connection with the doubts and fears engendered by the action of leading politicians, touching the obligations of the Government, is undoubtedly due to the late rise in the gold premium; and as no steps are likely to be taken for the present to bring about the just equilibrium of our foreign commerce, a still higher range for gold during the remainder of the year would seem to be altogether probable.

The circular of a prominent banking house of this city, says: "Indications are not wanting that our foreign trade is approaching a crisis, the character and importance of which are but partially appreciated. Owing to the deficiency of our home production, we have, for the last five years, imported foreign products largely in excess of the ordinary means of payment, viz., produce and the precious metals, and the resulting deficiency has been set off by the remittance of the United States securities to the extent of $70,000,000, or say one-third of our whole gold interest debt."—*N. Y. Trade Journal.*

LABOR AND WAGES IN THE "OLD COUNTRY."—Laborers in England have as a general thing all the comforts that poor men seek, and enjoy life in a much greater degree than they could expect in this country. The industrial cooperative movements, which are now gaining ground with extraordinary rapidity, tend to render them satisfied with their own country. They have besides a more intense national feeling, than is usually found among the lower classes of any other European nation. This makes them look upon America as the last resort—as a place to which absolute necessity should alone drive them. They are in many respects happier than our own working people, because they do not hope to stand beside the class above them, and consequently they do not struggle against their condition to imitate the manners and habits of that class.

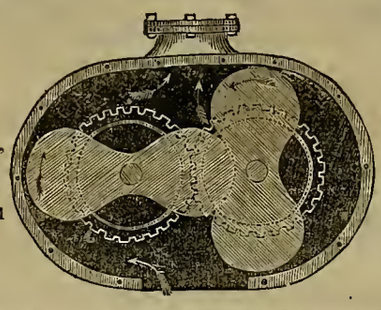
In Ireland, labor is a drug, and is usually of the poorest kind. The average of a man's wages, there, is about one shilling per day—of a woman's sixpence.

In France, the working classes are better off than in any other foreign country, except, perhaps, Norway and Sweden, where there is a veritable John Bright's paradise. In Paris, wages are from twenty-five cents to $5 per day; but the average is $1 for men and from thirty to forty-five cents for women, a day's work being twelve hours.



SUCCESS rides on every hour; grapple it and you may win, but without a grapple it will never go with you. Work is the weapon of honor, and he who lacks the weapon will never triumph.

THERE are 238 acres of tobacco in the vicinity of Gilroy.



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

PROF. HENRY WURTZ,

Formerly Chemical Examiner in the U. S. Patent Office, may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures, Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞ Written communications preferred.

Important to Gold and Silver Miners and Companies.

PROFESSOR WURTZ,

Who is the Inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of

SODIUM AMALGAM.

All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17

G. W. STRONG,

ASSAYER AND WORKER OF ORES,

No. 10 Stevenson street, near First, San Francisco.

Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Specimens, etc., etc. Smelting manipulated in all branches of Metallurgy, on liberal terms.
14v15qr.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16m

NOTICE.

On and after this date, all parties on the Pacific coast manufacturing, using, or selling

Dunbar's Patent Piston Packing,

must obtain a License for the same from the undersigned or they will be subject to the penalties of the law.

H. S. SMITH,
Ætna Iron Works.
San Francisco, August 15th, 1868. 7v17-3m

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.
☞FIRE AND MARINE INSURANCE. 10v14t9pqr

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

SAFETY FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.

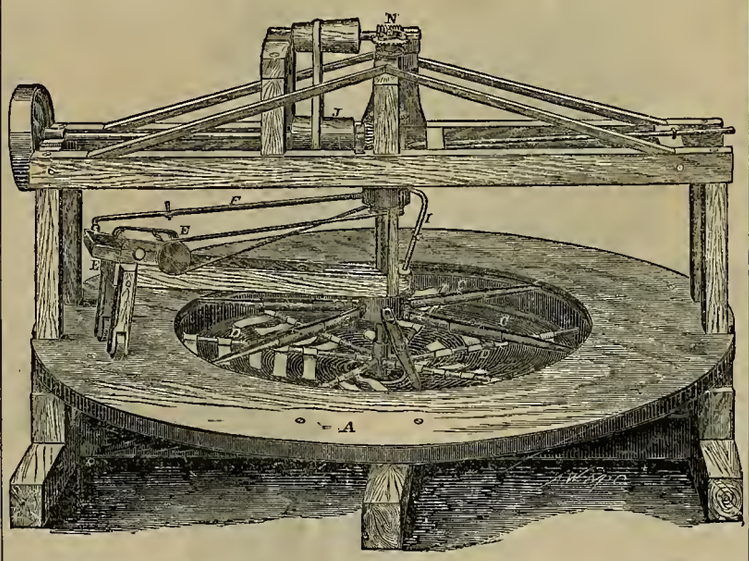
PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for Sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.

A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.



MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made
Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.
13v17tf

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Salphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE, STEPHENS & HARRY.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 15 Cents.

California Academy of Sciences.

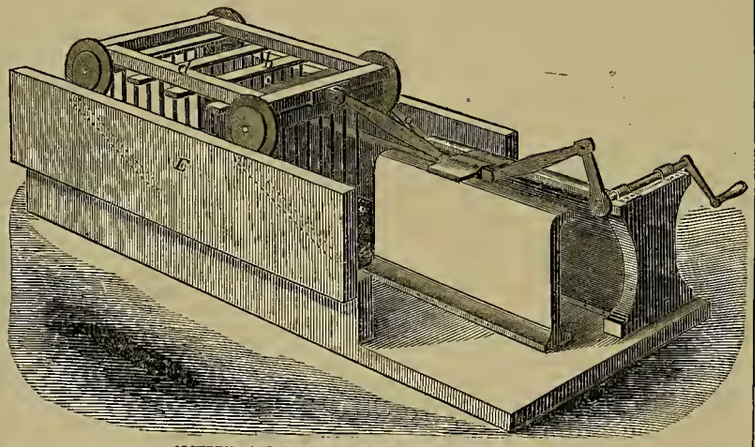
A regular meeting of the Academy took place on Monday, October 19th, President Blake in the Chair. Mr. Brooks, Secretary, and nine members present. Proposed for membership, Mr. Amos Bowman. Donations to library: 4 geological maps and pamphlets of the kingdom of Sweden; Proceedings of the Society of Natural History of Prague, Bohemia; Transactions of the Academy of Science, St. Louis; Proceedings of the Royal Geographical Society, London, and Anniversary Address before the same; American Naturalist; Monthly Series of the MINING AND SCIENTIFIC PRESS for August and September; Russian America and the Stickeen River, from Smithsonian Institute; Catalogue of Birds found in Costa Rica; West India Cyclone.



Mr. Theodore Bradley read an able address on the "Value of the Study of Science in its Historical Relations." He gave a summary of the scientific discoveries of the ancients, and an account of the theories built upon them, showing the fallacy of their conclusions in consequence of their deficient knowledge of science. Had they taken pains to explore the hidden mysteries of nature and to accumulate facts before constructing systems of the universe and accounting for the phenomena of the earth, their philosophy and science would not have been deformed by such absurd theories as we now find attributed to them. He pointed out the dawn of correct science and traced its progress to the present time. At the close he made some experiments in hydrostatics to illustrate some of the principles developed by the ancients. The first experiment was designed to show that the pressure of a large column of water on a disk of a certain size is no greater than that of a smaller column of the same hight on the same disk. The second proved that the loss of weight of a body immersed in water is equal to the weight of the volume of water displaced. The third experiment proved that the lateral and the vertical pressure of water are equal.

The lectures are to be continued, and their interest and value deserve a larger audience than was present at the last meeting. Adjourned at 10 o'clock.

NO MORE POISON SWEETMEATS.—Dr. Artus shows how a beautiful green color devoid of poisonous properties can be obtained. Five gallons of saffron are shaken up with a quarter of an ounce of distilled water, and the mixture allowed to stand for twenty-four hours; at the same time four grains of indigo carmine are shaken up with half an ounce of distilled water and the mixture also allowed to stand for twenty-four hours. At the end of this time the two solutions are mixed together, which produce a very fine green solution capable of coloring no less than five pounds of sugar.

Oliver's Raking Machine for Concentrating.

Mr. Allen Oliver of Jamestown, Tuolumne County, has added another mechanical contrivance to the numerous devices which have been brought into use to assist the forces of flowing water, and specific gravity respectively, to take with them in different directions, the lighter and heavier particles of ores. This is nothing more in principle than a stirring machine; a carriage having teeth, reaching into the ore accumulated in the sluice by a cross piece or dam, and moving against the current,—as will be readily understood from the accompanying illustration. The carriage moves up on inclined ways inside of a common sluice, and is dropped from their end so as to sink the teeth into the sand and debris which contains the gold and sulphurets. It is thus caused to move up the sluice against the current, moving on ways beneath the inclined series, stirring and moving the sand, and allowing the heavier portions to settle, while the lighter portions are carried away by the action of the water.

OLIVER'S STIRRING MACHINE FOR CONCENTRATING.

Any number of these carriages may be placed in a sluice, all operated by the same power. In the rear of each car is placed a gate against which the sulphurets and sand will lodge when carried down by the water, in order that they may be successively subjected to the action of the teeth, and consequently separated.

The operation is described as follows: The ore after being crushed in the mill and put through the usual amalgamating process is conveyed with water into the sluice or flume and is then what is termed tailings. These tailings are carried down until they lodge against the gate, where they accumulate; the car is then set in motion and moves up the inclined ways, and drops from their upper ends burying the teeth in the sand; it then moves up the track lifting the inclined ways and passing beneath them and at the same time the tailings are agitated by the teeth, moving the sand, which is carried down the incline and over the gate by the water allowing the sulphurets, by their superior specific gravity, to seek the bottom; the temporary eddy caused by the teeth aiding them in settling. This operation is repeated, while the sand and any particles of gold or sulphurets which have escaped with the water are caught by some of the succeeding gates and settled in a similar manner to that above described. In this manner, and with this apparatus, the sulphurets and particles of gold and quicksilver are saved without the aid of blankets or other device used for that purpose; the sulphurets are left in a clean and natural state ready to be removed for chlorination or smelting.

To remove the sulphurets and other particles which may be left in the sluice, the tailings may be turned from the mill into a second sluice which is provided, similar to the one described, and a stream of fresh water is turned into the sluice, which carries away the sand which has not yet been passed off; the gates are then removed, when the water will carry the sulphurets and other particles down the sluice where they may be deposited in a suitable receiving vessel.

The working portion will be about 24 inches in width, and 40 to 50 feet in length. It can be driven either by steam or water power. For two months past this invention has been applied to the test of practice in Tuolumne county, under the auspices of Mr. Oliver, who is an old miner and a very well-known citizen.

A patent has been applied for through this office.

KYANIZING.—On the Chicago, Burlington and Quincy Railroad, the ties are placed in a tank of boiler iron ten feet square and seven feet deep, and tightly covered. Carbolic acid sufficient to cover them is let in and raised to a temperature of 245 degrees, by the application of steam. Here the ties remain for thirty hours, at the close of which they are thoroughly permeated with the carbolic acid and become as black as charcoal.

The Orchids.

Most Californians have heard of the Mexican plant whose exquisite blossom, called the "Flower of the Holy Spirit," has in its center the perfect semblance of a beautiful white dove. This is the Peristeria, one of the Orchids; a family of flowering plants which is remarkable for its many peculiarities. Unlike those of most plants, its blossoms assume *all* forms. Even upon the same stalk, will often be found half a dozen different flowers, which are so unlike each other as to have been previously referred by botantists to different genera. Besides this irregularity, they frequently take the form of various insects and reptiles. Bees, flies, spiders, toads, etc., etc., are found represented by them in perfection,—even with the utmost exactness of detail.

At least three thousand different species of Orchis have been described; and,—says C. M. Tracy, in the *American Naturalist*,—"no one supposes that more than a beginning has been made." One botanist says that "a whole life would be too short for the figuring of the Orchids of the Peruvian Andes alone." They are found in all parts of the world, in all climates and in all soils. Some species grow up in the cold bogs of the north; others are found only amid the luxuriant vegetation of the tropics. Some are of marvellous beauty of form: others gorgeous in their brilliant coloring. Some give out a wonderful fragrance of extraordinary power; others breathe forth only the most delicate perfume. Some are found as small and unpretending shrubs in secluded places; others swing in gay festoons from the topmost branches of the highest trees. "Varied,—says Mr. Tracy,—with an excess that is perfectly reckless and prodigal, a new form meets the observer at every turn."

Amid such diversity of feature and habit, how then are we to recognize the members of this family? Are there any distinctive marks by which we may know them? Mr. Tracy give us the three following characters, which he says are always constant. First,—irregular flowers; Second,—Stamens and pistils consolidated; Third,—Seeds around the sides of the pod—not around its center. If we find a plant in which these three occur together, "we are safe in looking up to it as a well-accredited member of this regal order."

The royal character of the family is,—Mr. T. thinks,—the more marked, inasmuch as that while incomparable in its exhaustless beauty, hardly a family among plants has so little known utility. The Vanila, the Salep, the Coral-root, and the Ladies' Slippers, are almost the only members of it which can be said to have any commercial value.

DEATH OF AN EMINENT CHEMIST.—Schönbein is dead. He was the discoverer of ozone, and the inventor of gun-cotton. He was born in Wurtemberg Oct. 18, 1799. At the age of 25 he was appointed Professor of Chemistry at Reihau; and later in the University of Basel. He is the author of several works upon scientific subjects.

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

[Continued from page 242.]

The sides of these cracks or fissures would also be frequently more or less dislocated, and so form lines of faults interrupting the previously regular contour of the surface, and forming the first elevations or mountains on the globe, which, by giving direction to the action of the water in the ocean and rivers, would in a great measure determine the main features of the physical geography of this epoch. Nor would these features be readily obliterated, since by in turn giving direction also to the deposition and demarcation of sedimentary matter, their primeval influence, when not counteracted by subsequent cataclysmic action, might be handed down through long ages and formations, even in some cases to the present period.

We have now concluded what might be termed the chapter of Genesis, or the cosmogenetical era of the history of the earth, since from this period up to the present day I regard all the changes which have taken place in our globe as having been affected by agencies similar, if not identical, with those now in operation. Sedimentary rocks were formed from the wearing down and disintegrating action of water and the atmosphere, or as it is termed, the weathering of the primitive crust, and the subsequent stratification of the *debris* so formed by the action of rivers and of the sea, just as at the present moment they are in the course of formation from the *debris* of pre-existing rocks. Eruptions of igneous matter from sources in its interior from time to time disturbed and broke through the primitive crust, and the rock strata above it, in course of formation from its *debris*, just as at the present day (though possibly on a somewhat smaller scale) similar outbursts are produced by volcanic action.

The primitive crust of the earth, split up as before stated by the effects of contraction, would be further broken up and pulverized by the mechanical force of water, powerfully assisted by the disintegrating and decomposing action of the carbonic acid present in such great excess in the primeval atmosphere, and thus would in process of time be so comminuted as to enable its particles to be sorted by the action of rivers and the sea, which would arrange them in sedimentary beds of varying density and character.

A large portion of the quartz, more or less free from other silicates, would at once be formed into beds of sandstone and grits; the silicates, however, would first undergo a partial decomposition from the action of carbonic acid and water, causing the removal of a large portion of their alkalies, which would be carried into the sea in the state of carbonates, and there react upon the earthy and metallic chlorides contained in the ocean. Particles of metallic sulphides entangled in the silicates (for as before stated no mechanical separation according to densities can be in nature regarded as perfect) would become oxidized into sulphates and also carried into the sea, which would receive a further amount from the gaseous compounds of sulphur which are supposed to have accompanied the outbursts of igneous matter from the interior of the globe.

The partially decomposed silicates, along with more or less quartz, would, by the action of the sea and rivers, also be sorted, and deposited as sedimentary beds, forming the argillaceous and areno-argillceous strata of that period, which were subsequently altered in character by metamorphic action.

The development of organic life, at first of the lowest type, would now introduce another character of deposits into the sedimentary series, as by abstracting the lime contained in the ocean (in the form of carbonate, sulphate, and phosphate, the two latter compounds being the probable source of the sulphur and phosphorus which play so important a part in the vital economy of both animals and plants), this would gradually afford the materials for the building up of limestones and calcareous strata, whilst at the same time vegetation, by assimilating the carbonic acid in the atmosphere, would, from the remains of its organic structure, also introduce beds of carbonaceous character into the series; and further, by clearing the atmosphere of the overwhelming excess of carbonic acid originally contained in it, and returning a corresponding amount of oxygen to the air, it gradually paved the way for the increased development of animal life, and eventually effected the purification of the atmosphere to such a degree as to permit of the existence of air-breathing animals upon the face of the earth.

By these means, therefore, we are enabled to explain the formation of the more important classes of rock masses which characterize all sedimentary formations from the most ancient up to the most recent, namely: the arenaceous, argillaceous, calcareous, and carbonaceous strata, with the numerous deposits of intermediate character formed from a greater or less admixture of the materials of two or more of the above.

These causes would operate through all time; for although in the first instance or commencement, they could act only upon the primary crust and its *debris*, they would in later ages have a far larger field for work in the destruction of all the stratified and unstratified rocks preceding them, and the reconstruction of new formations from their ruins.

The formation of these sedimentary strata, did not proceed uninterruptedly, however, for any longer period; for from time to time outhursts and intrusions of the igneous matters contained in the earth below, disturbed and broke through the strata* forming dykes, ramifications, and bosses, as well as sheets sometimes overflowing, and at other times intercalated between the beds themselves. Showers of volcanic ashes may, probably, in some instances, have accompanied these outhursts, and by falling upon the land, or into the sea, have formed beds in the series of a totally different character to those before alluded to, which were merely derived from the breaking up and disintegration of previous rocks, or from the action of organic life. When currents of lava from these eruptions poured into the sea, or forced their way from below up through the bed of the ocean, the igneous matter would be converted into tuffs; that is to say broken up, disintegrated, and so brought into a state of division more or less fine, in proportion to the greater or less cooling action of the water mass in immediate contact with it. The action of the waves would then assist in spreading out these igneous products, and arranging them in beds similar to those of ordinary detrital origin, whilst the texture of such beds would vary from that of the coarsest breccia down to the finest mud, and, as is commonly the case, such deposits present themselves as alternating beds of coarse and fine character. Upon the consolidation of such masses, rocks are formed, closely identical in chemical and mineralogical composition to the original eruptive rock from which they were derived, and in external appearance, particularly when close-grained, often undistinguishable from it by the naked eye; in most cases, however, the microscope can distinguish between them with certainty; but it has long proved an enigma to both the chemist and the geologist, when he finds a rock taken out of an apparently normal stratified or sedimentary deposit, to have the same chemical composition as one of undoubtedly eruptive or igneous nature.

To the difficulty in discriminating between such rocks, I attribute in great measure the conflicting opinions which have divided geologists as to the origin of granites and various other of the older plutonic rocks, and my experience in the field, assisted by the microscope and laboratory, has satisfied me that very many of the so-called granites and gneises are really sedimentary products of the breaking up of true igneous eruptive rocks, stratified by aqueous agency, and subsequently, as it were, reconstructed or consolidated. At the same time, however, I have also come to the conclusion that there also are true eruptive granites of igneous origin, *i.e.*, the products of action similar to volcanoes, the only apparent physical distinction being that probably the conditions of pressure may have been somewhat different in the older periods.

This is a point of great interest and importance in the study of the older rocks, and therefore I will attempt to answer the arguments which I find advanced against the igneous origin of granite, not by a reference to authorities on the subject, but by what may be called volcanic facts, that is, data obtained in the examination of the mineralogy and petrology of volcanic districts. The main arguments brought against the probability of the aqueous origin of granite and several other plutonic rocks are—

1.—That granite contains free quartz. As before stated, this is also the case in many volcanic lavas, and the remarks made on this subject, when considering the possibility of the presence of free silica in silicates, are all applicable here.

2.—The quartz in granite is of specific gravity 2·6, or the same as that of quartz of aqueous origin; as previously stated, this is also the case with the quartz from volcanic lavas.

3.—The quartz from granite contains water.

This is also the case with the quartz out of the rocks of the volcanic island of Ponza in the Bay of Naples, and in the volcanic lavas from Peru.

4.—That in granites, some of the more fusible minerals have often solified and crystallized before the less fusible ones.

In the lavas from Vesuvius it is common to find crystals of refractory leucite sitting upon the easily fusible augite, which had crystallized first.

5.—That granite frequently contains hydrated minerals.

The quartz, feldspar, nepheline, and idocrase from Vesuvius all contain water. A specimen on the table, broken out of the lava current of March, 1865, whilst still flowing from Ætna, contains crystals of stilbite.†

It appears to me, therefore, that when the facts and arguments on both sides of this question have been impartially considered, the conclusion will be drawn that there are true eruptive igneous granites, and that the arguments advanced against the igneous origin of granite are inconsistent, as well as inconclusive.

*These eruptive rocks, in cooling, become solidified first at the exterior, and by contraction are frequently, more especially when in large masses, split up by joints and fissures, which occasionally might be filled up by the still liquid part forced into them from below by the general contraction of the mass of rock; this accounts for what may be called cotemporaneous veins in these rocks, which in general present a different external appearance to that of the rest of the rock, owing to different conditions of cooling and crystallization from that of the rest of the mass. As acid silicated rocks, like granite, contract more in cooling than basic ones, like dolerites, these veins are found to occur more commonly in the former than in the latter. They must not, however, be confounded with those veins or dykes produced by subsequent eruptions of igneous outbursts, cutting through the previously erupted rocks in later geological periods.

†Bunsen has proved experimentally that hydrated silicates, analagous to those in eruptive rocks, can be formed at high temperatures, and retain their water at such temperatures, as long as inclosed in their matrix; if extracted from this, however, the water contained in them can be expelled at a very gentle heat. Laurent has also shown that borate of potash fused at temperatures above the melting point of silver retains water which, singularly enough, can be expelled in bubbles by reheating the vitrified mass over a spirit lamp so as hardly to soften it.

[To be continued.]

DEATH OF A PIONEER AND WORKER.—Sandwich Island newspapers report the death of Judge Andrews, of the Hawaiian Supreme Court. Respecting his life and labors, an able correspondent of the *Times* says:

The Hawaiian College at Lahaina-luna, the Hawaiian *Press*, and the Hawaiian Dictionary all, owe their origin to the untiring efforts of this useful man, who died at his residence in Nuwanu Valley, on the 29th of September, at the age of seventy-three. The Lahaina-luna Seminary was opened under his supervision, in 1831, and very soon after he commenced to edit the *Lama Hawaii*—"Light of Hawaii"—which, as near as I can ascertain, was the first paper ever issued in the Pacific, on continent or island. He afterward became Judge of the Supreme Court, and has always been a most esteemed and worthy man and citizen. His researches in the Hawaiian language, history and songs have been very extensive and patient. For some time past blindness and paralysis have laid him aside from active effort of any kind.

HAWAIIAN CONCHOLOGY.—Dr. W. Newcomb, whose large and well known cabinet has been transferred to the Cornell University at Ithaca, New York, has been visiting Honolulu and other parts of the Hawaiian group, searching the reefs and bays for specimens to add to his collection. A number of rare shells have been secured, and he takes with him by the steamer East, as the result of his few weeks' labor, a collection which an amateur would consider very extensive. The land shells of those islands were thoroughly worked up by Dr. Newcomb during a previous residence of five years, and were described and figured by the London Zoölogical Society and also by the Natural History Societies of New York and Boston, in their journals. Hawaiian marine shells yet await some one to make them a specialty. Doctor Newcomb will spend the winter at the University, setting up and arranging the conchological cabinet.

MINERALOGY.—The Cornell University has bought the private mineralogical collection of Professor Benjamin Silliman, of Yale College, one of the most varied and valuable private collections of mineral specimens in the country.

The Sun's Heat as a Direct Motor.

The *Scientific American* publishes a communication in which the writer, in view of the facts that so large a proportion of the heat in the steam engine is lost through friction, and that the world's supply of fuel must eventually fail, makes a novel suggestion for the direct utilization of the heat of the sun as a motor, without the necessity of having recourse to the same stored up as power in coal beds or in forests. This might, he says, be done as follows: An inclined plane or railroad, having placed thereon a heavily-loaded car, with pawls attached, playing in ratchets by the sides of the rails, so that it should be prevented from descent;—also, having a long bar of iron or other metal fixed to the lower end of the car with a movable joint, so that the lower extremity of the bar should lie upon a central ratchet lying parallel to and between the rails,—would operate thus: the long bar would expand by the heat of the sun, and, being prevented by the central rachet from downward motion, would push the car up the inclined plane. The side panels and rachets would hold it there, so that upon subsequent cooling the bar would be drawn up, and, taking a new hold upon the central rachet would, when heated again, push up the car. In this way, step by step, through successive days and nights, the car would be lifted to the top of the inclined plane, precisely as a tin roof sometimes crawls out of its place by concentration and expansion. An enormous weight might thus be elevated, which, in its descent, could be made to supply power for mechanical work; but here comes in the practical difficulty. It will have taken days to have thus stored up the force, which, though it might be enormous, would be so concentrated that, to apply it, great multiplication of its motion would be necessary. This would lead to complication of parts, and loss from friction. The writer goes on to say, that the question how to transmit and to transport the power generated by the constant deposition of water by the sun upon the summits of natural inclined planes, is the question to which the age demands an answer.

NEW COAST RANGE AND INTERIOR ROAD. Capt. William Moore and party, who were sent by the Board of Supervisors of Los Angeles County, to ascertain the practicability of a route via Tejunga Cañon, to Soledad and the country on the other side of the Coast Range of mountains,—Mohave river and the copper mining country,—returned to Los Angeles on Tuesday, Oct. 6th. He reports that a good road could be made, with an easy grade, to Soledad Pass, and estimates the expense of making the road at $30,000. The road would open up a splendid timbered country, where any amount of timber could be obtained. Another advantage is that it is thirty miles nearer than the old one, to the mining and farming regions of the interior, the residents of which obtain their supplies from Los Angeles, and it will be free from the danger of floods in winter.

MINERS WANTED IN MISSOURI.—A mining broker, who recently took a tour through the mining fields of South Missouri, says: "Missouri wants 50,000 miners." The present number of lead miners in Missouri is about 800. This includes all the mining done except quarrying the ore from the iron mountains, and a few adventurers exploring for the finer metals. There are about 1,500 miners in the upper lead field and $1,500,000 worth of lead sold in 1867, being $1,000 to each lead miner.

There are three copper fields in Missouri. These extend through Franklin, Crawford, Dent, Shannon, Wayne, Madison and Iron counties, and include 500,000 acres of copper land.

SETTLING UP.—The Tuolumne City *News* is informed by parties from the west side of the San Joaquin river, that over fifty houses have been erected between Graysonville and the southern borders of the county line, within the past three weeks. Most of the settlers have brought with them their families, household goods, and farming implements, with the view of making permanent homes.

Mechanical.

Bramah, Maudslay, Clements, Nasmyth, Whitworth.

These five names, in their order, serve to point out as many steps in the progressive improvement of accurate machinery towards its present state of exact perfection. An article in *Cassell's Magazine* has the following notice of the first named: It is said that the first person who invented labor-saving machines was Bramah, the maker of the patent lock. He found it necessary to give the greatest exactness to every part of the ward and key. This he found it difficult to do without employing the very best workmen; and their charges were so exorbitant that his invention was in a fair way of dropping out of use. In this dilemma he was forced to turn his attention to the introduction of machinery. The workshop in which the many clever contrivances to perform his work with speed were invented, may be said to have been the training-school for the early machinists whose labors have within the present century built up the mechanical greatness of England. Accuracy of machine-work before his day was utterly unknown. Watt had the greatest difficulty in getting his first model of the steam engine constructed with sufficient truth to work; its cylinder was not bored, but hammered—and consequently was so imperfect that it leaked in every direction; and, when his "old white-iron man" died, he despaired of obtaining another skilled man. Even when he had obtained the trained workmen of the Soho Foundry, they found a difficulty at first in constructing working-engines after his design. The accuracy and quality of the best workmen of the day may be gauged by what he says of the working of his steam engine: "The velocity, violence, magnitude, and horrible noise of the engine give universal satisfaction to all beholders—believers or not." What a contrast this to the smooth, irresistible, noiseless action of a steam engine of the present day, constructed with mathematical accuracy and perfect finish!

Maudslay was the inventor of the famous fixed slide-rest. He was a journeyman who learnt his trade with Bramah. Before its invention, the turning-latbe depended for its accuracy upon the steadiness of the muscles of the workmen. If at any moment, in turning a cylinder, for instance, he leaned heavier upon the tool than at another, the whole work had to be gone over again. By simply fixing the turning tool, however, this source of error was entirely obviated, and mathematical accuracy obtained.

Clements also learned his trade in the school of Bramah. He invented the planing machine; without which no perfect plane can be made. "The value of such a machine is incalculable. Indeed, upon the truth of the plane depends the whole value of modern machinery. Of old by chipping and filing, an attempt to approach the plane was made, but of course perfect accuracy was out of the question." Clements invented the steam whistle, also.

Nasmyth was a pupil of Maudslay. But for his steam hammer there would have been no iron-clads, nor any of the monster cannon now built upon the coil system.

Joseph Whitworth is the last and best known of those who issued from the establishment of Maudslay and Field. His "Jim Crow" planer which reverses itself, cutting both backwards and forwards, his rifled gun, and his machine for detecting variations the one-millionth part of an inch,—are fit results of the training which he underwent in an establishment with such a history.

It is but little more than half a century since the hand was all we had to depend upon in the world of mechanics. "If the reader wishes to measure the difference between the old work and the machine work of the present day, he has only to look down at the splendid specimen of Penn's marine engine on board the Warrior iron-clad. The perfection of the workmanship in this engine may be estimated by the fact that, when its five thousand pieces were assembled together for the first time, such was the mathematical accuracy of their fit that as soon as steam was got up, it began to move with the utmost smoothness. Let the reader compare this splendid piece of work with the old Newcomen engine in the South Kensington Museum, and he will at once see the ages of mechanical genius we have traversed since Watt took the latter in hand, and by patient thought built up out of it the present steam engine."

Ericsson's Solar Engine.—C. H. Delamater writes to the *Scientific American* that he has recently witnessed the operation of one of Capt. Ericsson's solar engines. It is "to be actuated by atmospheric air heated by the direct intervention of concentrated solar heat." The working piston of the model makes upward of 300 strokes per minute. He says: "The simplicity and moderate cost of the means devised to concentrate the solar heat are such that no practical difficulties present themselves to prevent the construction of solar engines of any desirable power. Much might be expected from the versatility of the constructor and his extraordinary mechanical resource; yet, the facility with which the radiant heat of the sun may be collected and concentrated from acres of surface, by the means contrived, will alike surprise and interest the mechanical and commercial community." The writer also translates a portion of a paper upon the subject read last spring by Capt. E. before the Philosophical Faculty of the Swedish University of Lund. He does not describe the means by which he concentrates the solar heat; but says that his experiments have shown that the concentration on 100 square feet of surface is more than enough to develop one horse-power. He states also that he has constructed three engines,—one of which is actuated by steam, the other two by air; the heat in both cases being solar heat.

The writer concludes by asserting that such progress is being made, that before the close of the present season, bread will be prepared from flour ground by the power of one of these engines.

Utilization of Waste Heat.—Mr. J. Jones, F. G. S., in a paper read before the British Association at Norwich, describes as follows the Newport furnace now in use in Middlesbro, England: "A chamber is built in the ordinary chimney stack, and in this are placed two cast-iron upright pipes, with a partition reaching nearly to the top of each. The waste gases from the furnace are diverted into the chamber by means of a damper, and raise the temperature of the iron pipes to a high degree. Through these pipes the air required for combustion of the fuel is drawn by means of a steam jet; the mixed air and steam being conveyed to the furnace bridge, and delivered there by a series of tuyeres; also a portion of the air is sent in lower down, underneath the bars of the grate, the ash-pit being closed so that no air can reach the furnace except that which has been heated to a temperature of about 500 degrees by the waste gases. By this means a regenerative action is set up, and, it is found in practice, that the combustion of the fuel is nearly complete, the only smoke produced being at the time when heavy firing is going on. The actual results arrived at by the use of these appliances, show the saving of from twenty-five to thirty per cent. of fuel as compared with the operation of the furnaces of ordinary construction. In the working of several of these furnaces with grey forge iron, six heats per day, the quantity of coal used in producing a ton of puddled iron, has been reduced to 16 cwt., and less; ordinary furnaces, working under similar conditions, using from 22 to 23 cwt. to produce similar results. In proportion as refined iron or lower qualities of pig iron are introduced, the proportion of fuel required decreases considerably."

Scientific Miscellany.

Hæmatoidin.—Holm has given the results of his experiments upon this substance. The source whence he obtained it was the *corpora lutea* from the ovary of the cow. These were rubbed to a fine pulp with pounded glass; this pulp was then placed in a flask with chloroform, and allowed to stand for several days, being frequently agitated. Upon filtration, a deep gold-yellow solution was obtained, which on spontaneous evaporation, left a semi-fluid yellowish-red fatty mass. The fat was evidently a solvent of the hæmatoidin, since it was not until after some days that crystallization began. As it proceeded, the fat gave up its coloring matter to the crystal, leaving finally single and nearly colorless fat drops, each of which contained a small but very beautifully defined hæmatoidin crystal.

If the formation of these crystals be watched under the microscope with a power of 150 diameters, they will first be seen as acute three-sided tables, one of the sides being frequently curved. Generally, two of these triangular crystals unite by their bases, thus giving the rhombic table, so characteristic of hæmatoidin. Sometimes there is an indentation at the obtuse angle of the rhomb, into which other pairs of twins may grow, producing four pointed stars. And these, by the filling in of their re-entering angles, pass into square tables, which increase in thickness and resemble cubes. The obtuse angle of the rhomb, too, is often rounded.

Hæmatoidin is one of the most beautiful substances known to organic chemistry, resembling murexid very closely. By reflected light, perfect crystals show a magnificent cantharides green color, and a metallic luster; by transmitted light they appear red. If not too thick, the crystals, as viewed under the microscope, seem to be a pure magenta red; and a number of crystals irregularly aggregated together show a rich blue or violet tint.

Hæmatoidin is very readily soluble in chloroform, giving a gold-yellow solution; and in carbonic disulphide with a flame-red color, or orange if greatly diluted. Less soluble in absolute ether, not at all in absolute alcohol and water, nor in ammonia, sodic hydrate, dilute mineral acids (non-oxidizing) or dilute acetic acid.

Dr. George Barker gives a notice of these experiments in *Silliman's Journal* for September.

Artificial Carbon Points.—Mr. F. Carre has made pencils of artificial coal, the illuminating power of which, by the aid of electricity, has been found much superior to that obtained from the coal supplied from the glass works. To make this substitute he takes various kinds of sea-coal and charcoal reduced to impalpable powder, and then washed in acids; they are next ground with fine oils mixed with resins; lastly, subjected to a powerful pressure, strongly agglomerating them into prisms or cylinders, which are subsequently calcined in close vessels at a white heat. By addition of iron or antimony the electric power is considerably increased.

Kansas Fossil Reptile.—At a recent meeting of the Philadelphia Academy of Sciences, Prof. E. D. Cope exhibited several fragments of a large Enaliosaur found at Fort Wallace, Kansas. About thirty-two feet of the vertebral column of this specimen has been recovered, besides several ribs, the greater part of the pelvis, and two long bones. The length of the animal is estimated at thirty-eight feet. It was a marine saurian, allied to the Plesiosaurus, and of the Cretaceous Age.

The Eclipse.—It is announced by telegraph that the German expedition to Aden, Arabia, is bringing home six photographic views of the recent total eclipse of the sun. Other expeditions which have been heard from, report spectroscopic observations of the most remarkable character.

Another New Planet.—It is announced that Dr. C. H. F. Peters discovered a new planet on August 24th, while at the Observatory of Hamilton College, Clinton, New York. It is in the constellation Pisces, and is now equal to a star of the eleventh magnitude.

Prof. Tyndall on Materialism.—In his address before the British Association in August, Prof. Tyndall made use of the following language: "Although I think that the materialist will be able finally to maintain the position that thought, as exercised by us, has its correlative in the physics of the brain, I do not think he is entitled to say that his molecular groupings and his molecular motions explain everything. In reality they explain nothing. The utmost he can affirm is the association of two classes of phenomena of whose real bond of union he is in absolute ignorance. The problem of the connection of body and soul is as insolvable in its modern form as it was in the pre-scientific ages. If you ask him whence is this "matter" of which we have been discoursing, who or what divided it into molecules, who or what impressed upon them the necessity of running into organic forms, he has no answer. Science is mute in reply to these questions. Perhaps the mystery may resolve itself into knowledge at some future day. The process of things upon this earth has been one of amelioration. It is a long way from the Iguanodon and his contemporaries to the president and members of the British Association. And whether we regard the improvement from the scientific or from the theological point of view, as the result of progressive development, or the result of successive exhibitions of creative energy, neither view entitles us to assume that man's present faculties end the series—that the process of amelioration stops at him. A time may therefore come when this ultra-scientific region by which we are now enfolded may offer itself to terrestrial, if not to human investigation. Two-thirds of the rays emitted by the sun fail to arouse in the eye the sense of vision. The rays exist, but the visual organ requisite for their translation into light does not exist. And so from this region of darkness and mystery which surrounds us, rays may now be darting which require but the development of the proper intellectual organs to translate them into knowledge, as far surpassing ours, as ours does that of the wallowing reptiles which once held possession of this planet."

The Whale's Food—Color of the Arctic Sea.—Mr. Brown read a paper before the Botanical Society of Edinburgh, giving the results of his researches in the Arctic Seas from 1860 to 1867. He expressed the opinion that the deep green color of certain portions of those seas, described by Hudson and Scoreshy, is due to immense multitudes of minute silicious diatomaceæ which furnish the entire subsistence of the *Balæna mysticetus*, one of the largest of the whales. Thus, an animal which, full-grown weighs about one hundred tons, being in fact "the most gigantic of living animals, is dependent for its existence on a being so small that it takes hundreds, massed together, to be visible to the naked eye."

A New Alkaloid.—M. Rosentiehl has discovered a new alkaloid, isomeric with toluidine, a substance contained in aniline of the shops, and which crystallizes readily. There is, however, another toluidine which is nearly liquid, and yields, with arsenic acid, a red coloring matter, analogous to fuchsine. It boils at 190 degrees Centigrade, and if cooled to freezing point, a single drop of water will suffice to determine the solidification of a large portion of it. This proves to be the common sort; but the remaining liquid still possesses the properties of the other kind, though it yields a smaller proportion of the new red coloring matter. The discoverer proposes calling it provisionally pseudo-toluidine.

The Dana Natural History Society.—The object of this society is "to awaken and extend among the people generally, *and especially among the women* of our country, a greater love for the study of nature." The first chapter was organized about a year ago, in Ripley Female College, at Poultney, Vermont. Since that time, eighteen additional chapters have been organized in different parts of the country.

A new Scientific Association.—An organization similar to the British Social Science Association, is projected in our Western States. A call for a meeting at Chicago on November 10th, has been signed by a large number of professional men and others. It will be called the Western Social Science Association.

Work at the Foundries.

Though the tossing about of some hundreds of tons of pig-iron, and of labyriuths of heavy iron machinery, would be expected to produce some very notable havoc, it is quite surprising to witness so little evidence of Wednesday's earthquake as will meet the eye of the visitor who mny have business at the foundries. Some of the foundries, indeed, have suffered no damage whatever; while others located nlong the old water line have been rent in twain from top to bottom, by a crack measuring on the ground six inches in width;— notwithstanding which the work goes "bravely on."

THE UNION FOUNDRY.

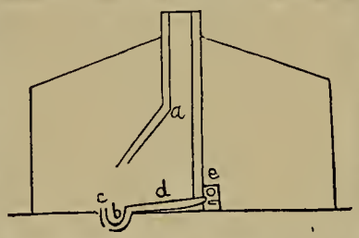
Booth & Co. are engaged on a large pump job for the Hayward mine, in Amador County; three sets of very large hoisting wheels for the Yellow Jacket, Nevada; a very large and fine steam engine of 150 horse-power, for the Star Spangled Banner mine, Nevada City, under the direction of Mr. Wlliam L. Tisdale, Superintendent; a large saw-mill engine for Port Orford, of 18-inch cylinder and 20-inch stroke; n large qunntity of miscellaneous articles, such as shnfting, pulleys, etc., for planing mills and the like; a lot of cnr wheels and nxles for the Central Pacific Railroad—800 wheels and 400 axles being the last joh—this foundry being engaged on most of the work which is done for the Central Pacific in this city. They are nlso building quite a number of the patent cut-off engines of Scott & Eckart, which took the premium at the late Mechanics' Institute Fair. All the work for the city street railroads is done here, which amounts to considernble in detail; also the work of the Black Diamond and Pittsburg Railroad, and of the Somerville and Monte Diablo, and the San José Rnilroads. The engines constructed hy Mr. Scott for the steep grades leading up to the Monte Diablo coal mines are said to he doing their work very satisfactorily.

A Coffin & Standish steam plow, of 16 feet width, is being huilt here for a Mr. Miller, of San Francisco, and is intended to he used hy a company orgnnized on the basis of cultivatiug land with improved machinery, for the increased profits over a certain figure that will be returned to them.

The apparatus for the Nolf & Pioche electricity reduction process, is heing made here.

AT THE GOLDEN STATE FOUNDRY,

Palmer, Knox & Co. nre engaged in making some of Frauk Cone's Revolving Spaders, one of which was exhibited at the late State Agricultural Fair. The one in hand is for a party in El Dorndo County. The Spader is not a steam plow; it is drawn by nbout eight horses, and cuts up a swath of eight feet. It costs $500—not more than n gang plow, while it is claimed that there is "no wear out to it." In principle it is nhout the snme as a roller would be with spades stuck nll over its surfnce. As the roller is put in motion the spades are pressed into the soil, and then break it up as they come out.



In mining machinery there is little on hand at present, except the turning out of a numher of Knox's pans—for the Prairie Diggings, Oregon, and for the Banner mine, Nevnda City, etc.;—nnd the usual qunntity of repairs. White iron shoes for stamp mills, are made in lnrge quautities, to order, being very hard and superior.

Some work is being done for the Submergod Pump Co., of which Mr. Mudge is the agent, on Cnlifornia street, the order being for pieces and connections calculated to enable them to work in deep mines. The iron-work for Gnston's Excelsior Grain-sower is manufactured to fill a goodly number of orders from all over the country. It is a broadcast sower, and is generally put togother by the wagon-makers who order them. Printing presses for Faulkner & Co, are being made, one after another. Enlargements have been found necessary, and have heen made, in the blacksmithing department.

Lead Mining and Smelting in Japan.

From ignornnce of the use of powder in blasting, the menns possessed hy the Japanese for attacking rock were—till the application of powder in mining introduced by us—confined to the use of pointed instruments, a miner's pick with oue point, similar to our own, a hammer and gad, with handle, like the German eizen, completing the outfit.

The furnace in which the ore is smelted is a cavity in the grounnd, lined with charcoal powder kneaded with puddled clay, forming a hemispherical crucible (*b*) about fourteen feet broad and ten deep, with an under-drainage. In front is au earthen shield (*c*) to reflect the force of the blast which enters through n clay nozzle (*d*) from the box bellows (*c*). The greater part of the smoke, etc., passes off through a large chimney (*a*). The crucible is lined with charcoal, and wheu fully dried, about

eighty pounds of ore is added and covered with charcoal. When hnlf melted, thirty per cent. of pig-iron, in lumps of about an inch cube, is added. As soou as about one-half of the galena is freed from its sulphur, the whole is stirred. After about two hours the coals are withdrawn, the blast stopped, and water is thrown on the bath to cool the first layer of matte. This is repented six or seven times till the surface of the lead is free, when it is cnst in bars, the mntte heing thrown nway.

The greatest production of these mines was in 1860, when, during three months, they averaged 600 pounds daily; at the time of my visit it wns ahout eighty pounds.

The daily running expenses of prodnction for this small result of eighty pounds, was as follows:

30 miners, averaging 6 cents	$1 80
30 coolies at 8 cents	2 40
7 overseers at 5 cents	35
1 carpenter	8
26 ore dressers, averaging 3 cents	78
2 stamp tenders, 4 cents each	8
1 smelter	8
2 smelter's assistants, 4 cents each	8
200 lbs charcoal	17
30 lbs. of inferior pig iron	16
Total	$5 98

The miners working in ore are paid according to the weight and quality of the ore extracted, receiviug one cent for every ten kans, or eighty pounds of best rough ore, and one-half cent for the same quautity of inferior.

When not working on ore, they are paid by the running foot on the gallery, and the hardness of the rock, receiving per running shak or foot, sixty cents for the hardest rock, and fourteen for the softest, the average at these mines being thirty ceuts. One man can advance a gallery one foot in the hnrdest rock of these mines, in five days.

The timhering of the levels costs ten cents per runniug foot, the wood growing in the viciuity.—*Raphael Pumpelly's Account of the Ichinowatari Mines, Smithsonian Contributions*, 1866.

THE GRAND LODGE OF FREEMASONS for California, brought into our midst last week n good representation of our best citizens from every part of the State. The election for Grand Officers resulted as follows: Charles Marsh, of Nevada, Grnnd Master; Leonidns E. Pratt, formerly of Sierra, Deputy Grand Muster; T. G. Cockrill, of San Francisco, Senior Grand Warden; F. Barss, of El Dorado, Juuior Grand Warden; Jas. E. Laidley, of San Fraucisco, (reëlected), Grand Treasurer; Alexander G. Ahell, of San Fraucisco (reëlected), Grand Secretary.

THE ship Asa Eldridge is discharging iron, for the Gilroy Railroad, at Cowoll's wharf.

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can bo represented by one. It is not only immediately necessary in preparing the papers, but tbe law demands that the inventor shall, in all cases, furnish a model, which mnst not exceed twelve inches in any of its dimensions. A medel of less size will answer when more convenient. It should be nently made, and of hard wood or metal, or both, varnished or painted; the namo of the inventor should be eograved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should he sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses nnd send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteon dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and nlso the remittance, stating the name nnd address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the applicntion proceeded with as fast as possible. When tho documents are ready we send them to the inventor by mnil, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for prepnring the case is then due and will he enlled for. The cnse will then bo presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The lnw stntes that every patent shall be dated as of a day not inter than six months after the time at which it wns passed nnd allowed, and notice thereof sent to the applicnnt or his agent. And if the finnl fee for such patent be not pnid within the said six months, the patent shnll be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their npplication in the Patent Office, when it is possible for us to do so We do not require the personal attendance of the inventor, unless it is one of great complication, ns the business enn be well done by correspondence.

When the invention consists of n new article of manufacture, n medicine, or a new composition, samples of the separnte ingredients, sufficient to make the experiment, and also of the mnnufactured article itself must be furnished, with full description of the entire prepnration.

The nverage time required to procure a pntent, when the case is conducted nt our ngency, is ten weeks. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Candid Reasoning.

A gentleman eminent for his ability in all points pertaining to specifications, gives inventors the following sound advice:

To properly prepare a specification may seem a very simple and easy tnsk, hut such is not the case. It requires a knowledge of the arts, of science and scientific terms, and their proper use—of mechanics and the principles that govern their nction—of law, nnd of the grammatical and legal force and construction of languago, which is possessed by but very few persons.

Lawyers seldom possess the mechnnical knowledge, while mechanics still more generally lack the legal knowledge necessary to enable thom to properly preparo a case for examination.

It requires such a *combination* of legal and mechanical knowledge, together with a special knowledge of the principles nnd rqles that govern the action of the office, that no person is really competent to undertake the business but those who *have made it a study, or had experience at it.* In view of these facts I unhesitatingly advise every person who has an invention worth patenting to get some responsiblo and competeut agent to attend to it for him.

No person scarcely would think of entering upon a suit at law without employing a lawyer to attend to it, and make out his papers for him; and if a sensible man would not do that, much less would he nttempt to prepare an application for a patent without knowing anything nbout tho business.

I nm awaro that persons frequently attempt it, but I am also aware that *many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given when once rejected.*

Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their invention, nnd is therefore useless. It is for this reason that many applicants are compelled to reissne their patents at as great, and often greater expense, than the obtaining of the original.

Hence I repeat, every person having an invention worth patenting should employ a competent nnd responsible agent—I say *competent and responsible*, for, unfortunately, there are many who are neither competent nor responsible.

If worth filing nt all, these cases should be prepared with very great care and caution.

One intentor on this Coast, who had filed n caveat by an attorney, was, sometime afterwnrd, surprised to find that his invention, which was a very important one, hnd been patented and was being brought out by an eastern company with a capital of more than a million of dollnrs. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his net having complied with the law in that case as made and provided.

Inventors will oftimes find it very important to take advantage of the enveat system—the expense under the law being comparatively small.

To enable us to prepnre caveat papers, we only require a sketch and description of the invention; no model being necessnry.

If an inventor publicly uses and sells his invention, prior to mnking application for a patent, he cannot, afterward, prevent others from doing the same thing; nnd should nny party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented, or "Patent applied for."

Self-Evident Facts.

Having had lnrge experience, and gratifying success with tho great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, nnd from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself n SPECIALITY of legal jurisprudence; or, as Mr. Phillips, an eminent patent lawyer, justly remnrked: "The metaphysics of the law."

In early days but little prepnration was oeeded, or but ordioary skill required to obtain a pateat; but now, by reason of the multiplicity of inventions, nnd the numerous Acts of Congress, fennd necessary to protect the inventor while the patent lasts, nnd to do justice to the people after it expires, the utmost eare and skill are requisite in managing eases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The generul practice of the Patent Office regnrding the examination or issue of Letters Patent for inventions has not been materially ehsnged for many years, yet there hnve been amendments added to the laws of 1861, 1863, nnd 1866, and which it is necessnry for nll parties managing nn application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* nnd *experience.* As ngents with such qualifications, we solicit honest patronage.

Re-Issues.

When, through "inadvertence, nccident, or mistnke," nn *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can be cured by a *re-issue.* In order to obtain this, tho inventor, or the holders of the patent, must surrender the pntent, and file an nmended specification and drawings, and a statement specifying the ground for asking for a re-issuo. Re-issues are generally npplied for after it has been found thnt the patent could not withstand litigation. It is, therefore, especinlly desirnble that the new Specification and Claims should be prepnred with great care and skill. Terms liberal in these eases.

Dangers of Delay.

Situnted so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Vnluable patents mny be lost by the extra time consumed in transmitting specifientions from Eastern ageneies back to this coast for the signature of tho inventor, or by reason of return for amendment when nddressed directly by the inventor to the Government.

Illustrate your Innentiovs.

Too many ingenious inventors lose the value of their genius and labor by oot bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-clnss engraving.

With a cheap representntion we will have nothing to do, as it would be calculated to injure both tho inventor and ourselves.

We also take especial pains in furnishiag engraviogs and electrotypes of snperior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistanco, in gettiug up tbeir circulars, advertisements, etc.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,
414 Clay Street, below Sansome, San Francisco.

SEPTEMBER, 1868.

ATTENTION.—Virginia City, Aug. 9th, 1868—Dewey & Co., San Francisco.—Gents:

The Patent, enclosing your favor with Inventor's certificate, etc., came duly to hand, and for which please accept my grateful acknowledgements.

I am pleased to learn that the business of your agency for Patents, etc., is rapidly increasing. This is as it should be. Your promptness, fidelity and skill, as Patent Agents, entitle you to public confidence and patronage.

I can see no good reason why Inventors on the Pacific Coast should employ agents in New York and other Eastern cities to transact their business at the Patent Office, when we have among us those equally qualified by long study and large experience.

Yours truly, J. A. C.

Weekly Stock Circular.

y Associated Brokers of the S F. Stock and Exchange Board.

San Francisco, October 24, 1868.

Financial.

The Commercial Herald, of the 22d inst., has the following relative to our local money market:

The San Francisco money market is one of the steadiest n the world. The quotations for eighteen months have undergone little change. Coin is abundant, and can be obained in bank at the frozen rates of 1@1½ per cent per month. The cash employed to move our crops is returning gain, increasing deposits and keeping the market easy. utlinn is inactive at present, and gold bars have changed o 869 from 870, at date of our last issue. Silver bars remain nchanged, ruling from par to ¼ per cent. premium; currency bills have declined 1 per cent, being a fall of 3 per cent. since October 6th, and are now 35@25½ per cent. premium on gold; sight drafts, payable in coin, obtain 1 per ent. premium; telegraphic transfers, 1½ per cent. premium; sterling exchange, 48¾@49d; commercial do, 49½d; Mexican dollars, 1½@5 per cent., being a decline of 1½ per ent. since October 6th. Large capitalists readily advance oney on grain deposited in their warehouses, at 1 per cent. er month, while outside lenders demand 1½ per cent. ew York telegrams quote Gold at 137¼. In this city Legal enders are selling at 72@72½c.

There are very strong indications that the Central Pacific ailroad Company has secured the refusal of the lands and uildings belonging to the Pacific Mail Steamship Company t Benicia. That property now consists of thirty-two acres ying along the water, with a frontage of sixteen hundred neal feet. Considerable activity has been shown by certain parties in purchasing adjacent lands, and much secrecy as been observed in these transactions. It is probably the ntention to establish at that spot the machine and railroad shops for the railroad, and also to make it a great *warehouse* for grain. The Central company has likewise ought a controlling interest in the Oakland Railroad and Ferry Company, and having taken the Washoe and the Oakland ntil the route, is employing them for the transportation f rails and other materials to Sacramento. At the same ime the company is building a large and commodious wharf t the foot of Second street, probably with the intention of rossing freight for Oakland and back from that point, while the passenger boats will continue to cross, as before, rom the foot of Pacific street. We note, furthermore, that he California Steam Navigation Company has concluded to ass dividends for the present in order to build two fast, rst-class boats to run between San Francisco and Sacramento to compete with the railroad from Vallejo to Sacramento, and the branch road to Benicia, which has been surveyed, and another boat to be placed on the Stockton route, s a night boat. The opposition now existing on this route akes passengers to Benicia for 50 cents, while the regular ine demands $2. The inland trade and passenger movements of this State are becoming so large that they will ive ample employment to all at reasonable rates; but if war to the knife, and the knife to the hilt," is to be the rder of the day, it is probable that all partice will become omewhat crippled in the engagement. Whatever tends to nprove the condition of Benicia, Vallejo, Oakland, and ther neighboring towns, will materially add to the prosperity of this city, the center of capital, manufactures and ommerce, and the natural maritime mistress of the Pacific. In proof of the rapidity with which our commerce is xtending, we cite the assertion of one who is in a position o know, that in less than one year the P. M. S. S. Company vill be running weekly steamers to Japan and China.

City Stocks.

The transactions in miscellaneous stocks were somewhat more extensive than the previous week, and st ss ull figures as previously reported. San Francisco Gas tock realized $77 50 per share; Spring Valley Water, 66 50; Oakland Railroad, $60, and Union Insursnce Co. 92@92 50. Lsrge sales of Legal Tenders were made uring the week, rising to 73@73½ cents.

The Mutual Savings Building and Loan Society recently filed its certificate of incorporation. The object f the incorporation is the aggregation and preservation f funds for their mutual benefit. The Trustees are H. oseKrans, J. N. Russ, William B. Lake, Howard Chapman, Charles Hansen, George W. Stevens and J. W. Winger.

The receipts of the local insurance companies during the onth of September and previously this year, according to is returns in the hands of the Internal Revenue Collector f this district, have been as follows:

	September	*Previously this year.*	*Total.*
acific	$35,607	$340,439	$376,046
nion	36,490	276,098	312,526

eoples'	8,350	51,812	60,162
Totals	$220,241	$1,803,190	$2,063,431
Same time in 1867	233,210	1,494,972	1,730,182
Increase in 1868	$25,031	$308,218	$333,249

The returns were made upon a legal tender basis, the ate—72 cents for January, 71 cents for February, 72 cents r March, April, May and June, 70 cents for July and August, and 72 cents for September—being fixed every month y the Assessor of the district.

The National and San Francisco have disincorporated id their outstanding risks have been transferred to the ondon and Liverpool and Globe Insurance Company. The an Francisco dishursed a dividend of 2½ per cent. per nnath, or $7 50 per share, for the quarter ending with September 30th.

The above statement shows an increase of $18,805 as ainst the receipts in August. The receipts of the several ompanies in September, as compared with August, show e following difference:

	Increase.	*Decrease.*
acific	.....	$307
nion	.....	8,094
reman's Fund	$5,059	.....
uilders'	711	.....
alifornia	14,114	.....
erchants' Mutual Marino	1,388	.....
ecidental	.....	377
ome Mutual	1,219	.....
eople's	2,052	.....

The receipts of the city railroads for the month of September and previously this year, have been as follows:

	September.	*Previously this year.*	*Total.*
onibue	$27,142	$203,651	$230,793
orth Beach & Mission	24,062	180,808	204,870
entral	16,223	113,579	129,802
ont Street, Misaion & Ocean	9,586	67,595	76,961
arket Street	11,737	72,836	84,573
otrero and Bay View	2,636	16,319	18,955
Totals	$91,186	$654,788	$745,974
Same time in 1867	78,488	529,372	607,860
Increase in 1868	$12,698	$125,416	$138,114

Showing an aggregate decrease of $5,459 in September as against the receipts of August. The receipts of September as compared with August show the following difference:

	Increase.	*Decrease.*
Omnibus	.....	$764
North Beach and Mission	.....	2,962
Central	.....	1,101
Front Street, Mission and Ocean	.....	458
Market Street	.....	261
Potrero and Bay View	.....	314

The receipts of the San Francisco and San Jose Railroad were $39,823 in May; $51,425 in June; $52,502 in July, $52,953 in August, and $53,148 in September. The Mission Bridge Co. report receipts for August to be $1,201, and for September $1,038.

Mining Share Market.

The mining share market during the past week has shown considerable activity, notwithstanding the general derangement of business consequent upon the severe shock of earthquake experienced on the morning of the 21st instant. The Board adjourned for that day, and at its sessions the following day stocks generally ruled higher. At the close this market is very firm, and leading descriptions of stock show a marked advance.

The White Pine mining district in Nevada is creating considerable excitement. The rock in appearance is reported to equal that taken from the Mexican mine, on the Comstock, in 1860. As we are informed that there are thousands of tons of the same kind of ore in White Pine, it is believed that next summer that district will be the most flourishing place in Nevada. A number of mills in the Reese River district will be removed to White Pine this winter. The discovery of the White Pine mines is another indication that mining in Nevada is only in its infancy, and that its future as a State continues to look bright.

Alpha—advanced from $41 50 to $47, and closed at $46. On the 21st inst., the south drift on the 910 level was in nineteen feet, and it is said there are some good spots of ore in the "face," average assays showing $41 to the ton. The north drift is in twenty-one feet with no change. They intend to make a cross-cut west from the south drift so soon as they are some fifteen feet further south. At present the west side of the drift looks the most favorable.

Overman—sold quite freely, improving from $75 to $84, and at the close selling at $81. On the 15th, $3,413 in bullion was sent forward, and on the 19th, $3,421. They are extracting an increased amount of ore. On the 18th inst., they took out 110 tons. The mine is reported to look well, and the ore is said to average much higher the present month.

Chollar-Potosi—opened at $141, advanced to $146 50, and closed at $146. During the week ending October 16th, 1,086 tons of ore were extracted, all of it being taken from the Blue Wing ground. This section is said to be more promising, the ore averaging better, and the quantity exposed is reported to be larger than at any time since work was commenced on this stope. The north drift on the 1,100 level, new mine, is in very hard rock. On the 20th instant, 139½ tons of ore were sent to five different mills.

Imperial—commands better prices, having advanced from $106 to $115, and closed at $114. On the 21st inst., the Imperial-Empire shaft was 117 feet in depth below the 900 level, the rock being softer, enabling them to sink two feet a day. The main drift of the 900 level is in clay, and it will require three or four days, it is thought, to run through it. The drift ont of winze 50 feet below the 700 level of the Alta mine is now in 36 feet, showing some threads of ore. Both bodies of ore on the 600 level and that on the 400 level continue to produce the usual amount of ore. They hoist at present about 150 tons per day. The receipts of bullion so far for October account aggregate $19,196.

Crown Point—sold early in the week at $41 50@49, then at $44@46, closing at $48. A telegram received on the 22d, reads—"No change whatever in the mine. The 900 level is opened up so that they can run the mill without interruption."

Kentuck—changed hands to a moderate extent within a range of $273@280, and closed at $280. The receipts of bullion to date for October account foot up $27,678.....

Ophir was in the market at $19. On the 21st inst., the shaft had attained a depth of 600 feet.....Savage was again largely dealt in at a decline, receding from $91 to $82 60, then selling at $86 60, and closing at $89.

Amador—sold at $230. On the 16th inst., the Badger shaft was 40 feet in depth below the lower level, the vein remaining same width as previously reported—three feet—and looking a little better. A dividend of $5 per share is payable since the 20th....Eureka (Cal.) shows a bullion yield of $474,134 for the fiscal year ending September 30th, 1868, being the product of 16,087 tons of ore, of which 143 tons were sulphurets, showing an average yield of $29 47 per ton. A dividend of $5 per share is payable since the 22d instant. Out of this $270,000 were disbursed in dividends.

Gold Hill Quartz—dispatched $1,950 of bullion on the 19th inst....United States levied an assessment of $1 per share on the 15th inst....Julia levied an assessment of $1 60 per share on the 22d inst.

The sales in the San Francisco Stock and Exchange Board during the past week heve been as follows: Open sessions, $412,697; Regular sessions, $1,304,556—total, $1,717,523.

With dyspeptics everything is wrong. Food does not digest; sleep does not refresh; wine does not cheer; smiles do not gladden; music does not charm, nor can any other joy enter the breast of the miserable dyspeptic. You must get rid of it or it will become seated and confirmed, and life will be a burden and existence a curse. Plantation Bitters will do away with all this. New life, strength and energy will take possession of you. The damask will again bloom upon your cheek, and the luster in your eye will again be as bright as in your healthiest, happiest and most joyous days. *

San Francisco Prices of Copper Ores.

San Francisco, Oct. 23, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

Per ton.		*Per ton.*
12 per cent. ore	$16 00	22 per cent. ore $43 66
13 " "	18 62½	23 " " 46 45

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

Until after the political cauldron has ceased to boil, and our country cotemporaries have recovered their usual good natures, our summary of mining news will necessarily be short.

CALIFORNIA.

Alpine County.

Markleeville *Miner* October 10th: Gamble re-assumes charge of the Morning Star mine on Monday. We learn from him that it is the desire of the Company, and his intention, to push forward the work, and place the mine in shape to supply ore to such reduction works as they may adopt—the same being now under consideration—at as early a day as possible.

Amador County.

Jackson *Ledger* Oct. 17th: Large quantities of machinery for the Casco mill has passed through this place during the week.

Mr. Haley, of San Francisco, principal owner in the Casco mine at Middle Bar and the Union mine at Pine Grove, informs us that he intends to begin work on the latter mine again at an early day.

The work of taking down the machinery formerly used by the Butte Basin Mining Company, has been commenced preparatory to removing it to the Anacouda mine, near Pine Grove.

Mariposa County.

Mail, Oct. 6th: Mariposa county is no doubt the richest in minerals of any county in the State. Although things have looked gloomy for the last year, our latest advices indicate a healthier aspect of affairs. Hite & Co's new mill, in Hite's Cove, is in successful operation; it has just double the capacity of the former mill; it gives employment to twice the number of laborers. It is unnecessary for us to speak of the richness of the mine: suffice it to say that this mine is second to none in the State. John W. Wilcox commenced operations on Monday last, on a recently discovered vein, situated a short distance below the Benton Mills, on the Merced river; he inteuds to erect a mill on the vein before winter. Judging from the prospects, this mine will be a great source of revenue to its owners and to the county. Harbor, Williams, Fine & Co., are busy in erecting a mill on their vein, near Buckingham Mountain, which will be in operation by the first of December. This is also a newly discovered vein. The owners have already several hundred tons of rock on their mill site, which will more than repay for building their mill and prospecting the vein. The Mariposa Co. also show some signs of activity, and if the season is favorable, will have some of their mills in operation by the first of January.

John W. Wilcox and W. W. Ketton, of Bear Valley, have purchased the rich and valuable mine, situated on the Merced river, about one mile below the Benton Mills. The vein was discovered by Lucien Gilman. The interest purchased is 2,000 feet in length, of an average of from one and a half to three feet in width. It is one of the richest, and soon will be one of the most productive mines in Mariposa county. Ample tests of the rock have already been made, showing conclusively that the rock, taking it all as quarried from the mine, will yield $100 per ton. Already a "gang" of men have been set at work upon the mine, quarrying out the rich ore, preparatory to the immediate erection of an 8-stamp mill. The mine is to be named, and hereafter known as the "Maggie Russell."

Gazette, Oct. 16th: It is reported that a rich strike was made near Hornitos a few days ago by a couple of lucky miners. Rumor has it that as much as 50 pounds of gold have been taken from the pocket. It was located on the hill back of Hall's Hotel.

Hite's new quartz mill is in fine working order, is now crushing about 16 tons of rock per day, which, as near as we could learn, is paying handsomely. Everything indicates prosperous times in store for that region.

We learn from a gentleman recently from Buchanan Hollow that Villas & Co., proprietors of the mine at that place, are now working some 50 hands and are shipping about 50 tons of copper per week. The prospect is brightning.

Nevada County.

Transcript, Oct. 14th: The Bed-Rock Tunnel Co. of Bridgeport township, have completed their tunnel to a point under the channel for which they are running. The tunnel is 2,503 feet in length, 300 feet below the bed-rock and 429 ft. below the surface. When the shaft is raised it will give sufficient drainage to a number of excellent mining claims on Johnson's Hill. The ground was prospected in 1860 and the tunnel was commenced in 1862.

Oct. 15th: Wm. Young & Co. have located 1,400 ft. on a quartz ledge on Wolf Creek, one mile east of Grass Valley.

The Savage Co. have located 1,400 ft. at Ray's ranch, Grass Valley township. This location is near Dead Man's Flat, and 1½ miles from the North Star claims.

The East Idaho Co. has located 800 feet adjoining the Grass Valley Consolidated Co.

The Giant ledge has located 1,500 ft. on a ledge located in Grass Valley township: 200 yards from the old Mount George saw-mill on Wolf Creek.

Grass Valley *Union*, Oct. 14th: The Mutual Gold Mining Co. at Eureka, continues to mine and mill their rock at $5 per ton.

The Salathiel quartz mine, above Omega, has suspended operations. Twenty-five or thirty men are employed....When the new mill of the Coe mine is ready to run the working force of the mine will be largely increased.

Oct. 15th: Not a single rich mining strike was to be heard of on the streets yesterday—but yet they are of such frequent occurrence in this district as not to excite unusual comment.

Oct. 15th: There was brought to Findley & Co's Bank yesterday, from the North Star mine, a large piece of vein rock, that was truly a magnificent specimen of mineral richness. The rock was about 70 lbs. in weight and running entirely through it, mixed in beautiful combination, was gold, galena and sulphurets. This specimen attracted unusual attention—although rich quartz is by no means rare in Grass Valley—and experienced miners and quartz men united in the opinion that in real mineral wealth, it was the finest specimen they had ever seen in the district. But the most gratifying fact in connection with it, to the North Star Co., is that it is characteristic of the vein on the seventh or 1,040-ft. level, at a distance 292 east of the shaft, where the workmen have just opened on a portion of the vein that presents the appearance of being equally as rich as this piece. At this point the vein is full four feet in width and extraordinarily rich. This same rich chute was struck in the sixth level last season, but it is only by the opening of the seventh level, 100 ft. lower, that they were apprized of the extent and continued richness of the chute. The rock or ore, as seen in the vein, we are assured, looks extraordinarily rich, more so than anything before seen in the North Star mine, which certainly has been no niggard in producing rich rock from time to time.

We hear of several new quartz prospecting operations that are showing favorably, and giving hope of good results. One of them is a new shaft that has been sunk some 40 ft. in depth on a vein in the vicinity of the Dromedary lead, the rock from which yielded $40 to the ton. Work upon it is still in progress, and the rock keeps up its good appearance.

EXCELSIOR.—Truckee *Tribune*, Oct. 17th: We learn from Mr. William Wilkins, that the Green Emigrant Co. crushed 93 tons of rock at the California mill and cleaned up in the neighborhood of $3,000. They have about 200 tons more of rock to crush, which bears every indication of being equally as good. The Mohawk Co. are running their mill night and day with splendid effect. Business is improving, and everybody is busy.

Plumas Count.

Quincy *National*, Oct. 8th: Kelly, Mosier & Co., on Hungariau Hill, have finished cleaning up for the season, and we learn that they have made a profitable summer's work.

Oct. 15th: The Taylorville correspondent writes: Most of the quartz mills are busy, but things seem rather dead at the Crescent mills.

Sierra County.

Downieville *Messenger*, Oct. 17th: The Gold Bluff Co. have at last struck the ledge in their mine near this place. We are without particulars further than that the rock is very rich. This company have been working several years running a tunnel, and finally stopped work in that direction thinking they had got far enough to cut the ledge if one existed. They then commenced raising a shaft and at a hight of about 100 feet they found the ledge pitching into the hill, proving that they had not run their tunnel far enough.

Siskiyou County.

The Eureka *Union* says: Mining on the bars of Klamath river is said to be paying good, steady, average wages to a large importation of Chinamen, who have lately commenced operations between the mouth of Humbug and Cottonwood.

The miners on the Klamath, below Cottonwood, Siskiyou County, are beginning to get into their claims. Shaft, Smith & Co. have got down, and for three days work last week took out 28 ozs. The prospect in their claim for a large yield is excellent. The Ellises, who sunk down right at the upper edge of Groat's ranch, have struck good pay, and are taking out an ounce a day to the hand.

ARIZONA.

Prescott *Miner*, Sept. 26th: Linn, Shupp and Brook worked, recently, in Walker's district, 60 tons of refuse rock which yielded somewhere in the neighborhood of $30 to the ton.

Jackson & Co. have started work on a three acre reservoir on Lower Lynx Creek. The last run made by the company paid $14 per diem to the man.

Gray & Co. dispatched a lot of provisions to their mill at Big Bug, the other day. We understand that it is the intention of the company to commence operations at an early day.

Prescott *Miner*, Oct 3d: The tunnel in the Chase mine is now in about 180 ft. The rock taken out of it looks well, and is said to be very rich.

Work is progressing finely at the Sterling mine. The shaft has been timbered, and men are now engaged in taking out ore.

We learn from parties just arrived from Black Cañon Creek, Bradshaw district, that the Black Cañon Placer Mining Co. had their ditch nearly finished when the party left, and that in cutting it, they got the biggest kind of prospects. The ditch is half a mile in length, and has taken some hard work to make it. A good deal of blasting had to be done. When the party left, there were five or six sluiceheads of water in the creek. Flower & Bradshaw examined some quartz mines close to the creek, and found them to be rich. They think a great deal of the Valenciana mine.

The Hardyville correspondent writes: "Mr. Hardy, so says his employés, has struck some very rich rock in his mine."

COLORADO.

Georgetown *Miner*, Oct. 1st: The Flora McLain lode, on Sherman Mountain, is now carrying from six to eight inches of mineral at a depth of 47 feet. The crevice is from 30 to 36 inches in width.

An assay recently made of ore from the Norman lode, gave a result of 70 per cent. of pure lead, and 71 ounces of silver per ton.

The yield from 2¼ cords of ore from the Conqueror lode at Empire, crushed at the Knickerhocker mill, was $568.80, currency, at the rate of $250.80 per cord.

From Empire we learn that business of all kinds is looking up, particularly mining. Disbrow & Haskius have got through the cap on the Conqueror lode, and have a 36-inch iron crevice, which with all the ore in the crevice, they are now running in the Knickerhocker mill and obtaining from $200 to $225 per cord. The parties who are putting up new processes in the Peck Co. mill, are progressing as fast as they can obtain materials, and will be ready to run in a few days.

Hnepeden, Wolters & Co. have shipped to H. Amy & Co., New York, during the past week, on their own account, 651 ozs. of silver bullion, .862 fine, coin value $140.40, Magnet lode, 226 ozs., .813 fine, coin value $242 19,———lode, 32 ounces, 873 fine, coin value $36.14. The total amount taken out is $1145.67 coin value.

We were at Prof. Stewart's works on Tuesday last, and found things moving slowly, owing to imperfections in the machinery. He has ont a nice lot of amalgam, and some retort, besides some lead riches for cupellation. The retort is over 900 fine. His machinery will soon be enclosed by a frame building 28 by 44 ft. We saw some very fine ore there from Capt. Light's mines in Daily Dist. Tests made from it show that it will run about $250 in silver to the ton. Some 15 tons of Cliff ore is now undergoing reduction.

Central City *Register* Oct. 1st: A ton of silver ore per day is being taken from the Gilpin County Tunnel below Black Hawk, which is sold for $300 per ton to Prof. Hill.

Miller & Buffington's mill at Black Hawk has shut down for a few days to put in a new flume for their water power. Hays has shut down the New York mill for a few days, to mend breakages. It is expected that 50 stamps will be running in the Consolidated Gregory Co.'s mill by the 1st of November. Twenty-three stamps are now running on Bobtail ores in the Sterling mill.

The Rising Sun lode, on Quartz Hill, owned by McCasskill, Egan, McNair, & Slatery, is yielding 8 cords of ore per week, which yields from 8 to 11 ounces of gold per cord. They have three shafts, one 98 ft., one 43, and the other 30 ft. deep. They are working 8 men. Copper is very abundant in the ore, often occurring in the form of native copper.

We were shown yesterday a certificate of assay from ores of the Minnesota lode, in Russell district. The sample assayed was said to be an average of a 5-foot vein of ore. The product was $32 and some cents in gold, and $12 and some cents silver, making a total of upwards of $44 in coin, per ton.

On the Circassian lode, near the Four Mile House, there are four shafts. The ore vein in the discovery shaft is about 3 ft. wide, in the second shaft it is about 18 inches, in the third about 14 inches, and about two feet wide in the fourth. There are about 400 tons of rich-looking ore on the surface; none of it has ever been assayed or smelted, so that the exact yield is not known—but it looks as if it might be one of the richest silver ores in the region.

The May lode, just below this, is now idle. A few hits of ore found around the shaft house did not seem to be very rich.

The Blue lode, in the same locality, is also idle. On it are two shafts, one 50 and the other 20 ft. deep, showing a large crevice of very rich ore.

IDAHO.

Owyhee *Avalanche*, Oct. 10th: Happening in at Wells, Fargo & Co's office on Tuesday last, we noticed a brick worth a little over $22,000. It was taken from the Ida Elmore mine, and has since been sent to San Francisco by Thos. Cole, Jr.

Last Wednesday, Peck & Porter struck it rich in their mine, the second South Extension of the Oro Fino. One hundred feet from the surface and 25 ft. north of the main shaft a two feet vein of exceedingly rich gold and silver bearing quartz was found. The ore resembles that of the Golden Chariot and Ida Elmore in character and richness. This will not be wondered at when it is known to be nearly on the same range with those mines. Some large pieces which we examined were completely covered over and diffused throughout with gold.

A rich pocket has been struck in the Oro Fino mine.

Another rich strike has been made in the Flint district.

Walla Walla *Statesman*, Oct. 4th: D. M. Drumheller, through from Kootenai in six days, brings the news of the discovery of new and rich mines on a creek distant 25 miles from the old Kootenai diggings. The discovery had created intense excitement, and miners were deserting their claims and streaming into the new diggings.

The discovery was made in the early part of September by a party of three miners who had been out on a general prospecting tour, and were on their return somewhat discouraged with the result of their expedition. On their way out they had noticed indications of gold on the creek already described, and on their return they thought they would give it another examination, which resulted in the discovery of the best mines that have yet been found in the northern country.

The stream on which the gold was found has been named Perry Creek, in honor of one of the discoverers. The creek has been prospected a distance of 12 miles and found to pay well the entire distance. The three men who made the discovery, panned out in five days $225. They had but two pans, and were without conveniences for working to advantage. They took out as much as $13 to the pan, and in one instance, got $18. The gold is coarse and resembles Kootenai dust, with the exception that the color is a shade lighter. It is estimated to be worth from $18 to $19 to the ounce.

Mr. Drumheller visited the mines in person and satisfied himself that they are both rich and extensive. He has with him some $30 to $40 of the dust which he washed out himself. The Gold Commissioner has visited the mines and laid over the claims until the 1st of June.

MONTANA.

Helena *Post*, Oct. 9th: J. C. Ricker cleaned up in his IXL 24-stamp mill, day before yesterday, $6,976.26 in gold, equal to $10,000 in currency. This rock was from the IXL works, on the famous Whitlach-Union lead, and is only a specimen of what Mr. Ricker is doing from week to week.

Miners have been working in Ram's-horn gulch, 17 miles from Virginia City, from the day on which Alder was discovered in 1863. Hitherto their efforts have been unsuccessful. Last year, fair prospects were found near the saw-mill of Holter Bros. During the past season, several parties have been laboring on flumes. Mr. Tierman has finally struck a fine bed of gravel several feet below what has generally been considered the bed-rock. The gulch is nine miles in length, and heads in the same range of

mountains with Biven's, which has already yielded its millions. For the last two days there has been a stampede from the capital.

The Plymouth Mining Co. is about to erect a fine quartz mill on the War Eagle lode, in Greenhorn gulch. This mill, which is provided with 10 stamps, and is adapted to 20, is now on its way from Benton, and will be up and ready to commence running in two or three months. The mine upon which it is to be erected is considered one of the best in the country, is of good width, shows splendid quartz, and prospects at the rate of from 10 to 25 cents to the pan of dirt.

The ground in Confederate gulch, below Diamond City, bids fair to very nearly equal in richness that above the town. In the claim below the head of King & Gillett's flume, a prospect of $2.63 to a pan of dirt has been obtained, and the smallest sum taken from the bed-rock is 20 cents to the pan.

The Summit correspondent writes: The Postlewait and John How quartz mills are both running. The former is crushing rock from the Keystone ledge, which yields about $30 per ton. Work will be prosecuted on this mine during the entire winter. The John How mill is running on the Steel & Messler ledge, but soon expects to commence crushing rock from the Kearsarge, a mine which never looked better than at present. The damage done to the bed-rock flumes in the vicinity of Summit by the recent cloud burst, has been repaired, and claim owners are at work cleaning up their thousands of dollars every day, as if nothing had happened.

The Virginia *Democrat* says: The Stephens' mill is in full operation, crushing ore from the Iron Rod mt Silver City....J. T. Connor has received the machinery for a first-class mill to be erected in Brown's gulch....Deriar & Co., who have erected a smelting furnace above Bannack, are about to commence operations....Mining at Horse Prarie has been discontinued for the season ....The St. Joseph Mining Co. have completed their furnace at Argenta.

Deer Lodge *Independent*, Sept. 30th: Within a few weeks, Chas. Deidrich has taken two large nuggets from his claim in Silver Bow creek. The first was worth $500, and the second weighed 85 oz., 1 dwt., 3 grs....A new bar has been discovered in Washington gulch, from which prospects of $1.50 to the pan have been obtained.... A new quartz ledge, three feet wide, and prospecting $3 to the pan, has been discovered about 6 miles from Red Mountain City....Wm. Roo's claim, on Wallace's bar, proves rich. It has, on some days, paid $500.

NEVADA.

Humboldt.

Winnemucca *Argent*, Oct. 15th: Lay & Miller have a fine ledge, located about 20 miles up the river on the north side. A specimen of the ore was left on our table by O. C. Miller of San Francisco. He has just shipped 166 pounds to the Bay for analyzation. The sample before us is fully 75 per cent. metal. Looks as if it contained silver. If tests are satisfactory, active mining operations will be commenced. Ore will be shipped to Sacramento from that point at not above $20 per ton.

S. E. Morgan, an old Swansea smelter, is in town working up a project to erect desulphurizing furnaces to treat ore from Winnemucca mountain mines. He favors Reese's Roasting Stalls, an invention tried with great success in Baltimore, Maryland. One hundred tons of copper ore are there desulphurized by Reese with one cord of wood. Mr. Morgan's purpose is to reduce the weight one-half by desulphurization, and then ship to the Truckee for the extraction of the precious metals.

T. G. Negus shipped 87 pounds of Golconda bullion yesterday, worth about $12 per pound.

Reese River.

Austin *Reveille*, Oct. 10th: We learned this morning that the Buckeye mine, in Summit cañon, was producing good ore, a large lot of which will be brought into this city for reduction this fall. The mine has been explored to a considerable extent, in the course of which large bodies of valuable ore have been developed. It is under the intelligent management of Major Cleudon. The Buckeye is one of the peculiar mines of the Twin River region, and has attained celebrity for its large bunches of excellent ore as well as for the unique and beautiful specimens it has produced. Nearly all of the ore which has been sent to mill has yielded a large rate of silver per ton, and the lot which was extracted recently is said to be fully equal to former lots.

During the week ending this date there were produced at the Manhattan mill 30,015 ounces of bullion.

Oct. 12th: We saw this morning at the assay office of David Lundbom, 15 bars of bullion which were brought into this city on Saturday afternoon from the Monte Cristo mill in the district of White Pine. The bullion averaged .977 fine, and was valued at $20,094 50. It was produced from Hidden Treasure and Eberhardt and Keystone ores.

Oct. 13th: Work is about to be resumed on the Silver Champion ledge at Belmont.

Oct. 14th: Four bars of bullion, weighing 3,887 ounces, were brought into this city to-day from the Old Dominion mill at Hot creek.

This morning 23 bars of bullion, averaging .945 fine, and valued at $31,263 89, were brought into this city consigned to W. S. Gage & Co. The bullion is the product mainly of ore from the Eberhardt mine in the district of White Pine, and was produced at the Centenary mill in the district of Newark.

Virginia *Enterprise*, Oct. 16th: Judge Pitzer, who has for some time been out in White Pine, returned to this city day before yesterday. He says the mines of that region are the richest he has ever seen—ten times as rich as was the Comstock lead in its best days. His idea of the deposit in that district is that it resembles a bed of coal, as, for the distance of a mile in length, by over half a mile in width, no shaft has been sunk but has penetrated the rich ore. Toward the top of the hill upon which the mines are situated, the cap of limestone overlying the ore is quite thin, but, in descending, shafts must be sunk to a much greater depth to reach the ore deposit. The depth of the deposit is unknown. The ore rapidly increases in richness in sinking into the vein, and in the deepest shaft it is so rich and tough that it is very hard to sink in it. A pick leaves a hole in the ore such as would be left in a mass of lead by a blow with the same tool. There can hardly be found in the lead any kind of ore that is worth less than $500 per ton; in fact the whole deposit is "fearfully and wonderfully" rich.

Virginia *Safeguard*, Oct. 16th: Geo. W. L'Amereoux and Wash. Green returned to this city yesterday, having been absent nearly four months on a prospecting trip through the southeastern portion of the State. About 150 miles east of Virginia they discovered some fine ledges, which they located, and for a time worked them with arastras, but owing to there being no feed for horses in that section, they were compelled to quit work. The rock is rich, free gold can be seen sprinkled all through it, and every indication looks favorable for another White Pine District. Shortly after making the location they organized what is now called the Black Mountain Mining District. It is the intention of Green and L'Amereoux to make arrangements for a small mill, which they intend erecting near the mines. They brought 100 pounds of rock with them, which they intend having worked here.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district

Virginia *Enterprise*, Oct. 13th: The Savage mine is looking exceedingly well and stockholders may rely upon regular dividends for at least one year to come; indeed, the chances are that the company will pay dividends of from $20 to $15 per share before three months have passed. The mine looks as well throughout as any stockholder could wish. The north winze in the fifth level is now down 33 feet and is fast developing a new—entirely new—body of very good milling ore; the winze in the south mine, 70 feet below the fifth level, has already developed some very rich ore in an east drift from it, and will in a few days find the ore body descending from the fifth level to the sixth level. It (the winze) was sunk 30 feet west of the ore.

The body of ore struck in the 810-foot level of the Yellow Jacket mine is proving exceedingly rich. From this deposit a single chunk was yesterday taken that weighs 160 pounds. This chunk throughout is rich enough for a cabinet specimen, as it assays at the rate of $3,000 per ton (principally silver), and is sprinkled over the spangles of native gold. The extent of this new and immensely rich body of ore has not as yet been ascertained.

On Saturday last Vicompte de Suarez D'anlan, "Attache a la Legation de France" at Washington City, and Professor L. Simouin, Engineer of Mines, from Paris, France, visited our city. These gentlemen have visited the principal mines in Colorado and those of Austin, in this State, and after having examined our mines will proceed to California and visit the most noted mines of that State. Prof. Simonin was much pleased with the hoisting works of the Savage Co. He said that in all his travels among the mines of Europe, he had seen nothing so fine. He was much astonished at seeing everything about the works so neatly finished, painted and kept. He found about the works many things new to him—the arrangement of the cages, the safety apparatus, the dials showing the amount "paid out" by the reels, the plan of working the signal bells by means of electricity and telegraph wires, etc. The Professor is confident that all our intractable ores may be easily and cheaply worked by the same processes that are in use in Europe for the reduction of similar ores. He was sent by the French Government to examine the mines and mining and milling works of the United States, and will be able to give a report flattering to the skill of our mining engineers. He considers the mines of the Comstock, with their fine and costly works, the greatest in the whole world. He is taking many specimens of all kinds of ores from our principal mines, but appears most interested in those containing a large per cent. of base metals, and which here are considered intractable.

NEW MEXICO.

The Santa Fe *Gazette* has seen the certificate of assay of a piece of rock, from the Aztec lode, near Maxwell's house, in that Territory, and says that it is the biggest thing in the assay line they have seen or heard of in a long time. Here it is: Gold, $19,455.37; silver, $189.88. Total, gold and silver per ton, $19,645.25!

OREGON.

Portland *Oregonian*, Oct. 10th: By a party just returned from Willow Creek mining camp, we learn that there is no doubt of rich diggings existing in that region of country. They expect by another year to have plenty of water to work the mines when they will be thoroughly prospected.

UTAH.

Salt Lake *Reporter*, Sept. 28th: W. P. Clark came into our office this morning, with a rich specimen from the mines in Bingham. It is a beautiful bit of the natural ore, about the size of a hickory nut. Mr. Clark thinks Bingham will astonish the world with its richness.

Mountains Laboring.—Strange phenomena are reported in the Sierra Nevada Mountains, at the head of Kern river. The earth is said to have been shaking for more than two weeks—almost a constant shake, rolling rocks down the mountain, and the earth waving like the sea. It is supposed that it is a volcano getting ready to burst out. The mountain is supposed to open like a hinge, hence it is not felt at a great distance off. The atmosphere has been very thick there for a week.

An Inyo correspondent of the *Union* says: Yesterday another fishing party returned from Kern river. They report that the country there continues very smoky, and also that they saw, one day when the wind had thinned the smoke considerably, a large column of dease smoke rising from the mountains in the direction of Walker's Pass. About twenty times a day they would hear a loud noise like distant thunder, followed immediately by a jarring of the ground, not like an earthquake, but more resembling the sensation felt while firing heavy artillery. Only five or six earthquakes were felt while the party remained there.

North New Zealand Gold Fields.—A private letter from the Thomas District, 50 miles from Auckland, says:

A friend of mine crushed two tons of quartz, and the yield was 1,200 ounces of gold. It is considered a poor claim that will not yield two ounces to the ton. The ground here has been opened ten months, but we have had no emigration as yet from the colonies. They seem to think it a boax, and I hope they will keep of the same opinion. The charges for crushing are at present thirty shillings per ton, and it would pay well for some of your enterprising merchants to export good quartz machinery to this country. Coals can be bought on the ground at thirty shillings per ton; the gold field lies within two hundred feet of the landing, and roads are cut through all the gullies by the miners.

Another cable is proposed and the company is forming in Berlin. One of the arrangements is that the subscribers will receive bonds, which they may use in paying for the transmission of messages after the line is in working order.

Blockaded.—The rush to the White Pine mines, with the unusual travel overland to the Atlantic States, has blockaded the Overland coaches beyond Wadsworth.

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the Mining and Scientific Press, *free of charge*; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus debarring those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

Patent Rejections.

First. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

Second. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

Third. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:

Saturday Morning, Oct. 24, 1868.

Notices to Correspondents.

PROSPECTOR, Plumas County.—We are only enabled to give you a somewhat indefinite account of newly discovered gold fields in China, for there has been more than one; in the first place a French exploring party discovered some gold bearing rocks in the southwest provinces of that empire, bordering on Thibet. Such a circumstance was sometime previously indicated on theoretical grounds in the columns of the MINING PRESS, by our fellow citizen, Prof. Rowlandson. The value of these, however, is as yet unknown to the general world. The discovery of gold mines in the province of Shantung,—as yet supposed to be placer mines only,—is the one, however, to which you allude, as these have caused considerable excitement amongst the Chinese population generally, but as will be gathered from a quotation which will follow, is likely to stimulate the torpid motions of the Chinese Government: "But in addition to the above, the government of Pekin is likely to be rudely aroused by the discovery of gold in Shantung, and by the advent of fillibustering miners from California and Australia. Should gold prove abundant here, nothing can prevent a hive of adventurers coming, and what the Pekin Government refuses to do, what our diplomatists are afraid to demand, promises to be brought about by accident." The extract given is from a letter forwarded to this office from a gentleman whose name at least is well known to a large number of our readers.

BRETON, French Corral.—M. Buret, on observations chiefly made by M. Elie de Beaumont and M. Dufrenoy, has described the peninsula of Brittanny (France) comprehending in a geological view the Boccage of Normandy, La Vendee, and a part of the departments of the Sarthe, and others. When these observations were made, geologists were accustomed to employ somewhat indefinitely the term graywacke, and paleontological in place of lithological evidence was only beginning to obtain that importance which has since been accorded to it. At the time alluded to the rocks comprised in the district under notice were denominated upper and lower transion, the series comprising sandstones, conglomerates, granular and compact quartz rock, limestone, granwacke and slates, the two last in the lower series passing into mica slate and gneiss penetrated by granite. The upper series are more or less carbonaceous; anthracite beds being found in many places, in some sufficiently abundant to be economically worked, as at St. George, Chatelmaison, Montrelaise. The upper transition series belongs to what is now generally termed the upper Devonian system.

CYCLOPS, El Dorado County, wishes to draw the attention of capitalists from the successful example of the Oregon Iron Works, recently noticed in this journal, to this field of profitable enterprise in this State, stating that not only does El Dorado contain some fine openings for such, but Mariposa, Sierra and other counties, also, are rich with the best of iron ores.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Wednesday's Earthquake.

To commence talking about an earthquake like that of Wednesday, is to open up a field so broad, that the natural impulse is to slight it. We know nothing about earthquakes—except that they are like a universal railroad smash-up. Once launched upon a narration, or a theoretical discussion about earthquakes, and the listener will have to look to it or he will get the worst of it. Not that the facts are not exciting, or that the philosophy is not interesting—it is even extremely fascinating—but there is so little that has not been experienced, or that has not been said before, and so much that can be said which is to no purpose.

As to the facts, they can be condensed into a few paragraphs. Time, 8 A. M., Oct. 22; direction, variously apprehended, but pretty positively either from southeast to northwest, or the reverse, buildings having been generally thrown toward the southeast; motion of the surface during the severest shocks, more horizontal than vertical, but in some of the subsequent tremblings almost perfectly vertical; size and hight of the earthquake waves, and direction and degree of the force relative to the earth's center unknown, from want of proper instruments to record the same, and comparison of observations in different localities; duration of principal shock about 45 seconds; weather dead calm and foggy in town, at Point Lobos a light breeze from the northwest, and hazy, as it had been more or less for weeks; thermometer and barometer about as usual. In the evening the atmosphere became beautifully clear and invigorating. The reported focus of severity and damage was, according to many observers, not far from Hayward's, in Alameda County; it is safe to say that it was within a radius of 16 miles from that place. As to the degree of damage done to property, it can be understood only by taking a walk through town, and observing the houses, walls, cornices and copings that have been thrown down; probably not over a dozen buildings were utterly destroyed, but hundreds were left with marked evidences of injury. Lives lost, so far as reported at the Coroner's office, six; wounded or hurt, about four dozen. Whether the rumbling sound accompanying the earthquake proceeded from the interior of the earth, or from the motion of loose bodies on the surface, was not apparent, but was settled both ways, by guess.

If mosquitoes and other evils have their purposes—the school-boy's puzzle—earthquakes may be designed for some good end as well. They furnish us at least with a motive and the means to ascertain the nature of the interior of the earth, and may enable us to develop, in good time, a new branch of geology, and of cosmial astronomy. The data are presented to us from time to time in the most unpleasantly personal and direct manner. Some day not far hence we may rest assured that we shall know a good deal more of their philosophy than we do now, for it is not many years since that Werner and von Buch developed the first principles of Geology, and before whose time we were as ignorant of the signification of the rocks that we stood upon as we now are of the interior,—which is accessible to us not merely through the phenomena of earthquakes, volcanoes, and terrestrial magnetism, but is subject to all of the general laws of physics and chemistry; or perhaps we should say the innate union of those branches, where they pass over into each other and are governed by common and more general laws—a field where the most advanced observers and thinkers are yet at fault. That we are very ignorant on the subject, is certainly not a good reason why we must continue to be so forever; and if we are to deduce anything from the triumphs of human thought and life, as presented to us in history, it is rather that man was born to be a demigod, to control and direct nature's laws and forces everywhere relating to his sphere, than that he should be baulked by insurmountable walls of forced ignorance, where he is forbidden to exercise his most natural trait of unlimited inquisitiveness and unlimited ambition.

Should we ask ourselves what do we know about the interior of the earth, the answer would not be entirely barren. We may arrive at even a few points of certainty concerning earthquakes. We know, for example, that the earth is not round, but a spheroid; and that nothing could have made it a spheroid but revolution on its own axis while in a plastic state—or turning it on a lathe. Having been soft, it was either a wet or dry plasticity—either a ball of cold mud, as superannuated old Prof. Schafhaeutl of Munich says it was, or of heated plastic rock. Facts deciding that question pretty conclusively are, that the earth is proven to be hot in the interior now, by undoubted regular increase of temperature in mining, below twenty-three feet of depth, and by the emissions of melted or eruptive rock from volcanoes and cracks, (volcanic dikes) existing, or having existed, in every country, all over the globe; furthermore, by the circumstance that active volcanoes are arranged along systems of great lines encompassing a hemisphere or the globe itself, as the line of the Andes, Rocky Mountains, Alaska, and Japan. Could any one desire facts more conclusive, to prove the existence of anything that he cannot see?

Earthquakes are known to be intimately connected with actual eruptions of melted rock; and the great volcanic lines, as well as the regions of earthquakes, are observed to be everywhere near the sea. All the philosophers agree that heat, operating in one way or another, causes the earthquakes; but some will have it that it is by suddenly making and condensing steam; others that it is by causing specifically light gases or fluids, which undoubtedly exist in the interior without being dependent upon the agency of water, working up towards the open volcanic vents, as molasses when fermenting, will work out of a bung-hole, or burst the barrel; others, that great masses in the interior, from long continued chemical reaction, will occasionally change their relative center of gravity, in doing which the crust would be more or less disturbed; and still others, like Dana, hold that the gradual cooling of the globe, which is established by the changed character of present from fossil animal life and other data, in causing the wrinkling of the crust like that of the skin of an apple, has put into operation a constant lateral pressure, by which rocks are disposed to shove each other up into hills and mountains, and that many of the lighter kind of earthquakes are caused by strata consequently slipping by each other along a fissure, as we see so frequently has been done in the faults as found in mineral veins.

Anybody is at liberty to select one or all of these causes, as the ones most satisfactory to him. Possibly all of them are actually existing causes of earthquakes.

We feel earthquake shocks in waves,—vertical, horizontal or contorted. Readers of the PRESS will remember a series of articles published just after the earthquake of 1865, on the physics of vibratory waves traveling through water, iron or rock, which amply explained every feature of ordinary earthquake phenomena, and need therefore only to be referred to in this connection. Being the result of internal concussion or jarring, the earthquake wavelets must travel like the enlarging circles seen where a stone is dropped into the water, modified of course in their behavior by the circumstance of origiuating either from a point, or from a crack, or line of disturbance.

A REAL ESTATE PAPER is about to be started in this city by Turnbull & Smith, printers.

A New Textile Material.

On the Santa Clara plains, and almost anywhere else around the bay, or in the State on low valley land, there grows profusely a plant whose name and appearance are well known to everybody, but especially to roving children, who recognize in it one of their most familiar botanical acquaintances, and designate it, after its fruit, by the common name of *Cheeses*. This is the *Malva Rotundifolia*, or Mallow, in dignified English. Amongst the myriad of commonplace objects to which our eyes are daily accustomed, how often is it that a little more information as to their qualities and capabilities, or even some slight stimulation or suggestion to cause us to inquire into such matters, might open to us undreamt of resources? The door-yard mallow furnishes a textile material, in this State, apparently equal to hemp. Its growth is so much more luxuriant and tall than at the East, and its distribution so general, that inexhaustible quantities of it, easily reaped, are at this moment standing ready to be harvested with the mowing machine. All that was wanting was the little trifle of knowledge which "is power."

W. Frank Stewart, of San Jose, whilom of Nicaragua, has placed on our table some specimens of this plant and a quantity of the hempen material derived therefrom in the same manner that hempen threads are separated from their stalk, which it resembles in size and appearance; and the following is the story of the discovery of this useful property of the mallow.

A German who is living modestly, as Germans do, in a little house and garden outside of San José, considered himself sorely pestered by the dense growth of these stalks in his garden, and began bestowing his special energy and ill-will upon the same, at leisure times, by cutting them off, and throwing them upon heaps or over the fence. But he had not conquered all of them when, one day, in moving a partially rotted heap, he broke one of the stalks in his hands in such a manner as to cut his finger. He discovered the sharp, strong thread that did it—and at the same time the quality and quantity of the textile material which is found under the bark. Not fully realizing the industrial importance of this discovery, he showed his bleeding finger and the cause thereof to somebody else; and the result is that a patent has been applied for through the MINING AND SCIENTIFIC PRESS Patent Agency for the use of the Malva Rotundifolia as a textile material; its product being adapted to the manufacture of hagging, of which there is consumed annually in this State the value of $1,200,000 for the grain crop alone, the foreign bagging being subject to a duty of 30 per cent *ad valorem*.

OBITUARY.—William Kellogg Strong, an estimable young man, native of Portland, Ct., who was in the office of the MINING AND SCIENTIFIC PRESS at the time of the late severe earthquake shock, and who unfortunately lost his life in trying to escape by being buried under the ruins of the adjoining building, was interred yesterday at the Masonic Cemetry; funeral services having previously been held by Rev. H. A. Sawtelle, at the Union Square Baptist Church, attended by a number of his acquaintances from this office. He was aged 27, and had been in California but a few months.

PRESIDENT OF THE STATE UNIVERSITY.—It is reported, and assumed by the Oakland *Transcript* to be correct, that a majority of the Board of Regents of the State University are in favor of appointing George B. McClellan as President of that institution. The story surely cannot be anything else than a slander.

B. P. SPECTACLES.—The genuine Brazillian pebble can be had at C. Muller's, 205 Russ block. *

The Railroad and Wagon Roads to Idaho.

Winnemucca is now the depot of the Idaho trade. This town, of 2,000 inhabitants, with a good and sufficiently peculiar sounding name to begin favorably upon its historical career, being appropriately named after Winnemuck Peak and the frowning war chief of the Pi-Utes, is located nearly half way across the State of Nevada—not quite so far as Austin—and at the most northerly point of the road on Humboldt river where it forms its great bend; and is in such a position as will, in all probability, secure to it permanently the Idaho trade and all its northern communications. Our attention has been favorably drawn to this section by a visit from Mr. Joseph Wasson, editor of the Winnemucca *Argent*, a paper which, from its auspicious location, is destined to be frequently heard from. The railroad is completed and opened sixty miles beyond Winnemucca, and by Oct. 24th it will be completed to Reese River station, opposite Austin, to which point a stage road is just completed; so that during the coming week Wells, Fargo & Co's communications will be made by that route, the company having already partially hauled off its stock and material from the old road.

Towards Idaho there are two routes from the railroad, that from Winnemucca to Boise, which is a good, natural, and completed road; and the route from Maggie Creek, via the south fork of Owyhee Creek, which is a little nearer for the wagoning, but less direct on the whole, and is said to cross at least one considerable range of mountains; the road being now in progress of construction. One advantage in favor of the latter place as a center will be its communication with natural routes leading southward.

Many improvements are being made at the railroad depot in Winnemucca. The company have a freight-house nearly finished, 32x100 with 12-foot platforms on each side, over which the roof extends. Rankia Thompson is putting up a building 16x40 feet, and Sisson, Egbert & Co. have their new store well nigh completed, etc.

What Causes the Smoke?—The Great Spirit of the Coast Mountains is still ruminating. Why should he be burning so much of his brown barked killikinnick in these days? Capt. Johnson of the schooner Mary Reed, from Coose Bay, Oregon, reports that while off the coast near that place he encountered smoke so dense as to be almost suffocating, which seriously obstructed his progress; and that in one day 300 birds fell dead on the deck. They must have been found implicated in some foul plot, or some illegal and rebellious confabulation that incurred the Great Smoker's dreadful displeasure;—and this is the lesson, which will be long remembered, and told over, with wise reflections no doubt, in the communities that flock together on lone and wave-worn rocks. But what it all signifies, of course *we* dare not venture to say. Were we to ask of those privileged individuals who pretend to know, we should be informed, probably, that something is "about to happen." We suspect, however, that the Great Spirit simply has something on his mind—some weighty and unusual question. Can it be that the mighty changes which are threatened by the early completion of the Pacific Railroad, have anything to do with it? Railroads are pushing up, or beginning to look up, every green valley on our shores and in the interior, that promises to furnish peaceful and happy homes for the emigrating families of our cosmopolitan race. The road-builders and the farmers,—the men who look through levelling instruments, and those who go out with guns and return with ideas of speculation in lands,—are a rude, encroaching set. Great events, and great changes of empire are being enacted, as everybody can see, without being told. Is it not matter enough for a few extra whifs?

MINING AND SCIENTIFIC PRESS

DEWEY & CO., Publishers,

Office, 414 Clay St., below Sansome, San Francisco.

Subscribe for the Mining and Scientific Press.

The Press was established in 1860, and has been enlarged from time to time, until it now contains sixteen pages—size of *Harper's Weekly*.

It is printed on extra quality of paper, rendering it a handsome volume to file for future use.

A large amount of editorial labor is constantly expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations are given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number treats carefully on subjects of home trades, manufactures and domestic economy.

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

"Answers to Correspondents" afford much of interest to readers and of advantage to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The Press, as a mining and mechanical journal, has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

PRINTING OF EVERY VARIETY CORRECTLY AND PROMPTLY DONE.

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To Engraving and Electrotyping, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

The Best Advertising Medium on the Pacific Coast.

Our terms for advertising in the Mining and Scientific Press are very low considering its wide circulation among the most intelligent and industrial classes

☞ All advertisements inserted in the Press are contained ☜ in the Monthly Series of the Mining and Scientific ☞ Press, which (by special arrangement) are placed for ☜ free reading in the principal hotels, steamboat and ☞ steamship saloons, depots, and public libraries in San ☜ Francisco, and the Pacific States. Many volumes are ☞ also bound, thus affording permanent advertising.

DEWEY & CO.

Treatment of Ores by Electricity.—In a corner of the Union Foundry, Mr. Pioche and a French chemist, Mr. L. Nolf, have for some time had a laboratory specially fitted up, and been making experiments for the separation of gold and silver from their ores by means of electricity. An article claiming the success of the process, but giving no further information as to the *modus operandi*, or the principles taken advantage of, appeared in the French *Courrier de San Francisco* a few days ago, over the signature of Pierre Cauwet, the editor of *Journal de Lundi*, and the results of the reduction of two tons of ore are promised to be given to the public shortly. Booth & Co. are engaged in manufacturing the necessary apparatus for the operations of the process; which, as we understand it, is intended to reduce the gold and silver to a metallic state, in order to amalgamate the more freely and thoroughly. Readers of the Mining and Scientific Press will remember of attempts that were made in 1863 and afterwards, by Messrs. Scott, Veatch, Kean and others, to benefit by the disiategratiag powers of electricity, using various modifications of the Becquerel process, which was first tried at Grenelle, near Paris; and a review by Dr. Lanszweert, of what had been attempted prior to November, 1865, will be found on p. 306, vol. XI., of the Mining and Scientific Press.

Paying.—The Omnibus Railroad Company have declared a dividend of ½ per cent. for the month of September, amounting to $5,000.

The Pacific Tannery and Boot and Shoe Company have declared a dividend of 1¼ per cent.

Sulphurets and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

Notice.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

Co-Operative Union Store.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

Wanted—By a Civil Engineer of twelve years experience in Railroad, Water Works, Mines, etc., any professional or other work; is willing to take a reasonable salary, and would invest half of it in any promising stock or enterprise. Holds best Eastern and California references.

Address, W. STEWART.
17v17-1t San Francisco.

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

I T
will heal
old sores, piles,
ulcers, cancers,
saltrheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instantly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 539 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

SAFETY FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - - Potrero, San Francisco.
JOS. POWNING, Sec'y. JAS. EVA, Supt.

IMPORTANT TO LUMBERMEN.

ANDERSON'S
Patent Mulay Saw Hangings.

These Mulays will cut FIFTY PER CENT. MORE LUMBER PER DAY than any other Mulay in use, with fifty per cent. less power. They are very durable, and easily kept in order, and warranted to give satisfaction. No Mulay Mill should be without them, as they will pay for themselves in a very short time. No other mode of manufacturing Lumber can compete with the Mulay Saw with this improvement. Send for circular.

FULLER & CO.,
Manufacturer's Agent for the Pacific Coast,
109 MONTGOMERY STREET, SAN FRANCISCO.
17v17-3m

IMPORTANT TO WOOD WORKERS.

GECER'S COMBINATION
PATENT
Variety Molding and Planing
MACHINE.

This standard machine is indispensable in any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10y-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,

SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first-class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

NEW BRANCHES OF INDUSTRY.—In Santa Cruz and Monterey counties many of the farmers have turned their attention this year to the cultivation of flax. The Stockton *Gazette* says the first experiment in flax was made in 1867, and the result was so favorable that it is being tried again on a more extensive scale. Some persons have planted as much as 50 acres, and all seem fully convinced that the crop will pay largely. In Monterey County many large tracts of land were sown with white English mustard, which is now being threshed; it sells at from four to six cents per pound, a price that yields to the producer a handsome profit.

DEWEY & Co.,

Mining and Scientific Press Office, San Francisco.

A SNAIL IMBEDDED IN QUARTZ.—The *Territorial Enterprise*, of Oct. 8th, says:

We were yesterday shown a decided curiosity in the mineralogical or geological way, being nothing less than a snail firmly imbedded in a piece of quartz. It was found thirty feet below the surface of the ground, in the Varieties claim, Rocky Bar, Yuba District, Idaho. The back of the snail only is visible, projecting out of the rock, but it is so perfect in appearance that no one can fail to detect at first sight that it is unmistakably a *snail*. How this unfortunate snail came in that adamantine position is a matter for speculation for the curious, as well as for the scientific *sarans* who say all quartz veins are formed through the medium ship of gases and other similar influences proceeding from the interior of the great globe.

The "*sarans*," it would seem, have a very lucid idea of how the quartz gets there. An endless number of cases like the present, are recorded where scientific people are agreed that the quartz can have been deposited only from a watery solution, and in the same manner that wood is petrified, or that silicious sinter is formed around certain springs. Alkaline waters will dissolve quartz like sugar, under warmth and pressure.

PETERMANN'S WORKING UP OF ARCTIC GEOGRAPHY.—Dr. Petermann, of Gotha, the celebrated German geographer, and head of the expedition which started last spring from Bremen to advance to the North Pole, has written a recent letter to the Prussian Consul, Schaefer, at Honolulu, in which he refers to the interesting communications which the *P. C. Advertiser*, of the 9th November, 1867, contained in regard to the discoveries made lately in the Arctic seas, by American whalers. He mentions in this connection particularly, the name of Capt. Long, also Captains Raynor and Bliven, and states that all their reports had been translated into the French and German languages. Dr. Petermann desires that some log books of Arctic voyages of this and preceding years, may be sent to him, believing that in no other way the experience of captains of whaleships could be made more useful to the world at large than in so doing.

METALLURGICAL EXPERIMENTS IN INYO.—A new process of working ores is proposed, and being tried by a miner of this county, which, so far, consists in placing the quartz or gold rock (as the case may be) dry crushed into an iron cylinder, with a quantity of mercury, and applying a low degree of heat to the whole. The cylinder is then made to revolve rapidly. The new method is said to work well in small quantities, and the inventor says he is sure of being able to work much larger quantities when suitable machinery is erected.

MINERAL NITER.—Owing to the destruction of the nitrate works at Iquique, South America, by the great earthquake, the estimated deficiency in the production and shipment of nitrate of soda for the next four months will amount to full 400,000 bags, which has already had the effect to advance the price of all kinds of gunpowder fully fifty cents per keg.

At Iquique 167,000 quintals of saltpeter were washed away by the sea.

THE POSTAL ORDER SYSTEM.—The amount of money transmitted by the money order Post Offices during the fiscal year ended June 30th, is about $15,000,000. The amount transmitted by this system in the last fiscal year was $9,000,000.

SAN FRANCISCO TIDE LANDS.—The survey of the tide lands is now nearly completed, and the sale will soon take place.

THE Rockbridge Alum Springs, in Virginia, have been sold by auction for $236,000.

IN England there are over 700 coöperative associations, while Prussia has over 1,000.

HOP STALKS are capable of being manufactured into excellent coarse cloth and cordage.

MANUFACTURER OF
Cocoanut Matting, Rugs, Mats, Etc.
And Cocoanut Fiber for Upholstery,
South side Chestnut street, bet. Polk and Larkin streets.
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purposes:
1st. It is cheaper, all things considered, than most articles in use.
2d. It is the best and purest material known in the market, being entirely free from all offensive smell.
3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.
4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.
5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.
Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tm

OIL STOVES!
MORRILL'S
Petroleum and Universal Oil Stoves
Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.
I now offer a reward of $100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by
M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.
N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

AT PRICES TO SUIT ALL.
FURNITURE AND MATTRESSES
Made to order.
All kinds of upholstering executed with neatness and dispatch. 9v17

Removal and Partnership.
Notice is hereby given, that I have removed from my old stand on Beale street, and have formed a co-partnership with Mr. A. CAMERON, for the purpose of carrying on the business of Stair-Building, Wood-Turning and Scroll Sawing. The business will be conducted as formerly at Cameron's, corner of Market and Beale streets, and also at Nos 485 and 487 Brannan street, where ample steam power and all necessary facilities have been provided for every branch of the business.
Different sizes of Redwood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.
15v17-3m N. P. LANGLANO.

To Inventors.
The undersigned is now prepared to assist inventors or others by manufacturing Models for the Patent Office, large working Machines or Devices of every description, in Metal or Wood, in the most workmanlike manner and at reasonable rates. Also, Patterns for Iron and Brass Work and all kinds of Machinery.
Having had ten years practical experience in this city, parties can be assured all work entrusted to me will be executed in a prompt and satisfactory manner. Power will be granted to parties wishing to test or experiment with machinery.

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer,
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 4 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore millmen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me. 5v17-1y

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

THE NATIONAL ACADEMY OF SCIENCE.—This was incorporated by act of Congress in the early part of 1863, for the purpose of bringing together in an available manner, the most eminent learned scientific men of the country, and enabling them by their counsel to assist the government in the solution of questions of a scientific character and of national importance. During the first year six questions were submitted to the Academy by the government, among which were inquiries as to the best method for the protection of the bottoms of iron vessels from corrosion by sea water and from fouling, and on methods of protecting the national currency from being counterfeited. These, and other investigations carried out by committees of the Academy, are said to have already saved for the government large sums of money, and to have practically demonstrated the usefulness of the organization, and the wisdom of the step that resulted in its foundation.—*American Journal of Mining.*

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

PACIFIC STATES AGENCY, 418 Montgomery street, San Francisco. AGENTS WANTED. 6v17tf

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

BUERK'S
Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.

A New Treatise on Concentration of All Kinds of Ores.

INCLUDING THE CHLORINATION PROCESS FOR Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally, by GUIDO KUSTEL, M. E. & M., author of Nevada and California Processes of Silver and Gold Extraction—120 lithographic diagrams.

OPINIONS OF THE PRESS.

KUSTEL'S NEW WORK.—Mr. Guido Kustel has not put forth another volume, a copy of which we have received from tho publishers, Dewey & Co., San Francisco. The book contains 120 diagrams on seven plates. In issuing tho work, the design of the author appears to have beeo to exhibit the present state of the art of concentrating ores as practiced io the older and more experienced mining sections of the world, as well as in the more recent mining operations in California. The principles on which the system of concentration is founded aro stated without entering into scientific reasons.

The dressing of ores is treated at great length, and the plan is based on these principles: "1st. Each constituent of tho mass of oro must he brought to the highest value which can advantageously be given to it. 2d. The useful minerals must be concentrated only to the most advantageous degree of purity; and, 3d. All loss of the quantity and value of tho useful mineral must be avoided as far as practicablo." Reduction in its diversified modes—by rock-breakers, stamps, rolling mills, and grinding in arastras, pulverizers, Chili mills and pans—necessarily occupies large space by reason of its importance.

The plan of reducing ores by stamps, in either tho wet or dry process, forms a complete treatise of itself, and may be studied with advantage by all persons connected with reduction works of that character. Concentration of gold ores is specially treated in section 49, and of silver ores in section 50. The latter subject should possess interest for our millmen and miners, as tho plan of concentrating ores is certain to be resorted to as soon as the bnsiness is understood and reduced to a system.

Tho sections of the work devoted to the extraction of gold from sulphurets, arseniurets, or quartz, by chlorioation, aro based on Plattner's process of the property of chlorine gas to transform metallic gold into soluble chloride of gold. By this process it has been demonstrated that gold is extracted perfectly. Our author says the process was first introduced into Nevada, California, in 1858, where there are several establishments in successful operation.

The process of chlorination is described in the fullest manner, and embraces a particular description of the various roasting furnaces in use, as well as of the operation of roasting.

We commend Mr. Kustel's treatise to the attention of all concerned in tho business of mining and reducing ores, to whom it must prove a valuable hand-book of practical knowledge.—*Daily Reese River Reveille, Jan.*, 1868.

Price of the work, $7.50. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS, San Francisco, who will supply orders, by mail or express, at wholesale or retail.

ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

Machinery.

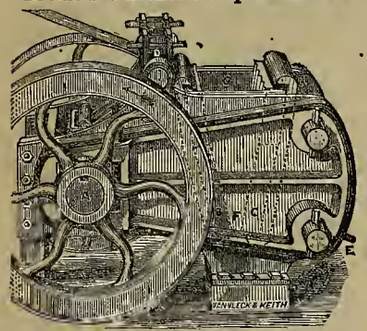
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

for rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 9-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... $600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

HYDROSTATIC WORKS.

SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞ This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere. ☞ I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address NEWEY & CO., Mining and Scientific Press office, San Francisco.

DEFOE'S ISLAND, where the adventures of his hero, Robinson Crusoe, actually took place—minus the novelist's imaginative coloring—was not Juan Fernandez but Trinidad, at the mouth of the Orinoco, or perhaps a smaller island in the same vicinity; and the shipwrecked mariner whose experiences furnished the ground-work of Robinsou Crusoe was Peter Serrano, a Spaniard. The original title, and ample internal evidences, locate the scene of the story unequivocally at the mouth of the Orinoco.

AMERICAN LEAD PENCILS.—All first class lead pencils have been manufactured in Europe until recently. The American Patent Lead Pencil Co., of New York, have now taken the field, and are supplying the market with a good article of home manufacture. An agency has been established in San Francisco, and Mr. Fountain, of Oakland, has engaged to introduce the new article to the trade in the interior.

HOME OF THE SANDWICH ISLAND LEPERS. Passengers from California to Honolulu have generally a fine chance, coasting along the northern shore of Molokai, the day previous to coming into port, to admire the cloud-capped precipices of that island. At the foot of those *palis*, almost unnoticeable from the sea, is a shell of rich land. Here with cliffs in the rear, and the broad ocean on three sides, is the secluded place allotted to a class of people whose number has rapidly increased during the past year. The Chinese leprosy has spread most lamentably among the Hawaiians of late, and all attempts at isolation have seemed to prove unavailing.

GEOLOGICAL SURVEY OF COLORADO AND WYOMING.—Prof. F. V. Hayden is actively engaged in the prosecution of the geological survey of Colorado and Wyoming Territories. Fine collections have been made of minerals, such as coal, iron and building materials. The Professor has had the opportunity presented him of making a tour on the Union Pacific Railroad towards Fort Bridger, a portion of the country full of interest to geologists and mineralogists. On the return of the Professor, his party will go to Denver, Colorado, crossing the Black Hills. The Professor intends to make a thorough examination of the mining region, giving special attention to coal and iron.

CENTRAL PACIFIC AND OREGON RAILROAD. At a meeting of the stockholders of the California and Oregon Railroad, held in this city last week, the following persons were elected Directors: Leland Stanford, E. B. Crocker, C. P. Huntington, Mark Hopkins, Charles Crocker and E. H. Miller, Jr. Leland Stanford was chosen President; C. P. Huntington, Vice-President; Mark Hopkins, Treasurer; and E. H. Miller, Jr., Secretary.

THE NATIONAL LABOR CONGRESS has been discussing the question of strikes on a motion to strike out of the platform the clause condemning them. In this discussion Miss Susan B Anthony had a good deal to say. She believes in strikes, she said, and also in special Providences. The motion was not agreed to.

SILVER MINING will be profitable some time in England. The weight of silver lost by abrasion in that country in the course of a year—and of course it ultimately goes to the soil—is 54,750 ounces.

SUPERSTITIOUS Iowa farmers harvest their wheat at night from an impression that the moonlight makes the straw soft and easier to be handled. The condition of the atmosphere has more to do with it than the moon.

THE Illinois State Geologist happened to stray into an Indiana city with his bag of stone-breaking tools, and was carried off to the station house by the police as a burglar.

It costs $32 per foot of draught to get in and out of the Columbia river, for all vessels drawing ten feet of water or less, while large ships pay as high as $72, besides towage, which amounts to from $100 to $500 each way.

SAWING ON THE TRUCKEE.—At Jones' mill, on the Truckee, there were sawn in 11½ honrs, recently, 63,374 feet of lumber.

THE Petaluma Railroad is progressing steadily. The road is graded to within 11 miles of Santa Rosa.

CAPT. STONE has launched a little steamer on Tulare Lake.

GRAIN RAISING BEYOND THE SIERRA.—Statistics are given in the Susanville *Sage Brush*, estimating this years' grain crop of Lassen County at about 7,750,000 pounds, worth $155,000, which would pay an interest on the entire assessible property of the county of at least 25 per cent., or 50 per cent. of the real property alone; while not more than half of the realty of the county can be estimated as grain ranches. The *Sage Brush* adds: We may, then, easily calculate from these figures that each farmer has this year made from his grain alone, the assessed price of his ranch. It seems to us that the farmers themselves, as a class, are hardly aware of the amount of money they are making annually from grain.

CHEAP TELEGRAPHING.—The Western Union Telegraph Company are sending messages between San Francisco, Sacramento, Stockton and San José for 15 cents for the first 10 words, and five cents for each additional five words. The Atlantic and Pacific States Company have also lately reduced their rates to the same points doing business for 25 cents for the first 10 words, and 10 cents for each additional five words.

A MEXICAN POMPEII.—The inhabitants of Tuyahualco, District of Chalco, in Mexico, while quarrying recently, came suddenly upon a mysterious town, sepulchered amid volcanic lava, within which were found the houses and corpses of its former denizens, perfectly mummied. The volcano that produced this disaster must have completely disappeared at the time, burying beneath its ashes and lava all the ancient towns and occupants of its environs, whose existence is not mentioned in history.

NEW THEORY OF EARTHQUAKES.—The following notice was proclaimed, with beating of drums, by the magistrates in the little town of Jasseburg, in Hungary, on the 23d of August last: "Inasmuch as oaths and blasphemies are the true cause of earthquakes, everybody is forbidden to swear and blaspheme, under penalty of twenty-five stripes and a fine of thirty-five florins."

PACIFIC RAILROAD AND OAKLAND FERRY. The report that the Central Pacific or Western Pacific Railroad has acquired a controlling interest in the Oakland Ferry, is supported by the fact that one of the ferry boats is now used by railroad folks to transport rails to Sacramento, and thus to help hurry forward material for the work on the plains.

LADIES' VELOCIPEDE RACES are now announced in France. The French Empress, it is said, is very partial to this kind of exercise, and rides in the park and takes long excursions in the country on her mechanical steed.

Prof. Stoddard stated, at the recent meeting of the American Association at Chicago, that he had been witness of an accident in Indiana, where lightning was carried five miles on a telegraph wire without melting it, but shattering three posts.

GOLD mining speculations are multiplying in Nova Scotia. The Lieut. Governor of that province has just assented to the acts of incorporation of twenty-eight new companies.

THE exodus of miners and their families from Cornwall, England, continues, in consequence of the hard times.

THE Arizona *Miner* says working men are badly needed in Yavapa County, and will be for a long time.

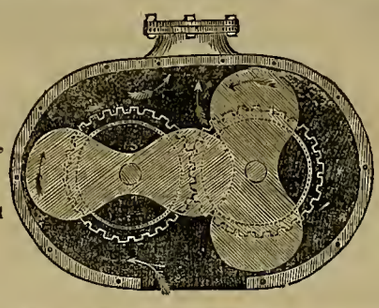
Our wholesale House, 628 Commercial street, extending through to 637 Clay street, San Francisco, contains always a most choice, and the largest, assortment in this State. Every Steamer brings the latest issued novelties from Europe and New York, which can be found at all the above stores, at moderate prices. 23v16-3m



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

THE OCCIDENTAL MINE at Virginia City, is reported to be one of the best mines in the country. The main tunnel is in about 900 feet, and connected with air shafts all through, so that it is a pleasnre for the miners to work; it furnishes enough rich ore to supply several mills. The company have commenced a tunnel 500 feet lower than the main tunnel, and intend to strike the ledge 1,100 feet below the upper works, and in this lower tunnel they are at work on an air shaft. They expect to reach the ledge in the lower tunnel by Christmas, and have three eight-hour shifts at work, day and night. The operations show very good management. They send 20 to 25 tons of ore every day to one mill, which pays for all expenses, they never having levied any assessments, notwithstanding their extensive operations. They are now sending their ore to Carpenter's mill at Dayton.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SUNNYSIDE HOMESTEAD ASSOCIATION.—San Francisco. Oct. 19th. Capital stock, $150,000; 60 shares, $250 each. Trustees: C. D. Carter, J. L. Blaikie, S. L. Keller and L. E. Bullock.

MUTUAL SAVINGS BUILDING AND LOAN SOCIETY.—San Francisco. Oct. 22d. Trustees: H. Rosekrans, J. N. Russ, Wm. B. Lake, Howard Chapman, Chas. Hansen, George W. Stevens and J. W. Wissinger.

ELECTION OF OFFICERS.—JULIA G. & S. M. Co.—Oct. 14th. Trustees, W. W. Palmer, J. C. Flood, H. A. Fox, Jno. Rule and N. Larco.

EXCHEQUER M. Co.—Oct. 17th. Trustees, S. Heydenfeldt, Jno. Sime, J. E. De la Montagnie, W. H. Sharp and A. K. Grim.

THE WONDERS OF NATURE AND ART can be studied to good advantage at Woodward's Gardens. Here are fruits, flowers, birds and animals of every description, from man to monkey. Books, pictures, statues, music, artificial lakes and fountains, together with many other things well worth a sight. *

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior presa, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

PACIFIC STATES AGENCY

FOR—

PATENT RIGHTS.

No. 418 Montgomery Street,

SAN FRANCISCO.

Patent Rights for the Pacific Coast, Eastern States, and Foreign Countries, bought and sold on Commission. Novel and patented articles for sale. Traveling Agents wanted to sell and introduce new inventions.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

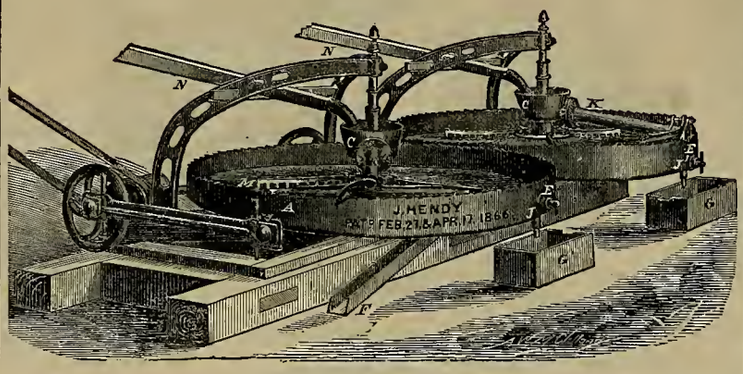
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p



PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.

A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

ESTABLISHED.....MAY, 1860.

Mining and Scientific Press

PATENT AGENCY.

DEWEY & CO.,

SOLICITORS OF

American and Foreign Patents,

414 Clay st., bet. Battery and Sansome,

SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-Issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

Consultation, by mail or otherwise, strictly confidential. Advice free.

There are many rejected applications lying dormant in the Patent Office at Washington from inventors on the Pacific Coast, for which, with able management, patents could be secured that would prove profitable to the inventors and a benefit to the public. Such cases we have taken up with good results, and are willing to make our fees for conducting them conditional on success.

Circulars containing information for inventors sent free.

The inventors of the Pacific Coast, of all others, should be careful to patronize only well known RESPONSIBLE agents.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street, below Sansome, San Francisco.

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIIth Volume. It has donned a new-style hat; or, i newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

MILLS FURNISHED AT SHORT NOTICE,

At the lowest Market Prices.

AMERICAN

(WALTHAM)

WATCHES,

THE BEST!

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the Imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of fluish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first-class dealers in the United States and British Provinces.

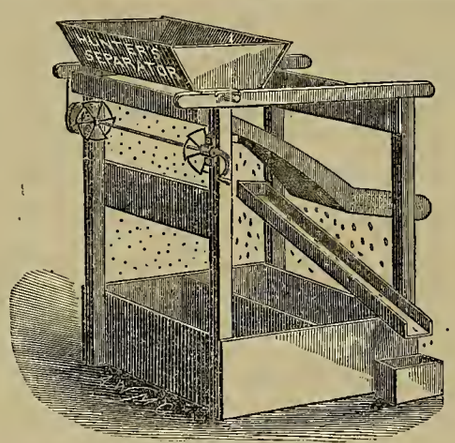
VOLUME XVII. Number 18.

Table of Contents.

Hunter's Grain Separator—Illustrated.
White Pine District.
Completion of Hunter's Point Dry Dock.
Metallic Deposits—Gold Nuggets.
Lecture on Chemical Geology
Artificial Crystallization of Gold.
Work at the Foundries.
Status of the California Geological Survey.
Our Great Workshops.
American Steamboats in So America.
Timber Rot.
Enterprises and Developments.
Mining in Sierra County.
Science and Religion.
Notices to Correspondents.
MECHANICAL MISCELLANY—The James-on Process; To Coal Iron with Copper; Test of a steam Boiler; Best Alloy for Engine Cocks; Platinized Mirrors
SCIENTIFIC MISCELLANY.—Denton on the Origin of Petroleum; Improved Purifier; The Ocean Bottom off the Atlantic Coast; Hydrogen as a Generator of Sound; Rhodaline.
ENGINEERING MISCELLANY.—N. Y. Society of Practical Engineering; Another Great Blast; Artesian Well in the Bay.
MINING SUMMARY—Comprising Late intelligence from the various counties and districts in California, Colorado, Dacotah, Idaho, Montana, Nevada, and Oregon. Stock Prices—Bid and Asked. New Incorporations.
San Francis o Mining Shareholders' Directory.
San Francisco Metal Market.
New Patents and Inventions.
San Francisco Market Rates.



Status of the California Geological Survey.

This State is fortunate in one respect regarding the character of the men who have been laboring in connection with the late State Geological Survey. While the Legislature of 1867–8, more virtuous and more enlightened than any of its predecessors (?), cut off Prof. Whitney abruptly at a stage when he had advanced about $15,000 of his own money in order to prevent the work in his hands from languishing along in a one-sided manner,—leaving him without prospect of recovering a cent thereof, so far as the votes and intentions of many of the members were concerned,—we now learn that the results of the survey are, after all, not to be thrown to the dogs, and that Prof. Whitney, and perhaps one or two of his assistants, are imbued with ambition and self-confidence enough to have determined to finish everything up creditably at all hazards, and at their own expense. This is what might have been expected, provided the persons who have been so engaged had been all men of fortune, and able to afford years of labor for the benefit of a thankless State. Some of the departments probably, however, will not be worked up; but Prof. Whitney himself, as we understand, has never ceased his labors connected with the survey, so far as the publication of the results is concerned. Four volumes in continuation of the Reports are now being printed, or are already partially printed, together with a number of useful maps. There is a second volume on Geology, one on Tertiary Fossils, one on Economical Geology, if we are not misinformed, and one on Zoölogy. Private inducements have secured the interest of a New York publishing house, to take the matter in hand solely as a commercial enterprise. At any rate we are to have the Reports, so far as the work has been done. A new edition of the fine map embracing thirty miles around San Francisco, will be brought into the market shortly. In the meantime, Mr. C. F. Hoffman, C. E., is in charge of the collection and apparatus of the survey, by appointment of the Governor.

It takes 100,000 ounces of silver a day, as estimated, to supply the demand for that metal in manufactures and the arts.

Dry Concentration—Hunter's Grain Separator.

Sorting of the grain independently of specific gravity, is just the half of concentration, whether it is wet or dry. It is an essential preliminary operation to the successful working of ores with water, in order to get anything like a nice and clean result. But concentration, it must be remembered, is not peculiar to mining. Its principles are in extensive operation in a great many of the arts and trades, under many interesting variations of circumstances. In some of these, the demands of business and manufactures have developed as rigid and searching an inquiry, by inventors, into the physical properties of the matter to be treated, as the necessities of gold and silver mining have been causing, and are still urging, relative to the ores of the precious metals.

HUNTER'S PATENT GRAIN SEPARATOR.

Hunter's Separator is nothing more than a sorting machine; but it appears to be a very simple, and a very effective one. It is adapted to the separation and cleaning of grain after a certain stage, as it is found usually when brought to the mills. The principle is that of vertical percussion, against an arrangement of sieves, combined with automatic feeding. The crank and wheels in the illustration explain the operation sufficiently. It differs from all other machines of the kind in a vertical vibratory movement being used, in place of the horizontal motion in use. The upper end of the chute rests on a cross-bar adjustable by set screws—giving any required blow to the chute; the lower end rests on an iron rod, arranged to change the elevation. The machinery used is cam or ratchet wheels that strike against the bottom of the chute. For the separation of barley from wheat, the vibration is scarcely perceptible, whilst the chess screens receive a sufficient blow to move the wheat up off the screen, and prevent the meshes from clogging. The hopper is arranged with feed rollers, which regulate the quantity of feed and distribute the grain evenly on the screen.

Mr. Hunter received the First Premiums at the following Fairs, held in 1868 : the Mechanics' Fair, San Francisco; San Joaquin Agricultural Fair, Stockton; the State Agricultural Fair, Sacramento; and the Santa Clara Valley Fair, at San Jose. Since the above premiums were awarded, the inventor has improved and simplified the Separator, by using one chute in place of two, and has reduced the price to the same as that of an ordinary fanning mill, while the power required is claimed to be less than one-tenth, and cleaner wheat is guaranteed by running once through than through the ordinary fanning mill ten times —which is certainly claiming a good deal. Persons interested or desirous of knowing whether these claims can be substantiated, will find the inventor at his place of business, southeast corner of Market and Beale streets, San Francisco.

SAN FRANCISCO REAL ESTATE REVIEW.—Messrs. Turnbull & Smith, printers, of No. 516 Sacramento street, issue to-day the first number of the *San Francisco Real Estate Review*, a semi-monthly sheet to be devoted to the interests of buyers and sellers in real estate, which is creditably gotten up typographically, and ably edited by Mr. Stetson, a young graduate of Harvard. The *Real Estate Review* proposes, among other matters, to give a record of all real estate transactions, compiled from official sources; a brief review of the business of the current week, with such comments thereon as may seem judicious; the offerings of large or small tracts of land worthy of special notice; and from time to time to note the erection of any costly public or private buildings,—in short to give a compendium of all matters pertaining to real estate.

NEW GAS LAMP.—A new lamp, of French invention, is thus described: Coal gas, intimately mixed with air, is urged with gentle pressure along a tube, and made to pass through a metallic plate pierced full of minute holes. By this means a vast number of jets are obtained, which, after being driven through a fine tissue of platinum wire, are lighted in the ordinary way. The platinum soon requires a white heat, and gives out so brilliant a light that it cannot be supported by the naked eye. About one meter of gas is consumed per hour.

FAIR AT THE MERCANTILE LIBRARY.—That most excellent institution, the San Francisco Mercantile Library, is having its own Fair, which is characteristic of the place, and of the people who frequent it. We have never known of a similar public institution where the librarians and everybody connected, from the earliest times, were so invariably gentlemen of a high order, and where the air of the place so invariably left a pleasant impression upon both transient and habitual visitor. On the walls at the head of the stairs, just before entering the newspaper room, will be seen two pictures which are very appropriate to the place, and expressive of the intelligent sense of the managers of the institution: the group representing Columbus and his party on the beach of San Salvador, and the pioneer family in the Sierra Nevada, overlooking Sacramento valley. There is a great deal of history and meaning in those two paintings, that will speak to every passer-by. In the museum there is now to be seen the best collection of paintings that the San Francisco public have had an opportunity to study for many a year—contributed for the Fair by private owners. The Fair having been interrupted by the earthquake, is to be reöpened on Tuesday, Nov. 4th.

THE STATE UNIVERSITY.—The temporary building for the State University, five miles from Oakland, is under way, and will be finished this year, or early next year; and the permanent stone University building is to be commenced next year.

Another meeting of the Board of Regents will be held next Tuesday. Propositions before the Board are kept rather quiet, naturally, by an understanding to that effect amongst the members. We have heard of several names that have been under consideration for professorships. It is believed that the Board will not altogether ignore, in their appointments, the principle of recognizing the meritorious labors and contributions to science, of individuals who have for some time been identified with the development of this coast; especially in view of the fact that we have, unquestionably, in that unappreciated class, some of the most worthy and able scientific men in the United States.

COMPLETION OF THE HUNTER'S POINT DRY DOCK.—Numerous items have appeared in the city papers, announcing the progress, and finally this week the completion of this important piece of work at Hunter's Point, under the direction of the civil engineer, Mr. A. W. von Schimdt. The space was blasted out of solid rock, and the work is not merely a success, but it has made Hunter's Point a locality to go sight-seeing; excursion steamers running thither on Sundays. The Ajax and other vessels have been in the dock for repairs. Some difficult submarine blasting had to be done during the progress of the work.

MINNESOTA claims to be growing 60,000 in population a year, of which two-thirds is by immigration.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Metallic Deposits--Gold Nuggets--Theory as to their Formation.

BY DR. LANSZWEERT.

Editors Press:—Since my publication on the above subject, in the Mining and Scientific Press of August 8th, 1868, I observe that there has been a discussion on the same at a recent meeting of the American Association for the Advancement of Science, (an extract of which was published in your paper of October 3d), corroborating my views; and before proceeding with the able remarks of Mr. Cosmos Newberry at the meeting on April 3d, 1868, of the Royal Society of Victoria, New South Wales, I cannot pass unnoticed the following sweeping assertion of Prof. Silliman, against the igneous theory of the origin of metallic veins. Dr. Blaney asked the Professor if it was supposed that the brilliant iron and copper pyrites found in veins are precipitated from solution? Prof. Silliman replied in the affirmative, and "thought *no one* could show any evidence of igneous origin in metallic veins. He had been a disciple of the igneous school, was brought up on it; but his convictions had been changed after much toil in the field."

At a *seance* of the Academy of Sciences of Paris, May 23d, 1864, M. F. de Marigny, of Algiers, presented specimens of *galena* and *copper pyrites*, crystallized and obtained artificially by the following methods: Galena, by a mixture of 300 parts of litharge, 60 parts of iron pyrites, 5 to 6 parts of starch, which were placed in a crucible and covered with a layer of pulverized glass of borax, to preserve it during fusion from contact of air. The crucible, closed with its cover, was placed in a furnace adapted for copper assays. After half an hour's high temperature, the materials being in perfect fusion, the crucible was taken out of the fire and left to cool slowly. By this operation, galena with large and brilliant facets was obtained. To produce galena in fine grains, known as *grains d' acier*, the same mixture as above was used, and a difference of crystallization obtained by the sudden cooling of the fused materials in dipping the red hot buttons of the crucible into water.

By melting a mixture of litharge and iron pyrites, which were previously partially roasted, beautifully crystallized galena was obtained.

Peacock copper ore *(cuivre pyriteux panache)* was made by melting together 20 parts of iron pyrites, 45 parts of copper turnings, and 20 parts of sulphur, in small pieces; observing the same precautions as for galena.

From the results of these experiments, and the natural facts observed for centuries in mines, the object of M. Marigny's communication was to show, 1st, that the metalliferous beds *(gites)* owe their origin to the influence of high temperature emanating from vast subterranean fires; 2d, that the metals and metalloids are brought up in the state of gaseous emanations, which are principally condensed in *terrians anciens*, fissured by the upheavings of the plutonic rocks.

In connection with the above, does one not obtain pyromorphite or polychrome in melting in a porcelain crucible a mixture of 1 part of fused phosphate of soda and 7 parts of chloride of lead, cooling slowly the mass treated, and decanting the part still liquid from the crystals?

And of the Washoe excitement reminiscences, were those beautiful crystallized samples of the once famed Bailey ore, not due to igneous origin, as their aspect not only puzzled our scientists, but truly burnt the pockets of many San Franciscans?

The antimonial silver Bailey ore was obtained by melting 46.5 parts of sulphide of silver, with 22 parts of black sulphide of antimony, in a crucible covered with a layer of salt; the arsenical ore by melting 23 parts of sulphide of silver, and 7.5 parts of yellow sulphide of arsenic, or 40.5 parts of powdered silver, 12 parts of sulphur, and 9.4 parts of arsenic.

Leaving aside for the present the igneous theory, the following is an abstract of the arguments used against the denudation theory, and in favor of what seems to some a rather ludicrous idea—the growth of nuggets in the drifts (veins.) Prof. Bischoff, the eminent chemical geologist, remarks: "That some portion of the gold found in auriferous veins has been derived from the quartz lodes at the same time that the veins themselves were formed, there can be no doubt. But the very marked difference between much of the alluvial gold and the vein gold, tends to make us believe that this portion of it had some other origin, or was transferred from the *reefs* to the *drifts* by some means other than denudation. And when we consider that the nuggety gold consists of nearly the heaviest known matter, offering but a small surface of attack when compared to the other constituents of the veins, it appears strange that they should be found at a great distance from any known *reefs*, as nearly all the large nuggets have been. Some of them are found in the sand overlying the gravel, which is quite inexplicable—remembering their weight, and the otherwise regular arrangement of the deposit from the surface downwards—first clay, then sand, and fine and coarse gravel. These objections to the denudation theory are not easily explained away; added to which is the fact that gold is contained in the iron pyrites found in the veins, assuming the form of root and branches of trees, and also replacing and impregnating the carbonaceous matter of the drift wood. This proves that gold did exist in the meteoric waters which circulated through the veins and deposited iron pyrites at a comparatively recent date. Based upon these arguments, Mr. Selwyn advanced the hypothesis that nuggets may be formed (Mining and Scientific Press, Aug. 8, 1868), and that particles of gold may increase in size through the deposition of metallic gold from the meteoric waters percolating the veins, which waters, during the time of our extensive basaltic eruptions, must have been of a thermal and probably of a highly saline character, favorable to their carrying gold in solution."

As Mr. Ulrich points out, in his essay on the mineralogy of Victoria, this view of the character of the meteoric water in earlier times receives proof from the fact that, on the western gold fields only, where tremendous basaltic eruptions have taken place, all the large nuggets have been found; while on the eastern and northern fields, where basaltic rocks are wanting or of very limited extent, the gold is usually fine and nuggets above an ounce or two in weight very rare. That gold does exist in solution in some saline waters at the present day, has been proven by analysis, and Mr. Daintree, I believe, found gold in solution in water taken from a mine. Further proof of gold having been in solution at a comparatively recent date, I found when examining the pebbles of the miocene veins. These rounded quartz pebbles are often coated over and cemented together by brown iron ore, in which I found gold, while I never could discover any in the pebbles themselves. What that gold salt was, whether a chloride, silicate or sulphide, we have no means at present of ascertaining, and as it may have been in the same solution that deposits the pyrites which probably contained the iron in the form of proto-carbonate with sulphates, it was not easy at first to imagine any ordinary salt of gold existing in the same solution as a proto-salt of iron; but this I find can be accomplished with very dilute solutions, in the presence of an alkaline carbonate, and a large excess of carbonic acid, both of which are common constituents of mineral waters, especially in Victoria. This is true of chloride of gold, and if the sulphide is required in solution, it is only necessary to charge the solution with an excess of sulphureted hydrogen. In this manner both sulphides may be retained in the same solution, depositing gradually with the escape of the carbonic acid.

[To be continued.]

The young women of Paris are about to enjoy the privileges of the Sorbonne—a college for poor students, founded in the twelfth century by Robert de Sorbonne. Nearly three hundred ladies attend the lectures—a method of instruction admirably adapted for women.

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

[Continued from page 258.]

Many of the outbursts of plutonic rocks which, as described, had thus disturbed the sedimentary strata, are accompanied, at the same time, by mineral veins or lodes, which most frequently are found traversing the strata in the vicinity of such disturbances, and would, therefore, appear to be intimately connected with these outbursts or intrusions. The minerals contained in such lodes are also observed to vary according to the nature of the eruptive rock which appears to have caused their formation.

The solid matters injected into the strata and brought up by these eruptions, whether poured out over the land or into the water, would ultimately, by their disintegration and decomposition, yield up some of their constituents in a more or less soluble form, as part of the alkalies, lime, magnesia, etc. This process will explain how some portion, for example, of the lime requisite for keeping up the supply of that earth in the ocean for the assimilation of organisms, which continually abstract it from the same, can be accounted for.

In like manner, since these eruptions are considered to have had most features in common with volcanoes, it is inferred that they also would have been accompanied by great volumes of vapors and gases, amongst which, as in the case of the active volcanoes of the present day, the products of the oxidation of sulphur would have been prominent, and by their subsequent reactions assist in accounting for the large quantity of sulphates known to exist in the ocean.

Many deposits of sulphates, chlorides, and other compounds, such as gypsum, rock-salt, caruallite, etc., have no doubt resulted from the evaporation of lagoons or arms of the sea, cut off from the ocean by movements such as the elevation of the line of coast, etc.

The rocks formed on the solidification of the molten matter brought up by these outbursts or intrusions, which, as before mentioned, have disturbed the sedimentary beds from the oldest period up to the present day, possess a common general physical structure and arrangement, but otherwise are not all of one character, since they differ very considerably in *chemical* and mineral constitution, according to the geological epoch of their appearance in the crust of the earth.

Unfortunately, however, the attention of geologists has been but extremely little directed to this subject, and consequently trustworthy data as to the geological occurrence and mineral contents of such rocks are at present far from being sufficiently numerous or exact to allow of a decided conclusion being arrived at by their study. The result of a prolonged inquiry led me some time ago to announce the probability that—

1.—Eruptive or intrusive rocks of identical mineral constitution have made their appearance or intrusion into the earth's crust at similar geological epochs.

2.—That the minerals, or classes of minerals, accompanying or associated with such rocks may serve as a means of distinguishing the several eruptions in geological chronology.

3.—When the geological epochs of the appearance of two or more intrusive or eruptive rocks are known to differ, these rocks will then also be found to differ essentially in mineral constitution.

As far as I have yet been able to obtain trustworthy data, these views have been confirmed, but the evidence is as yet far too imperfect to put these forward as proved, although I indulge in the belief that further researches will show them to be correct.

The chemical analyses of eruptive rocks show, in the first place, that they may be divided into two general classes of acid and basic rocks; but when the geological age of the appearance of these rocks is inquired into, it is found that we encounter both acid and basic rocks which have made their appearance at all periods.

Just as in the oldest periods we find acid granites which correspond to the acid trachytes of the modern volcanoes, so in the oldest times also we find more basic norites, dolerites, etc., the equivalents of the more basic lavas and dolerites of the volcanoes of the present day; and although the facts collected are at present not sufficiently numerous to decide this point conclusively, it would appear probable that the acid eruptive rock characteristic of each geological period was accompanied by, or connected in some way with, the contemporaneous eruption also of a more basic rock equally characteristic of this same period.

Believing as I do that the origin of all these eruptive rocks may be ascribed to causes similar to those producing the active volcanoes now seen on our globe, it naturally brings us now to the consideration of such volcanic action.

As I have before explained, when considering the solidification of the globe, I contended that there then existed, and still exists in the interior of the earth, some great reservoir or reservoirs of fluid igneous matter, from which source all the igneous rocks, from the oldest to the most recent, have been derived, and I regard this probable for two reasons: first, because when the torrents of molten lava covering vast extents of country are seen issuing from a volcano, it is naturally inferred that it must come from some receptacle in the earth below; and, secondly, that as we know that considerable areas of the solid crust of our sphere have at times been depressed or sunk down to great depths, it appears equally natural to conclude that this could not have happened if the globe was entirely solid, and that there consequently must be some great hollow or chamber below filled either with gas or liquid matter, which, by its mobility, would make room for the mass thus depressed.

Whether, however, there may be only one or more reservoirs, and whether there may be, as some have imagined, two distinct reservoirs, containing respectively acid and basic, or trachytic and pyroxenic silicates, or whether both acid and basic silicates may not have been derived from the same source, I do not venture to decide; but I am inclined to believe that the sources of volcanic matter must have some intimate connection with one another, since it is known that volcanic rocks taken from any part of the world, no matter how far distant from one another, from Iceland or Terra del Fuego, from Ætna or Java, are identical in mineral and chemical constitution, and in their physical and optical properties.

That volcanic action is something more than the mere local outbursts which have been compared to insignificant pimples on the face of the globe, is proved by a mere glance at a map showing their geographical extent and distribution. The innumerable volcanic islands of the Pacific Ocean, for example, extending from longitude 80° W., some 50° of equatorial longitude further westwards to the coast of Asia, present one continuous scene of recent and present volcanic activity, extending in length over more than one-eighth of the equatorial or greatest circumference of the globe.

The hypothesis that volcanic, granitic, and other plutonic rocks, are all local products resulting from masses of ordinary sedimentary strata melted up by being depressed into the body of the earth, so as to come within the action of the earth's central heat, has to encounter the difficulty of explaining how these masses could be let down deep into the substance of a solid globe in which no vacuity is supposed to exist; then it is requisite to know why, if the earth's central heat at a certain depth is considered sufficient to melt up these strata when so depressed, the entire substance of the earth at that depth is not in a molten state. Both the chemist and geologist will also, I think, hesitate before believing that rocks which we know are of such definite and constant mineralogical and chemical constitution wherever they are encountered in nature, could be formed by the melting up of mere mechanical aggregates of rock *debris* whose composition is known to vary to the widest possible extremes.

Knowing, for example, that limestones, often in immense beds are found in all sedimentary formations, it appears difficult to imagine that a granite, felsite, or other plutonic rock, specially characterized by containing only traces of lime, but much alkali, could be formed by the depression and melting up of such strata. In like manner, it appears equally difficult to suppose a basic dolerite, containing but comparatively little silica, formed from the melting up of other formations specially characterized by an enormous thickness of sandstones and highly silicious beds. In practice it would be difficult to select any piece or portion of the sedimentary formation we are acquainted with on the earth's surface likely to possess a mean chemical surface composition which would, when melted together, give the percentage composition of a granite, diorite, dolerite, or other such rock.

[Concluded next week.]

Farms in Arkansas sell at from three to five cents an acre. A local paper says dirt is so cheap that "you have to look sharp, or they will smuggle an extra forty acres or so on you in making out the deed."

Mechanical.

The Jameson Process.

J. Jameson's process for making wrought iron blooms direct from the ore,—which was last year tested at the iron beds on the Ringgold estate in Pennsylvania, and demonstrated to be a success so complete as to warrant the supplanting of the old works by a new and complete establishment on a large scale,—is thus described by a correspondent of the *Pottsville Standard*, in a letter dated Sept. 10th :

The three furnaces, each with two fires, are constructed at a cost of about $1,200, and each are capable of producing ten tons of blooms per week. They are somewhat of an oven shape, having, however, a stack from the top of about twenty feet in hight. A refining fire is in front, into which the blast pipes enter on the side. The gas that is evolved from the fuel passes into a chamber, where combustion takes place, and thence the combustion of the gases continues till above the fifth chamber it passes (together with such deleterious qualities as have been taken up from the ore in its progress) through and out of the stack. The five chambers are called in the Jameson Patents the deoxidizing chambers. The ores are calcined, then crushed, and first placed in the top or fifth chamber. Into the first and second chambers a small jet of steam is injected whereby hydrogen is generated for the purpose of aiding in desulphurizing and dephosphorizing the ores. The floor of the top chamber is a table made of fire clay blocks, with an opening at the end opposite from the door or entrance through which the raw ore is thrown in. On this table the ore is spread out, and after being here subjected to the operation of the burning gases it is then pushed down through the opening at the end of the table opposite to the door on to a like table in the chamber below, where it is again spread out, and here it remains for a time and in like manner passes on to the table of the third chamber; there, after undergoing a like operation, it is passed to the second chamber, thence it goes to the bottom or first chamber. Thus every particle of the ore is equally operated upon. By this time the ore is almost a pulp, and then it is passed into the charcoal bed and refining chamber. Here the loop is soon formed, when it is taken out, and the hammer soon presents you with a bloom of from 225 to 250 pounds in weight. It is not claimed that to make wrought iron direct from the ore has anything new about it. Probably half the blooms made in America are thus produced. Generally, they are of an inferior quality, and involve a large expenditure of fuel and of ore. It is not so, however, with the blooms made by the Jameson process. It is claimed that a ton of blooms can be made by this process with about the same expenditure of fuel and ore that it requires to make a ton of pig metal in the blast furnace. The experience at Ringgold shows that 200 bushels of good charcoal and about 2½ tons of 50 per cent. ore will yield a ton of blooms. The production is stated to be unfailingly uniform. A company has been formed with a capital of $200,000, called the "Ringgold Iron Company." The works are now in full operation, and produce thirty tons of blooms per week.

To Coat Iron with Copper without a Battery. — The objects are first well cleaned, and then painted over with a solution of protochloride of tin, and immediately afterwards with an ammoniacal solution of sulphate of copper. The layer of copper thus produced adheres so firmly to the iron or steel that the different objects can be rubbed and polished with fine chalk without injuring the deposit. The tin solution is prepared with 1 part of crystallized chloride of tin, 2 parts of water, and 2 parts of hydrochloric acid. The copper solution, with 1 part sulphate of copper, 16 parts of water, and ammonia sufficient to re-dissolve the precipitate formed when it is added. Zinc and galvanized iron can be treated, directly by the copper solution, without using the tin salt. This process, due to Herr Graeger, is described in a recent number of Dr. Boettger's *Polytechnisches Notizblatt.*

An omnibus drawn by steam power, and carrying thirty-five persons, has been successfully tried on a common road in France.

Platinized Mirrors.—M. Dodé takes an ordinary plate of glass, and by a chemically mechanical operation coats it upon one side with an almost infinitely thin layer of platinum. By this plan he obtains a mirror with direct reflection, and which may also, curiously enough, be employed as a common window pane by turning the coated surface outside. A slight tinge is imparted to the objects beheld through this medium, but otherwise the vision is clear, and the outlines of the objects well defined. One of the distinguishing features characterizing the light transmitted by glasses platinized in the manner described, is its peculiar softness and tone. M. Leroux was the first to notice this particular attribute of the light, and stated that it might be turned to good service in shielding the vision when engaged in regarding any intense source of heat, such as the sun, smelting, or gas furnaces.—*Mechanics' Magazine.*

Interesting Test of a Steel Boiler.—The Pittsburg *Chronicle* gives an account of some experiments made August 23d and 25th, upon a steel boiler at the Fort Pitt Boiler Works in that city. It was a cylinder boiler without flues, and made entirely, even to the bolts, of No. 3 homogeneous steel, made at the Black Diamond Steel Works. The plates are full quarter inch thick, and the heads three-fourths inch; its length is five feet eight inches, and its diameter thirty-eight inches. The trial on the 23d was made in presence of the Government inspectors, and a large number of boilermakers, steamboat men, mechanics and others. A small hydraulic pump, the same as is used in testing iron boilers, was employed. Everything was in readiness when the hour fixed upon had arrived, the boiler had been heated, the pump attached, and the intention was to put on pressure enough to burst the boiler, if possible. As the gauge approached 600 pounds the gasket or leaden joint by which the man-hole is stopped, began to leak freely, and water also spurted in the form of spray from the seams, until it was found impossible to maintain the pressure. The circumference of the boiler was now found to have increased an inch and a quarter by the stretching of the plates. The leaks mentioned having been partially stopped, three more trials were made, thus more severely testing the boiler by their repetition. By the last of these a pressure of 665 pounds was reached without producing any further effect than to cause the boiler to swell still more, until it increased two and a half inches in circumference. There were no signs of the plates giving way at the rivet holes, where they are necessarily weaker than at any other part, the whole strain being thrown upon the part remaining between the holes. Heretofore no boiler has ever stood a greater pressure than 538 pounds, and that was a boiler expressly prepared for the test. On the 25th, the boiler was again tested by hydrostatic pressure, and on the tenth trial it withstood a pressure of *seven hundred and twenty-five pounds* to the square inch, when, in consequence of the giving way of one of the stay bolts, further experiments had to be abandoned for the present. As on the previous occasion a large number of manufacturers and others were present, and took great interest in the trial. The boiler stretched three-eighths of an inch during the last test, in all it has stretched two and seventh-eighths inches. Some think that had sufficient force been brought to bear on the first trial the boiler would have withstood a pressure of 1,200 pounds to the square inch. No boiler has ever before been known to withstand so high a pressure as the one tried on these occasions. The experiments are of the utmost importance.

Best Alloy for Engine Cocks, etc.—We extract the following from a paper upon metallic alloys contributed by Prof. H. Dussance to the *American Artisan:* The best alloy for the cocks of an engine is composed of copper 88, tin 8, zinc 4. Too much zinc diminishes its tenacity; but it is wrong not to add a small quantity; its affinity for copper is such that, as soon as introduced, it draws the molecules together and disengages from them a large quantity of scoria, which ascends to the surface, and which is removed before pouring. It is used also by the melter to ascertain the temperature of the melted metal, and is, moreover, useful to stir the bath, for being volatile it is disengaged all the time in bubbles.

Those parts of the engine subjected to friction, are composed of copper 81, tin 17, zinc 2. For the eccentrics the quantity of tin is diminished by 2 per cent., so as to avoid breaking. These alloys being rather dry and brittle, require a great precision in the adjustment.

Scientific Miscellany.

Denton on the Origin of Petroleum.

Prof. Denton says that petroleum is not a *coal* oil, but a *coral* oil. Among his arguments in support of this theory, are the following: It is rarely met with in a coal district. Not even a *smell* of it has Prof. D. perceived in any of the coal mines which he has visited. If it is from coal, it should never be found in rocks older than the coal measures. The contrary is true. "In this country nearly all the oil hitherto obtained has been from beds that lie below the coal measures, and sometimes at a great depth below them. On Oil Creek, in Pennsylvania, it is found by boring in shales and sandstones, sometimes to a depth of a thousand feet; those beds belonging to the Chemung group of the Devonian formation, and many hundred feet below the coal measures. At Enniskillen, in Canada West, where the oil has at one time come up in springs, and overflowed, leaving a thick bed of asphaltum covering the ground for an acre, the limestone in which borings are made contains characteristic fossils of the Hamilton group of the Devonian formation. The oil wells in Western Kentucky, and in some parts of Tennessee, are in the Trenton limestone,—that is, in the lower Silurian formation. The same oil floats on the surface of a limestone quarry near Chicago, the limestone belonging to the Niagara group of the Silurian formation; showing conclusively that it has no necessary connection with coal."

The immense quantity of free oil forbids the belief that it could have been produced from sea plants. It would require large subterranean lakes of it, to pour out the thousands of barrels which some wells have daily yielded. The sea-weeds of the Silurian and Devonian times contained so little bituminous matter that their impressions do not even darken the light-colored shales in which they are found.

Against the theory that it has been distilled from bituminous shales, may be said, that for this strong heat is required; and generally, where it is found in greatest abundance, there is the least appearance of igneous action.

Prof. D. has in his possession numerous specimens of fossil coral from Devonian and Silurian rocks, the honeycomb cells of which are filled with this oil. He has seen the same from different parts of the country. We quote a portion of his conclusion: "I have found it repeatedly in these corals, and in no other part of the rock, invariably accompanying the corals, and never connected with any other fossil; these corals frequently in the center of limestone blocks. Reefs of such coral would furnish oil in quantities sufficient to account for the immense deposits that have been discovered. Preserved by them in compact bodies, the oil taking up at least half the space of the coral reef, we can readily suppose, that when the cells were crushed by the superincumbent weight of rock, or during upheavals and subsidences, cavities and crevices in the earth's interior would be filled by it. It is, then, an animal production, and not a vegetable one."

Assimilation of Oxygen by Night and Day.—Dr. Pettenkoffer, of Munich, has exploded the doctrine that in sleep the lungs take up less oxygen than in waking hours. He finds that in sleep the lungs absorb twice as much oxygen by night as by day, and give off but 42 per cent. of carbonic acid against 58 per cent. by day. The excess of oxygen is, he says, stored up for use in daylight exercise.

More Meteorites.—The Museum of the Academy of Sciences in Philadelphia is now receiving eight large meteoric stones, weighing together 3,000 lbs., discovered in the Mexican mountains by Dr. H. B. Butcher, of that city.

Improved Polarizer.—The *Journal of the Franklin Institute* for September, has a letter from the Abbé Moigno, in which he describes the apparatus known as the polarizer of Nuremberg, as recently improved by M. Hempel. In its present form it consists of, 1st, a blackened glass, placed ordinarily horizontal, or more or less inclined at will, on which the incident ray is polarized by reflection. 2. A disk or ring, placed so as to support, on the path of the reflected polarized ray, the transparent plate which is to show the chromatic polarization. 3. A convex lens, which renders the ray, proceeding from the transparent plate, either parallel or convergent. 4. A new contrivance, which gives to the instrument an unexpected success, a parallel mirror of glass silvered on its exterior surface, fixed at such an angle, on a support, that it brings up to a vertical line the ray, doubly reflected and transmitted, and sends it into a Nicol's prism, which serves as an analyzer, and turns on an axis. Whatever be the action exerted by this second mirror, all we can say is, that the phenomena of chromatic polarization, seen in this new instrument, are presented with incomparable intensity, and sharpness of outline. For example, a model of a butterfly, formed of thin plates of selenite, of different thicknesses, presents by turning the analyzer, not only the two complementary colors red and green, orange and blue, yellow and violet, of well known polarizers, but all the shades of the spectrum, which succeed one another, with incredible clearness and brilliancy.

The Ocean Bottom off the Atlantic Coast.—L. F. Pourtales, of the U. S. Coast Survey, who dredged along the course of of the Gulf Stream, found the bottom for four or five miles northeasterly from Florida, made up of common coral sand with very scanty traces of life. The next area, from 90 to 300 fathoms, is a rocky floor made of a very hard limestone, derived from living shells. Life was abundant. The third area was the regular and common ocean bottom, from two hundred and fifty to 300 fathoms covered with the chalky remains of foraminifera. He also dredged the bottom of the ocean off the coast, and found, first, extending from the north of Florida to Montauk Point, near Block Island, R. I., a bottom of silicious sand, perhaps a hundred miles wide. Outside of it was a calcareous bottom, occupying the whole area south of Georgia. Between the two, off the Carolinas, is a limited deposit of green sand, containing the foraminifera.

Hydrogen as a Conductor of Sound.—Prof. Tyndall made use of the following experiment to illustrate the low conducting power of hydrogen for sound: A bell struck by clock-work was placed under the receiver of an air pump, and the air exhausted as perfectly as possible. By applying the ear close to the glass a faint sound could still be heard. The exhausted receiver was then filled with hydrogen, when the bell was again heard to sound, but faintly. On pumping out the hydrogen all trace of sound ceased, even when the ear was placed close to the receiver. Hydrogen being about fifteen times lighter than air, it might be supposed that its low conducting power arose from its tenuity. But such is not the case; the conducting power of air, rarefied fifteen fold, and therefore of the same density, exceeds that of hydrogen in a marked degree.

Flowers and Plants of the Rocky Mountains.—Over sixty different varieties have been described by Dr. Scovell in the vicinity of Central City, Colorado; seventeen of which were not heretofore described in the botanies. There are still, according to Dr. S., hundreds of new varieties to be described. The flowers of the Rocky Mountains are varied and beautiful. Almost every botanical family is represented. Some of the new species will have to be arranged under new genera and families.

Rheadine.—A new alkaloid has been discovered by Hesse, to which he gives the above name. It exists in opium and in the red poppy. It is soluble in alcohol, ether and water, crystallizing from the ether in white prisms. Bichloride of mercury gives a white amorphous precipitate, ammonia precipitates it in white crystalline flocculi, chloride of gold gives a yellow precipitate, and it is decomposed into gold by strong acids, giving a purple solution.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING OCTOBER 6TH, 1868.

82,676.—IMPROVED NOZZLE FOR HOSE PIPE. Oscar J. Backus, San Francisco, Cal.:

I claim the combination with a nozzle, throwing a single stream of water, the sprinkler D, constructed and operated with the holes E, F, G, G, in the stop-cock and holes C, C, leading into the nozzle chamber, substautially as and for the purpose specified.

This is a neat little arrangement, more especially intended for irrigating hose, such as are in use about houses and gardens, where a sprinkler and a nozzle throwing a solid stream are used. In the ordinary nozzle there are at least two caps or eduction pipes, and they must of course he changed whenever a different jet is required. Aside from this trouble, their liability to loss is a frequent source of vexation, and a desire for something better has resulted in this invention. The pipe is constructed with the usual wide mouth and sprinkler cap which connects with a chamber in the enlarged part, and this chamber receives its supply of water through the holes at some distance apart which connect with the main pipe by means of similar holes in the key of the stop-cock. For the single jet, a pipe passes directly through the center of the sprinkler chamber and pierces the cap so as to just appear beyond the surface. This pipe connects with the main portion of the pipe by a single opening through the key made at right angles with the two first mentioned and between them so that when the single jet is opened, the sprinkler will be closed; and when the key is turned sufficiently to open the sprinkler the single jet will be closed. By turning a little further the cock will, by its peculiar construction, be entirely closed. The whole device is neat and presents an attractive appearance.

82,696.—IMPROVED LINIMENT FOR RHEUMATISM.—A. M. Dennen, Folsom City, Cal.:

I claim the medical compound, substantially as herein described.

82,726.—IMPROVEMENT IN CARRIAGE SPRING. Josiah R. Locke, San Francisco, Cal.:

1. I claim the box J, elastic packing or spring K, and the extension braces or rods L, L, attached to the side spring g, g, substantially as and for the purpose specified.

2. The combination of the side springs g, g, with the C-spring I, by the shackle connection H, the C-springs extending around the axle bed and attached to the reaches, substantially as described.

3. The springs E, E, crossing the upper ends of the springs g, g, and passing over the bolster and attached to the forward ends of the outside reaches, substantially as described.

This invention is one of the many which have been made during the last few years, all of which tend to improve the comfort and general appearance of buggies and carriages. Among the many arrangements and combinations of wood springs, this is deserving of notice. It consists of four side springs which cross each other, the front springs being attached to the carriage bed, back of the center, and the rear springs in front. The front springs are continued, so as to bend around the bolster, and fasten to reaches beneath. The rear springs were connected by shackles to C-springs on the rear axle bed. The middle reach is formed so as to receive a rubber spring just back of the bolster. Two rods are carried back diagonally from this spring, and are fastened to the rear end of the side springs, so that as the springs operate and tend to separate the axles, the rubber will be compressed, and acting in connection with the side springs, it forms a very easy riding carriage.

82,727.—IMPROVEMENT IN CARRIAGE SPRING. Josiah R. Locke, San Francisco, Cal.:

1. I claim in combination with the wood and steel springs A, A, the gooseneck springs D, D, constructed substantially as described.

2. The double acting springs F, F, and the slides E, E, in which the lower ends move, or equivalent device, the whole constructed to operate substantially as described.

This invention varies from the one just described in having a curved steel spring in combination with the wood in each of the side springs. The steel curves around the bolster in front and the rear axle bed, behind fastening below. Instead of crossing in this invention, a thin steel spring is fastened to the wooden portion and bent backward, forming a sort of gooseneck curve, the end being fastened to the body. Double-acting springs are attached to the body and curve, so as to extend down along the back of the wooden springs where they pass through a slide which allows them some motion, and when the carriage is heavily loaded, they relieve the main springs.

82,745.—IMPROVED QUICKSILVER FEEDER FOR QUARTZ MILLS.—John Pattison, Nevada, Cal.:

1. I claim the quicksilver fountain C, with the vertical pipe D and F, above and below the horizontal shaft, substantially as described.

2. The cup G′, in the horizontal shaft E, graduated by the set-screws G, or their equivalents, substantially as and for the purpose described.

3. Coupling the shaft E, together by the slotted ring H, and keys H,′ H,′ and operating the machine by the lever K, pawl K′, and toothed wheel J, the whole constructed and arranged to operate substantially as described.

This invention is designed to supersede the irregular method of feeding quicksilver by hand to the batteries in quartz mills, which practice is attended with unfavorable results, from the fact that too little may be fed, or too much,—either extreme entailing loss. The device consists of a fountain containing quicksilver, having a pipe or passage from the lower part, extending to the battery. A shaft passes directly across this passage, so as to close it entirely. This shaft has a chamber extending partly across its diameter, so that when the shaft turns, this chamber is brought into a position which allows it to fill with quicksilver from the pipe. As the shaft continues to turn, the chamber will be reversed, and thus empty its contents into the lower part of the pipe through which it passes to the battery, the passage remaining closed to all but what is contained in the chamber. The shaft may be revolved by a ratchet, and the size of the chamber varied to suit circumstances.

82,778.—IMPROVEMENT IN BUTTONS.—Frederick Wittram, San Francisco, Cal.:

1. I claim a button or stud having an opening in its fastening disk or plate, closed by a movable segment or piece, substantially as shown and described.

2. In combination therewith a closing or retaining spring, substantially as set forth.

82,787.—IMPROVEMENT IN PROPELLING APPARATUS.—E. S. Barnes, Nehraska City, Nehraska:

1. I claim the cogged sectors C, C′, in combination with the paddle D, when arranged and operated substantially as set forth.

2. The combination of the reversing sectors E, E′, and their operating lever E, when acting to operate the bar C, and their operating lever E, when acting to operate the bar C, and rack c, for feathering the paddles at either end of stroke and reserving the same substantially as set forth.

82,790. — IMPROVEMENT IN BUSHING FOR WHEELS.—Thomas Blake, Stockton, Cal.:

I claim the bushing C, provided with the cylindrical bore D, and having its external surface polygonal as and for the purpose described.

82,859.—IMPROVEMENT IN PREVENTING INCRUSTATION IN STEAM BOILERS.—Hugh McQuaid, Canyon City, Oregon:

I claim the application in steam boilers of an amalgamated surface to the parts, liable to incrustation, the iron plated with copper being coated with quicksilver, and being a liquid, on the surface of the copper expands as herein set forth, rising for that purpose, the aforesaid metals or any other substantially the same, which will produce the intended effect.

82,896.—IMPROVEMENT IN GRAIN HARVESTERS.—Medders Vanderpool, Polk County, Oregon:

1. I claim the arrangement of the spiral screw A, with the right head-board of the concave 20, whereby the standing grain is conducted to said head-board without being pulled from the ground, as herein shown and described

2. The combination of the obliquely ribbed drums O, ribbed concaves 20, and spiked drums 2, 2, substantially as described and for the purpose specified.

3. So constructing and arranging the rod D, D, provided with tapering spurs that the standing straw is forced to the rear to deposit the threshed grain upon the bed x, before said straw is drawn out of the machine, substantially as herein shown and described.

4. The combination of the ribbed drum O, O, spurred wheels 2, 2, ribbed concaves 20, and troughs 40, substantially as described for the purpose specified.

ISSUED FOR THE WEEK ENDING OCTOBER 13TH, 1868.

82,963. — IMPROVEMENT IN AGRICULTURAL LOCOMOTIVE WITH SPADING APPARATUS: Conrad Locher, Oroville, Cal.:

1. I claim the application of equalizing gears between the axles of a wagon, so that in turning a curve each wheel adopts the speed which the curve requires, and receive their propelling motion from the engines, by means of gearing or its equivalent.

2. The gearing and connection through the king bolts.

3. The spaders so constructed that they enter the soil like a pick, (nearly vertical) cut off a slice like a spade, and turn it over like a plow.

4. Turning the spaders in the same direction as the wagon, thereby assisting locomotion.

5. I claim the combination of the whole in the way and manner herein set forth.

82,966.—IMPROVED CAR COUPLING.—Samuel Madden, Eureka South, Cal.:

I claim the above described combination and arrangement of devices to form an automatic car coupling, consisting of the sliding bumper E, with the slots G and G′, opening J, and spring F, the pin I, with collars H and H′, and the guiding plate K, with or without the rollers D, at the end of the link, substantially as specified.

The frequency of fatal accidents which occur in coupling and uncoupling railroad cars, has led to the invention of many self-couplers, and the present is one of the devices for that purpose. It consists of the ordinary bumper, which holds the link, and through which the pin passes. Above this is a secondary sliding bumper, which is kept forward by a spring. The coupling pin passes through a stationary support above the sliding bumper and down through slots in the same. The pin has a shoulder, which when it is raised, rests on the edges of the slot at the top of the sliding bumper, and is thus held up. When two cars come together, the link from one car enters the mouth of the stationary bumper, and the contact of the two cars presses the sliding bumper back till it has reached a point which allows the shoulder on the pin to drop through an enlarged space at the end of the slot, and the lower end of the pin is thus allowed to pass through the link holding it fast. In a later improvement, a small recess or projection in the lower part of the sliding bumper catches the shoulder on the pin, and prevents the bumper from moving forward again till the pin is withdrawn.

83,123. — IMPROVEMENT IN PISTON ROD PACKING.—Orrin Collier, Sacramento, Cal., assignor to Self & Erva B. Silliman, of same place.

1. I claim the metal rings *a*, and *b*, as constructed, so that they both have about the same amount of surface bearing against the rod, and both about the same amount of surface bearing against the face of the gland, whereby the two shall wear equally, substantially as described.

2. The construction of the packing with reference to the stuffing box, whereby a free space is left around the rings so as to allow them to move freely with the rod if it should not work perfectly true.

This invention is designed to give a simple and efficient packing for piston rods, or propeller shafts, the packing being acted on by the vapor, air, water, or other pressure. The stuffing box is formed in the ordinary manner, with the exception, that instead of entering the cage, the body of the glands projects outward, supports the rod, and at the same time carries an oil cup. Within the cage are three or more cylindrical segments fitting around the shaft or piston, and having another series surrounding them and breaking joints, the whole being kept in position by an elastic ring or band. The segments are faced to fit the inner end of the gland perfectly tight, and are kept in position when not under pressure by a spiral spring within the cage. Two small openings connect the interior of the cage with the source of pressure, as the cylinder in an engine or pump, so that the greater the pressure, the closer the rings are forced against the rod and inner face of the gland.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

TARRED AND UNTARRED ROPE.—It is only when rope is to be subjected to frequent changes from wet to dry, that its durability is increased by tarring. It is really weakened by the process. In the experiments of M. Du Hamel, at Rochefort (France), in 1741, it was found that an inch rope of the best Riga hemp in its ordinary or white condition broke with a weight of 4,500 pounds, while a tarred rope of the same size and character gave way to a strain of only 3,400 pounds. From numerous tests made by the same experimenter it was decided that the white or untarred cordage when in continual service, under circumstances where it was not subject to moisture, would last one-third longer than the tarred, and that its strength diminished much less rapidly when stored in magazines or storehouses.

AN OREGON PATENT WASHING MACHINE. The *Oregonian* speaks of the advantages of a new washing machine invented and patented by Mr. Dixon, of Forest Grove, as follows: "In the first place, it is cheaper by a considerable than any of the other machines—costing only $18, while the "Economy," for instance, costs about $40. Its cheapness places it within the reach of almost every family, however poor. It works somewhat on the plan of the "Economy;" but the double head to which the levers are attached, is a skeleton which allows the water to pass through, thus avoiding its resisting force, and rendering the working of the levers much easier. One of the best evidences of the value of the machine is the fact that the inventor, who was a poor man, has already sold rights enough to place him in comparatively independent circumstances."

A WRECKING COMPANY, consisting of a number of well trained wreckers, under the direction of skilled and experienced men, is suggested by the *Bulletin*, for the purpose of promptly coming to the rescue and saving of unfortunate vessels like the Brignardello, Viscata, Autocrat, and Oliver Cutts; by the wrecking of which $250,000 to $300,000 was lost to the commerce of the port.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

PACIFIC DREDGING COMPANY.—Oct. 28th. San Francisco. Capital stock, $600,000; 6,000 shares, $100 each. Trustees: Lloyd Tevis, Charles J. Brenham and James Pollock.

PACIFIC PROTECTIVE ASSOCIATION.—Oct. 28th. San Francisco. Capital stock, not stated. Trustees: Benj. F. Freeman, Geo. H. Russell, Samuel A. Raymond, Wright Leroy and James A. Pritchard.

"THE SPIRITUAL LIGHT" is the name of a new monthly paper just started in this city, the title of which indicates its specialty. Its editor and publisher, Geo. G. W. Morgan, recently from Washington City, we judge from personal acquaintance to be a gentleman of candor and intellectual attainments.

THE LATEST NOVELTY.—Mr. Woodward has fitted up a large circular boat 150 feet in circumference for the use of visitors to his gardens. It accommodates about 100 persons at a time, is propelled both by oars and self-adjusting sails, and moves around the circuit "like a thing of life."

MANY YEARS AGO the writer of this notice and an invalid physician, while visiting the Island of St. Croix for their health, experienced and witnessed many surprising and beneficial effects of the rum there produced upon many of the invalids, who were, like ourselves, seeking health, and upon inquiry and investigation, obtained a full history of its medicinal virtues. He was delighted and surprised, and determined to make it the basis of a *Tonic and Restorative Medicine*. The result of his labors was a glorious success for himself and suffering humanity, for the celebrated PLANTATION BITTERS was thus made known to the world, being an article of real merit founded on new principles, and relying wholly upon the vegetable world for its medicinal effects, worked a rapid revolution in the history of medicine. *

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, October 31, 1868.

Financial.

Our local money market is characterized at present by considerable stringency. The requirements have been large for legitimate purposes, and the storage of so great an amount of grain has kept foreign capital out of our market, which was not the case at this date last year. Rates are 1@1½ per cent. per month; exceptional transactions at 1½ per cent.

The steamer Sacramento, which sailed for Panama on the 22d of October, took away another half million of dollars on Government account, making no less than $8,000,000 shipped by the Sub-Treasurer, so far this year, being $2,300,000 more than was shipped by that officer in all of 1867.

September returns from the parent mint in Philadelphia give the following exhibit: Gold coinage, $79,010; silver coinage, five bars, $187; nickel, $75,250; copper, $10,800—total, $165,248 in round numbers. The coinage of the San Francisco Branch Mint for the same month was $2,455,000, all in gold and silver; making a difference in value of $2,289,752 in favor of the San Francisco establishment. This comparison holds good with any other month in the year, and one year after another; yet the building in which all this valuable and important work is done in this city is a miserable old barrack—cramped, without even ordinary ventilation, and hardly fit for a storehouse, while the Philadelphia concern is almost palatial and perfect in all its appointments. From this coast is procured the great mass of gold and silver, to the regular receipt of which the whole country is indebted for its financial prosperity. Whatever Congress concedes to this portion of the Union is given most grudgingly; but whatever tends to build up and extend the interests of Eastern cities is bestowed with lavish hand. Even our harbor is suffered to remain obstructed with dangerous rocks which could be removed with little expense compared to the benefit their destruction would entail. Party politics would have granted a large sum for erecting a Branch Mint at the Dalles, where probably not over $40,000 worth of bullion can be raked together in a year; but when an appropriation is asked for the real and pressing requirements of this coast our representatives plead in vain. The time is not far distant when our increased population will entitle us to a proportionably increased representation in the halls of Congress, and when the great commercial importance of the Pacific States will compel Eastern members to do us justice.

City Stocks.

We report a somewhat improved market for miscellaneous stocks; however, the sales in the open market cannot be taken as a criterion for the extent of the transactions in these securities. Reported sales in the Board have been as follows during the past week: 200 shares Spring Valley Water, $66@65 50; 30 shares Pacific Insurance, $124; San Francisco Gas, $77@76; 40 shares North Beach and Mission Railroad, $69 per share.

The Pacific Bank will disburse its usual monthly dividend on the 12th November. The first annual meeting of the stockholders of the Peoples' Insurance Co. is announced to be held on the afternoon of the 3d of November.

The morning open session, by action of the Board, has been discontinued from and after the 28th instant, the regular sessions continuing as heretofore.

Mining Share Market.

The mining share market, since Saturday last, has been apathetic and less firm, so far as a few leading shares were concerned, but other stocks were quite active, and for the most part well sustained. The number of stocks which changed hands was greater than the previous week, but the aggregate sales were not so large if we take into consideration the interruption of business generally by the earthquake on the 21st instant. The bulk of the transactions are at present made by the "insiders," while the "outsiders" are less disposed to enter the market, the attention of the latter being somewhat diverted by the nearness of the Presidential election. At the close a general decline took place.

IMPERIAL—opened at $113, declined to $107, rose to $115, and closed at $101. The Imperial-Empire shaft has attained a depth of 125 feet below the 900 level. In the main drift from the 900 level, they have passed through the clay, the face of the drift being in decomposed quartz and porphyry. The drift out of winze from the 750 level of the Alta mine has been carried 60 feet westward, and is now west of the point where they had ore on the 700 level. This drift is in barren quartz. At present they hoist about 145 tons of ore per day. The receipts of bullion to the 27th instant for the current month foot up $29,567, against $34,390 same time in September.

SAVAGE—has been remarkably active, and this remark may be applied to transactions for a month past. The sales during the period under review will aggregate nearly 10,000 shares, gradually declining from $93 on last Saturday to $74 yesterday morning, and closing in the afternoon at $74 50. For reasons heretofore stated we are precluded from giving information concerning the present condition of the mine.

HALE & NORCROSS—sold at $48 50@45, then at $46 50, and closed at $45. The timbers for the fourth station—930 feet, new shaft—which corresponds with the seventh station of the Savage mine, were set on the 26th of October, and it is thought they will soon commence drifting. No new developments in other portions of the mine.

CROWN POINT—declined from $46 25 to $44, and closed at $43. By advices to the 28th we learn that fifty feet above the 900 level track floor, the drift had been carried north 28 feet from the south winze, and is said to have from four to five feet of mill ore in its face. The cross-cut in the winze developed about seven feet of fair ore, but in drifting north or south from it the pay streak grows narrower. The floor directly above, where the cross-cut was made, shows some six feet of ore, but on going south from this point grows poorer; while on the other hand, the drift north is reported to show decided improvement in quality if not in quantity. From the South winze they have gone forty-two feet south, running in fair looking quartz, but have not as yet found any pay ore. The shaft is twenty-one feet in depth below the 1,000 level, carrying hard blasting rock. About $20,000 in bullion has been received so far for October account.

KENTUCK—receded from $282 50 to $270, and closed at $263. The receipts for October account to the 26th foot up $45,368.....GOLD HILL QUARTZ was in the market at $55@50. On the 26th instant, $1,964 70 were sent forward.

GOULD & CURRY—sold at $95@89. The Bonner shaft is now 1,136 feet in depth. The clay in which they work is very troublesome, but latterly some porphyry has made its appearance in the southwest corner of the shaft, which, if it continues, will make it favorable to start a drift.

CHOLLAR-POTOSI—declined from $149 to $139, and closed at $136 50. During the week ending on the 23d of October, 1,162 tons of ore were extracted, all coming from the new Blue Wing stope and the croppings above it. The northeast drift is 328 feet in length and the incline 382 feet; face of drift in hard porphyry.....OPHIR ruled at $20@19. The new shaft has attained a depth of 510 feet.

OVERMAN—sold very regularly during the past week, ranging from $78 to $82 50, yesterday morning declining to $76, and closing at $71 50. The stopes in the different levels are reported to look well. They employ three reduction mills. On the 27th of October $6,792 in bullion was dispatched to the office in this city.

ALPHA—declined from $44 50 to $39 per share. Latest advices state that the east drift from the 940 level continues in dark porphyry, containing many threads of white quartz. No change in the south drift or cross-cut, the ground being hard in all the drifts.

AMADOR—came into the market more freely than for a long time past, dropping from $230 to $195, improving to $210, and closing at $207. The condition of this mine is reported to be as heretofore, the decline being the result of sharp "operations."

Reports from what is known as the White Pine district indicate an almost fabulous extent of mineral wealth in that region. It is located one hundred and thirty miles south of Austin, Nevada, and is represented to be very elevated, something like four or five thousand feet above the level of the sea. We have been informed by an intelligent gentleman and practical miner, just from Austin, that a day or two before he left, two wagons arrived from White Pine, loaded with bullion. One contained twenty-three bars of silver averaging eleven hundred ounces each bar, and the other had six thousand pounds of silver bullion. The leading mines at present are the Keystone, Eberhardt, and another, the name of which escaped his memory. These are located at Treasure Hill, where the ore is found in a limestone deposit. Our informant saw one piece of ore weighing eighty pounds, which yielded $800 worth of silver. Upon being struck with a hammer the face of the ore was indented precisely as if the blow had been given to a bar of silver. Sixteen hundred pounds of ore returned $4 to the pound, equal to $6,400 for the sixteen hundred pounds. There were over fifteen hundred men at White Pine, but many of them were returning to pass the winter, which is reported to be very severe in that place. Provisions and all sorts of accommodations were difficult to be had, but he feels certain that there will be a rush that way in the spring. Since obtaining the above information, we have received the Virginia *Enterprise*, which gives the following corroboratory intelligence:

Judge Pitzer, who has for some time been out in White Pine preaching democracy, returned to this city day before yesterday. He says the mines of that region are the richest he has ever seen—ten times as rich as was the Comstock lead in its best days. His idea of the deposit in that district is that it resembles a bed of coal, as, for the distance of a mile in length by over half a mile in width no shaft has been sunk but has penetrated the rich ore. Towards the top of the hill upon which the mines are situated the cap of limestone overlying the ore is quite thin, but in descending shafts must be sunk to a much greater depth to reach the ore deposit. The depth of the deposit is unknown. The ore rapidly increases in richness in sinking into the vein, and in the deepest shaft it is so rich and tough that it is very hard to sink in it. A pick leaves a hole in the ore such as would be left in a mass of lead by a blow with the same tool. There can hardly be found in the lead any kind of ore that is worth less than $500 per ton; in fact, the whole deposit is "fearfully and wonderfully" rich. The Judge thinks the stories of the coldness of the winters in the district exaggerations. As cattle live through the winter without barn feed within two miles of the mines, he is satisfied that it is little if any colder than here.

As hardly any freight can be got over the Central Pacific Railroad, the Nevada and Grass Valley merchants are ordering by way of Marysville.

THE Oakland *News* says a considerable part of the real estate of that city is held by women.

THE best place to get every different variety of spectacles found in the market is at C. Muller's, 205 Montgomery street. *

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

ESTABLISHED.....MAY, 1860.

Mining and Scientific Press

PATENT AGENCY.

DEWEY & CO.,

SOLICITORS OF

American and Foreign Patents,

414 Clay st., bet. Battery and Sansome,

SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-Issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

Consultation, by mail or otherwise, strictly confidential. Advice free.

There are many rejected applications lying dormant in the Patent Office at Washington from inventors on the Pacific Coast, for which, although management, patents could be secured that would prove profitable to the inventors and a benefit to the public. Such cases we have taken up with good results, and are willing to make our fees for conducting them conditional on success.

Circulars containing information for inventors sent free.

The inventors of the Pacific Coast, of all others, should be careful to patronize only well known RESPONSIBLE agents.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street, below Sansome, San Francisco.

DITCH LAW.—The Supreme Court has just decided that Zellerbach & Co's title to the Eureka Lake ditch property is not valid, and that it is to revert to Martin & Co.; the legal point involved being that the transfer of the ditches by the Eureka Lake to the Lake Water Company was illegal, because the payment in stock was made to the stockholders and not to the company.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Calaveras County.

Mokelumne Hill *Chronicle*, Oct. 24th: We were shown, on Sunday last, by Mr. Schlund, of our town, a "chispa," which weighed nine ounces. Those who think our mines are "petering" out, should take a look at the dust which is brought to town for sale, to say nothing about the chunks of amalgam.

The Rich Gulch correspondent writes: The Palomo mine is being worked from three shafts; the north and south shafts are being sunk by contract, while rock is being taken from a level from the center shaft to keep the mill running in the day time.

Alexander & Co. are steadily pursuing the even tenor of their way, the shaft going deeper and deeper every day. They are making extensive preparations for winter; the hillside is literally covered with timbers, so that when the roads get bad they will not be troubled.

Lee & Reed, in the old Norton claim, are expecting to strike the ledge of quartz every day. The indications are they can not be many feet from it.

Mariposa County.

Mail, Oct. 23d: Robt. Nelson, and Jas. Nelson, while working on a quartz vein, near the town of Hornitos, and formerly known as the Kellett vein, struck upon a pocket of ore exceeding in richness anything before found in that vicinity. It is estimated that they have bagged from $25,000 to $40,000, perhaps more.

Nevada County.

Gazette, Oct. 20th: H. H. Sweet, who is engaged in quartz mining in the Eureka district, informs us that the prospects in that district are extremely flattering. A crushing from Sweet's mine is now being made at Palmer's mill, which is expected to yield from $60 to $70 a ton. A crushing of 75 or 80 tons from the Banbury ledge, made at Black & Young's mill, was cleaned up a few days ago, and yielded $4,000. A new claim, supposed to be on the extension of the Banbury ledge, is now being opened, and is yielding as rich ore as was ever seen in the district.

Oct. 24th: The new mill of the Coe Co., was started in operation on Thursday. The mill has 10 stamps of 800 lbs. each, and there is sufficient steam power to put in any additional number that the yield of the mine in the future may require.

Grass Valley *Union*, Oct. 22d: Because we give but few mining items, let no one suppose that in this vicinity the miners are not active. The difficulty is that millmen and mine owners will not consent for us to give big returns for crushings now being made.

The Coe mill was started up yesterday. The following description is given of the mill and mine: The mine is now down 265 feet. They have a fine four-foot ledge, and have just commenced taking out rock from the second level, which is 250 feet beneath the surface. The quartz is of an excellent quality, and improves as they advance towards the west. The rock is of the same appearance as that of the Eureka, and particularly resembles it in the character of its sulphurets. They are in fact a telluret of gold, containing much less iron than the ordinary sulphurets, being of much less specific gravity, and are so soft as to be easily cut with the knife. No other vein, with the exception of the Eureka, contains this kind of sulphurets, and their presence is said to be an infallible indication of richness. The rock looks exceedingly well, many pieces showing free gold. There is very little water in the mine. A fine 35-horse-power engine does the hoisting and pumping. The battery consists of ten stamps, and all machinery for crushing and saving the gold is arranged in a very neat and substantial manner. The amalgamating is done in the batteries. For separating the sulphurets, four of Hungerford's improved concentrators are used. This contrivance has never been employed in this section before, but has been used in some of the lower counties with great success. It is claimed that 95 per cent. of the sulphurets will be saved. About 50 yards east of the Coe mine is the Aspinwall ledge, owned by the same company, and very similar in the character of its rock to the Coe and to the Eureka. They have a good two-foot ledge, on which they are now down 90 feet. The rock has paid from the start; that from the first 45 feet yielding at the rate of $15, and the remainder $30 per ton.

Oct. 24th: Better rock is being taken out of the Inkerman mine than ever before. The ledge is about 18 inches wide, and in ground easily worked. The next crushing will be in a few days, and 50 loads are to be put through, which good judges say will pay $20 per ton. The location of the Inkerman is near that of the celebrated North Star mine.

The new machinery for the Banner mine will be delayed in putting up for two weeks the molds in which it was to have been cast being thrown down by the earthquake.

Excelsior.—*Transcript*, Oct. 21st: The Mohawk and Montreal mine, after a run of seven days and a half, are cleaning up. A correspondent says: "I believe they are going to show you that there is really gold here, and in immense quantities." The Independence, Green Emigrant, and other mines are doing first rate, and the district has brighter days ahead.

The Mohawk and Montreal Co., Meadow Lake, in seven days and 20 hours, crushed 100 tons of rock, which averaged $30 to the ton. The ore was of different grades as follows: 25 tons of first grade, 50 tons of second grade, and 25 tons that was crushed to get it out of the way.

Virginia *Enterprise*, Oct. 20th: We yesterday saw at the assay office of Conrad Wiegand & Co., a fine gold bar from the Mohawk and Montreal mine, Excelsior district, California. The gold was brought to this city for melting and assay on Saturday evening last by Mr. C. J. Collins, who is one of the principal owners in the mine. The weight of the bar after melting and assay, is 221 ozs., and its value $3,524.49, but $48.60 of which is silver. The amount of ore crushed was 100 tons, and the time occupied in crushing was 7 days and 22 hours. The crushing was done under the disadvantage of running only in the day time, thus making it necessary to fire up anew every morning, by which much time was lost. The mill is now inclosed so that lights can be kept burning, and the mill will hereafter run day and night. The company have in sight between 1,000 and 2,000 tons of ore of the same quality as that crushed, and expect every week to send in a gold brick equal in value to this, their first one.

Placer County.

Truckee *Tribune*, Oct. 24th: We learn that the Baker Bros., at Dutch Flat, are busily engaged in getting a cement mill in readiness upon their claim. Should the mill prove a success, quite an impetus would be given to mining in that section, and it would again become a flourishing and thrifty community.

Sacramento County.

Folsom *Telegraph*, Oct. 24th: A well-known mining claim at Willow Spring Hill, regularly, at the end of the month, pays to its owners a clear dividend of $2,000 each.

Sierra County.

Downieville *Messenger*, Oct. 24th: Rock has been discovered in tunnel of the Gold Bluff Co., which pays $400 per ton.

The Forest City correspondent writes: The Young America tunnel on Young America Flat, formerly called Saw Mill Flat, has been run into the hill about 2,000 ft. The rock is soft, six men are employed. This tunnel is dry and pays very well for the hands that are being worked.

Ellery & DeMerritt's gravel claims on Young America Flat, are adjoining Dobbin's claims. The tunnel here is 1,000 feet in length. The rock is soft, and the ground is paying well.

Mr. Webb is still knocking away at his claims below the Gen. Grant.

Further down the creek on Chaparral Flat, are some gravel diggings, more generally known as the Gregg and Wade claims. These are reported as not paying very largely at present. If the tunnel here was lower, the reverse would be the case. The tunnel is about 500 ft. in length. The rock pitches into the hill downward into the water, so that it cannot be worked until a drain has been made, which it is intended to commence in a few days.

Toll's diggings, opposite Chaparral Flat, are paying well. A new tunnel is being run in here, and good pay taken out.

Tuolumne County.

A correspondent of the Sonora *Democrat* of Oct. 27th, is very urgent that the water rates be reduced, so that the miners can afford to work their claims. He says: A reduction of the water rates would certainly promote business in all branches as it would be an inducement for many that are now idle to go to work, while the working of the placer mines as it is to-day is kept in check by the water companies.

COLORADO.

Central City *Herald*, Oct. 7th: Mr. Brastow started up his new mill yesterday, for the first time.... Dr. Beatchley is making a trial run to-day on a new pan, which is partly the work of his own genius. The design is to amalgamate gold and silver ores, either with or without roasting. He claims that this pan possesses advantages over any other ever tried here before.... Mr. Owens, of the Pleasant Valley Co., sent down yesterday, and shipped through Warren Hussey & Co., 100 ounces of gulch gold. This is the product of a two week's run, working only a day gang of hands. The nights have become so cold that he has drawn off the night hands; and is now running the claims in day time only.... The Smith & Parmalee G. M. Co. are preparing to erect a new stamp mill on the site of the old one.... Col. Tannett has two very large sized and fine looking specimens of Bates ore lying in front of his office, at Black Hawk. He has a large force of hands employed erecting his new stamp mill at Mountain City.

Ore from the Apache lode yields $483.41 silver per ton.

In James Creek, the Topeka Co., of Boston, are vigorously at work tunneling on the Buckskin vein. They have passed the bottom of the first shaft and are below the second, taking out a large quantity of extra fine ore, which is being saved for the New Boston machinery.

Central City *Register*, Oct. 8th: Woodbury & Co. have the old Peregrine mill fitted up in good shape, and are running it on custom ore.

About 770 stamps are now crushing ore in Gilpin County.

They are getting out very fine looking galena in the First National tunnel. It contains about 15 ounces of silver.

Wright, Bennett & Co's bar claim at Idaho, opened out again last week, better than ever. On Saturday, three men took out over eight ounces, and the whole yield of the week, three men working, was 20½ ounces.

The bar claims generally, that are being worked below Idaho, are paying better than at any previous time this season. Griswold, Falladen & Co's claims, as well as Fitzpatrick's, Goult's, Raeder's, Schwartz & Mixer's, and several others are paying much more than wages all the time.

The gold and silver shipments for the month of September, from this city, foot up larger than during any single month for several years. The shipments by express, of gold and silver bullion, foot up $175,000, and at least $25,000 more have gone by private hands. To this is to be added $50,000 in silver ore, which has been shipped from Georgetown, and the matte shipped by Prof. Hill, which will make the total product very little, if any, short of $300,000, for the month, from Clear Creek and Gilpin counties.

Disbrow & Harkins, of the Conqueror lode, Empire district, have now, after passing through 75 feet of cap, with occasional pockets of good ore, struck a solid body of ore 3½ feet in width, which will pay fully $300 per cord in a stamp mill. Mason, Ball & Munson are at work with good results on the Teutb Legion, crushing mostly surface ores.

DACOTAH.

The local paper gives the following: In a government return of gold sent to Denver by Mr. W. C. Ervin, of Sweetwater, the dust brings $17.79 per ounce in coin, amounting at the present rates here, to $24.90. This, for battery dust, is extraordinary, and shows what may be expected from the Sweetwater country.

IDAHO.

Lewiston *Journal*, Oct. 3d: Neither of the arastras in Warren's were at work while we were there. The Bemis had stopped on account of a slight injury to the machinery, but probably is grinding as usual by this time. The Lock & Long was at that time adding new and more efficient parts to the works.

Ball & Whitman will have their arastra completed about the 10th of this month. They each have ore on hand and near by ready for reduction.

E. K. Patterson, agent for the Southar Mining Co., shipped from here to the Davis lode, near Florence, the Miners' mill which will be erected there.

The Davis lode is one of the best in North Idaho.

There is on hand at the Pioneer mill at Warren's, ready for crushing six or eight tons of rock from the Charity lode, which is very rich.

Owyhee *Avalanche*, Oct. 17th: Work continues on the Forest. The lode is reported from 10 to 12 ft. wide—rich in silver. Mr. Perry informs us that it is his intention soon to commence work on the Mayflower, a large lode eight or nine miles from Silver.

All the machinery for the Rising Star mill will be on the ground in a week. A portion of it has already arrived.

The editor has visited several of the mines. He says of the Ida Elmore: Everywhere can be seen evidence of the vast richness which has given this mine its world-wide notoriety. The lode varies from 18 inches to three feet in width. In many places we noticed the gold sparkling in the light of the candle, and several pieces of the ore, which we broke off, were completely speckled with the shining stuff. The mine is well timbered. A contract for sinking the main shaft 100 ft. deeper has been let to Dan Monroe, who has already commenced work. About 500 ft. from the mouth of the tunnel another shaft has been commenced and will be sunk to a depth of 100 ft. Between the two shafts, when completed, there will be ready for stoping a rich body of ore, 600 ft. in length and 100 ft. deep. During the next few months the ore will be taken from the upper portion of the mine and run out of the main tunnel. A fine dump ground is being prepared and a road leading thereto is being built.

He says of the Golden Chariot: The richest ore ever found in the mine is now taken from the stopes in the 140-ft. level south of the shaft. The lode is about three feet in width and contains not only considerable silver, but gold in surprising quantities, plainly visible in the dim candle light. The Golden Chariot, and in fact the whole range, taking in the Ida Elmore, Oro Fino, and extensions thereof, is the richest and most extensive deposit of gold-bearing quartz in the known world. The Upper Sinker mill continues working the ore.

The postmaster at Placerville writes to the Boise *Democrat* of Oct. 14th, as follows: This place is very quiet, but little mining being done. Miners are busily engaged fixing telegraphs and other constructions for hydraulic mining next spring, when we expect a lively time compared with the past season.

NEVADA.

Humboldt.

Unionville *Register*, Oct. 17th: The new mill company broke ground on yesterday morning for the foundation of its new mill.

Fall & Co. shipped this week, per Wells, Fargo & Co's Express, 2,300 ounces of fine bullion.

Same of Oct. 26th: Fall & Co. shipped this week, per Wells, Fargo & Co's Express, 2,500 ounces of fine bullion.

The Monroe Series Mine, in Sierra district, has passed into new hands, and is now under the control of Mr. Smythe, as local managing agent. It is his intention to push work with renewed vigor. He has now several men employed taking out ore, which pays a handsome profit above the cost of mining and milling.

W. H. Davis, managing agent for the Seminole mine, owned in New York, commenced work yesterday on the company's mine.

Winnemucca *Argent*, Oct. 22d: Atchison's mill has made a small clean-up, for a starter, of eight tons of refuse ore from Fox & McBeth's claims on the Little Giant ledge. The result was about $50 per ton. A tunnel 135 feet, striking the vein over 100 feet below the surface, shows it 2½ feet wide and rich enough to work $250 per ton.

The Golconda mine embraces 2,000 feet. Webb & White own one-half and the Star City Mining Co., of New York, the other half. The mill is also owned by the same parties. T. G. Negus, Supt. of the New York Co's interest, informs us that Webb & White have offered to give $60,000 for the other half of the property, or take that sum for their half, or segregate interests.

Reese River.

Reese River *Reveille*, Oct. 16th: Eight tons of ore from the Stonewall and Little Rose mine, located on Chloride Flat, near Treasure City, in the district of White Pine, were recently worked at the Manhattan mill in this place, and gave a yield of $450 per ton.

Oct. 17th: The South American mine, on Lander Hill, is reported to be producing a larger amount of good milling ore than ever before. The first class is of superior quality, and yields upwards of $200 per ton. The South American is one of the largest veins yet developed in Lander Hill, and wideus to five or six feet, although the most valuable ore is generally obtained from the narrower points in the vein.

Oct. 20th: There is a report in this city of discoveries of rich ledges at a point called Duckwater, about 30 miles south of the district of White Pine, in the same range of mountains. The ore is said to be exceedingly rich, and of a similar character to the fine chlorides of White Pine.

Nine bars of bullion, of the average fineness of .971, and valued at $12,458.58, were brought into this city yesterday from the Monte Cristo mill in the district of White Pine. The bars were assayed by David Lundbom, of this city.

We learn from John W. Beard, who arrived in this city from the Tuscarora district, that his 5-stamp mill would be run-

ning next week. About 50 tons of ore have been extracted from tho Beard ledge, which is estimated to yield from $50 to $100 of gold per ton. Three men, named Thomas Williams, Isaac Wells and George Taylor, had dug a ditch 1¼ miles long to bring water from McCann Gulch into Gardner Gulch, where the dirt is estimated to pay from $5 to $15 per day to the hand. Gardiner Gulch is some half a mile long and 200 feet wide, and tho pay dirt is about 13 feet deep.

Oct. 21st: David Lundbom received today for assaying 2,461 ounces of bullion from the mill of the old Dominion Co., in the district of Hot Creek.

The Virginia mine, in White Pine district, is apparently a vein, and has been traced the distance of 160 feet in a north and south direction. It has been opened by n perpendicular excavation, which is about 20 feet square for the depth of 15 feet and 4 feet in diameter for the depth of 10 feet, making a total depth from the surface of 25 feet. In making this excavation, the vein, or body of ore, was exposed to the great width of 18 feet, and how much wider it may prove remains to be determined by fuller development. The ore is highly colored by lead and copper, and exhibits the peculiar and beautiful stetefeldtite. Twelve tons of the ore have been worked—six tons at the Manhattan mill in this city, and six tons at the Centenary mill in the district of Newark—which gave an average yield of $230 of silver per ton. About 30 tons of a similar quality of ore have been taken out of the mine, and lie upon the dump, waiting for the completion of the mill at Hamilton. The Virginia mine is 600 feet long, and the body of ore is so extensive that its owners believe it may be easily opened so as to regularly supply the mill with all it can reduce. The mine is so happily situated that it may be reached during all seasons of the year.

Virginia *Enterprise*, Oct. 25th: There is no getting around it, the White Pine mines are rich—wonderfully rich. All the letters received here from there, and all the men who come in from there, tell the same story. Parties who have examined the mines say that they are doubtless the richest ever discovered in any part of the world. Mr. Wm. Woodburn, of this city, who spent some days in the mines, says he believes there is enough silver in the one small range of mountains in which the White Pine mines are situated to pay off the National debt—large as it is. His account of the nature of the silver deposit agrees with that of all others who have visited the mines, namely: that it appears to be a vast stratum of limestone, as wherever shafts have been sunk through this limestone cap the rich ore has been found. In some places the rich ore has been forced up to the surface through crevices, while in others shafts must be sunk to the depth of from 10 to 30 feet before the ore is found. The depth of the deposit is not known, no shaft having been cut through it. The Eberhart Co., the oldest in the district, have drifted in one direction a distance of 180 feet, with cross shafts 60 to 70 feet in length, and all in a solid mass of ore worth from $200 to $20,000 per foot. On Chloride Flat, on the same mountain, the same kind of ore has been found by every shaft that has passed through the limestone. All the miners who have "struck ile" have piled about their shafts large heaps of ore; ranging in value from $200 per ton up to the frightful figures we have ventured to mention above. We might make out a long list of the lucky ones, but as it might create an inconvenient excitement among their poor relations, we refrain. It is enough to say that men who were about our streets four months since without a cent are now worth so much silver that neither they nor any of their friends can calculate its value.

Washoe.

Virginia *Enterprise*, Oct. 21st: The 100-pound chunk of black sulphuret ore taken from the 850-foot level of the Yellow Jacket mine, a few days since, is now on exhibition in a glass case at the Bank Exchange Saloon, Gold Hill. An assay of it, just made by Bousfield & Co. of this city, shows that a ton of the same would yield, silver, $3,676.53; gold, $1,783.61; total, $5,460.14.

Oct. 24th: Twenty stamps are kept running day and night at the Sierra Nevada works, upon ore taken out from an immense surface deposit just above the mill. It is mined very cheaply, as there is nothing to be done but pick down the ore, shovel it into cars and run it to the mill. The ore which they are now at work upon is a vast deposit of broken quartz and decomposed vein matter, which appears to have been at some time subjected to the action of water, as the heavier matter lies upon the bottom and the whole is disposed in strata, as are the gravel banks of the placer mines of California, though in a manner less marked. It would seem that the waters of Cedar Ravine once flowed along the side of the mountain, cutting into it until a vast slide was caused, which filled up and changed the course of the ravine, throwing it off to the southward. Mr. Apple, the Supt., showed us a piece of quartz weighing about eight pounds, and with all its angles perfectly sharp, which his workmen found some 40 feet below the surface, and which must have come from a ledge a short distance above, that was full of native gold, some of it very coarse. Many such pieces have been found in the vicinity during the past six or eight years, but as yet the ledge from which they came has never been found.

The total shipment of bullion from this city and Gold Hill during the past week, by Wells, Fargo & Co's, and the Pacific Union Express companies, was 6,412 lbs., worth $227,117.12.

The Yellow Jacket mine is looking exceedingly well. The rich body on the 810-foot level, mentioned by us heretofore, is now fully five feet in width, and of unknown extent in all directions. It is too rich to be worked by the common mill process, and is being shipped to Dall's mill, Washoe Valley, for reduction by the Freiberg plan.

Oct. 25th: Parties are now engaged in putting up machinery in the old Hale & Norcross hoisting works, for the purpose of working out ground left in some of the upper levels of the mine.

Oct. 27th: A blower will soon be put in operation at the Bullion works for forcing fresh air to the bottom of the main shaft, now 1,200 feet in depth.

Gold Hill *News*, Oct. 23d: There was shipped from Wells, Fargo & Co's Gold Hill office this morning, seven sacks of bullion, weighing 575 pounds, and of the value of $14,463.

MONTANA.

Helena *Post*, Oct. 16th: Under the heading of "Another Cypher," this paper says: "That most practically interesting of all papers, the Mining and Scientific Press of San Francisco, which the *Post* takes pride in furnishing with about a column of Montana news each week, contains in its issue of the 26th ult., the following: 'Great activity prevails at present at Unionville. The daily yield of the Whitlatch & Sensenderfer, Hodge, Ricker & Turnley mills is not less than $300.' We reproduce it for the of suggesting to the Press that another cypher is needed there. The run is $3,000 per day, not $300.

We accept the explanation and make the correction. It was a typographical error. We can say for the *Post* that its strict attention to local interests, renders it one of our most valued exchanges, and enables us to give Montana that credit which it deserves as a mining country.—[Eds. Press.

Day before yesterday Prof. Steitz at the First National Bank Assay Office, manufactured four gold bricks, weighing in the aggregate 1,110 ozs., and worth $20,200 in coin.

The Virginia *Democrat* says: At Sterling, Hall & Spaulding have started their mill and Mr. Hobart has a mill in course of construction....There is an excitement about Ramshorn Gulch.

The John How tunnel at Summit is now 500 ft. long. Mr. R. Laude, of Leesburg, reports that though but little has been accomplished in the Salmon River mines this year, owing to the scarcity of water in the gulches; yet all unite in expressing their convictions, that this locality is the center of as fine a placer mining district as the Territory contains ...C. B. Houser & Co. are mining in Davis' district, on Jefferson River. A "current wheel" is used, which raises 150 inches of water 34 feet, and by means of which the miners are making $10 per day to the hand. The diggings are from 12 to 15 feet in depth, pay from the grass roots to bedrock, and will give employment to hundreds of men for years to come. Blake & Ellison are bringing a ditch from the Boulder, which, when completed, will furnish about 500 inches of water to claims inaccessible by the raising process.

OREGON.

Dalles *Mountaineer*, Oct. 16th: By the arrival of Lockwood & Edgar's stage last evening, we learn that Canyon still continues quiet, without much excitement of any kind. The new mines on being prospected, are found to be deep, but very rich, and the future hopes of the citizens are greatly elated on account of this rich discovery. It has been quite cold there for some days past, and everybody is preparing for winter. The prospecting parties have nearly all returned, seemingly satisfied that there are worse places in the mountains than Canyon City.

Engineering.

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

This Society held its stated fortnightly meeting at its room in the Cooper Institute Building, New York City, on the evening of Tuesday, Sept. 29th, the President, Jas. A. Whitney, in the Chair.

The greater portion of the evening was occupied in the reading of a paper on the "Filtration of Water for Industrial and Domestic Purposes," by Mr. Lawrence Holms, an engineer of Paterson, N. J.

The writer opened his essay with a few comments on the statement of Liebig, that "the quantity of soap employed by a people was a test of their civilization," remarking that this does not hold good in all cases, inasmuch as in the city of Glasgow, Scotland, the introduction of water from Loch Katrine had effected an annual saving of two hundred and fifty thousand dollars, in the use of soap. He then gave a rapid glance at the magnitude, as compared with modern water-works, of the aqueducts built by the Romans in the lands conquered by their arms, and of those constructed by the Moors in Spain, and the old Peruvians in South America, and passed to the condition of the water used for ordinary purposes in various large cities of the world at the present time, citing, as an example paralleled by many other cases, the state of the London water, which, he averred, contains two and one-half per cent. of organic impurities, or nearly a tea-spoonfull to every glass of water. He also urged that it is not only necessary to purify the water for drinking, culinary and cleansing purposes, but also to do so for use in steam boilers, to prevent corrosion from organic and scale from mineral matter, and also for paper-making, in which the paper stock and the product made therefrom, is often very materially injured by extraneous earthy matter.

The writer then gave a very full description of the several plans put in operation for filtering water on a large scale in Europe, for which we have only space for a brief mention. One of the earliest, if not the very first project of this kind was one suggested by James Watt, and afterwards practically carried out by Telford as long ago as 1806, in supplying the city of Glasgow from the river Clyde. In this brick tunnels without cement at their upper sides were run through a sand-bank, which jutted into the river; these tunnels covering to a well twelve feet in diameter. The water filtered through the sand and passed to the well, whence it was pumped by steam power to supply the city. Systems somewhat similar to this are employed at Nottingham, England, which receives its water from the river Trent, and also at Toulouse, France, the tunnels being formed of open brickwork under the beds of the rivers, and the sand and gravel of such beds constituting the filtering media. Another plan still in use to some extent where the banks of the river are of loose or porous soil, is to form a basin below the level of the river bottom, into which the water may percolate through the river bank. Something of this kind is being adopted by the Aqueduct Board of Newark, N. J., who are about to supply the city from the Passaic River. In this case the filtering basins are to be 150 feet wide by 300 long, with a depth of eight feet below the ordinary low water mark. The cost of the work, including a wharf along the river bank, will be about $150,000. The writer held that while basins would doubtless answer a good purpose as settling ponds, this system can never be relied upon for purposes of filtration. Still another plan was that employed to purify the waters of the river Cant, which runs through the town of Paisley, Scotland, and which is blackened with the refuse of the many large dyeing establishments along its banks. In order to fit this water for dyeing purposes, vats about ten feet deep were sunk in the bed of the stream, and furnished with perforated false bottoms on which the filtering material was laid, the water in its purified condition being drawn from underneath the false bottoms.

The writer claimed that to filter the water supplied to the city of New York, by any of the Scotch or English plans, would require a filtering surface of twenty-four acres, and described a filtering apparatus devised by himself, which he stated would secure the same result with a filtering surface of only 2,000 square feet. This improved filter belongs to the class of close or pressure filters, and one of its essential features consists in the peculiar nature of the filtering medium employed, which was set forth as an elastic cabonaceous substance, possessing great filtering powers, and capable of being very readily cleansed when required.

A spirited debate followed on some points evolved by the reading, and which was participated in by Messrs. Harrison, Holms, A. W. Hall, and others.

Another Great Blast was let off at Lime Point on Saturday last, under the direction of Col. Mendell. The bluff projects boldly from the mountain, and it is about 250 feet high, coming down to the water's edge. It was the object of the blast not only to break up the rocks, but also to throw as much as possible into the water, to save wheeling it there. About 80,000 tons were thrown down, sufficient to give forty men a month's work in hauling it away. A tunnel was driven eighty-three feet into the mountain, with side tunnels of still greater length running from the main gangway. At the extremities of these were the charges, consisting of from 4,500 to 8,000 pounds of powder each, or a total of twelve tons—the horizontal lines of rock to be blown out varying from forty to seventy feet between the powder and daylight—the perpendicular line to be effected by this undermining being about 125 feet in hight. The powder was put loosely into boxes, and both fuse and copper wire were so placed as to fire each charge at several points in the masses of powder, to insure perfect and simultaneous combustion. The tamping was with clay, and the charges were set off with electricity.

Artesian Well in the Bay.—The Oakland Railroad Company are engaged in sinking an artesian well in the Bay of San Francisco, at the end of the railroad wharf, two-thirds of the distance from Oakland Point to Goat Island. The attempt is made in at least twenty feet of water at high tide. It is expected that soft water will be reached at no great depth under the bay.

Science and Religion.—"To search out the whence and whither of existence is an unquenchable instinct of the human mind; to satisfy it man in every age and in every country has adopted creeds that embrace the history of his past and future, and has eagerly accepted scientific truths that support those creeds. And but for this unquenchable instinct I firmly believe that neither religion nor science would have advanced so far as they have in the estimation of any people. Science has never in this search hindered the religious aspirations of good and earnest men, nor have pulpit cautions, which are but ill-disguised deterrents, ever turned inquiring minds from the revelations of science. A sea of time spreads its waters between that period to which the earliest traditions of our ancestors point, and that far earlier period when man first appeared upon the globe. For his track upon the sea man vainly questions his spiritual teachers. Along its bitter shore, if not across it, science now offers to pilot him. Each fresh discovery concerning pre-historic man is as a pier built on some rock its tide has exposed, and from these piers will one day spring arches that will carry him further over its deeps."

One of our deepest thinkers, Mr. Herbert Spencer, has said: "If religion and science are to be reconciled, the basis of the reconciliation must be this deepest, widest, and most certain of facts, that the power which the universe manifests to us is utterly inscrutible." The bond that unites the physical and spiritual history of man, and the forces which manifest themselves in the alternate victories of mind and of matter over the actions of the individual, are, of all the subjects that physics and psychology have revealed to us, the most absorbing and perhaps inscrutible." In the investigation of these phenomena is wrapped up the past and the future, the whence and the whither of his existence; and after a knowledge of these, the human soul still yearns and thus passionately strives.—*Dr. Hooker.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:

Saturday Morning, Oct. 31, 1868.

Notices to Correspondents.

SHAKER, San Mateo.—The fact of bubbles appearing on the surface of streams and pools of water during the late earthquake, is by no means surprising, in fact the non-appearance of such occurrences would be the more surprising of the two, the bubbles in question arising from a very simple occurrence, often appearing on the surface of stagnant waters without any artificial or natural shaking preceding their appearance, as our correspondent may easily convince himself by taking his station on Brannan street bridge, about the time of low water. It has been said by a morning contemporary that "the waters of Pescadero Creek became muddy in a moment, and the surface was covered with large bubbles. These, when a match was applied to them, burst with a slight report and a small flame, showing they were filled with an inflammable gas, that must have come from the bowels of the earth." The gas so emitted was in fact light carbureted hydrogen, or as it is sometimes called, marsh gas, owing to its usually being found in connection with such places, and is the fire-damp of the coal mines. Marsh gas requires twice its volume of oxygen for its complete combustion.

ELECTRICIAN.—Ozone is insoluble in water, and in solution of either acids or alkalies. Its bleaching powers are considerable and it acts rapidly as an oxidizing agent. It will corrode organic matter, such as cork or caoutchouc when employed in connecting experimental apparatus. Fragments of iron, copper and even silver, when moistened, rapidly absorb ozone, and become converted on their surfaces into oxides; silver even becomes a peroxide, notwithstanding the metal is wholly unchanged by ordinary oxygen. Paper soaked in a solution of sulphate of manganese shows the presence of ozone by becoming brown, owing to the protoxide of the sulphate being converted into the peroxide of the sulphate through its agency. If stained black by sulphide of lead, the dark appearance is soon converted to white, owing to its being changed into sulphate of lead.

L. J.—The phenomena of the susceptibility of melted metal, absorbing gaseous substances was observed and explained many years ago. The circumstance having first been observed in the case of what is termed the spitting of silver when a quantity of the pure metal remains in the cupel, at the completion of the refining process. This is now well known to be occasioned by the absorption of oxygen. The recent experiments of Deville have, however, greatly extended our knowledge respecting this quality, not only in other metals, but also with different gases, especially hydrogen.

WANDERER.—Fluor spar will absorb ordinary sulphuric acid when mixed with the powdered mineral, and the two will eventually be found to form a transparent, viscous mass, from which fumes of hydrofluoric acid will be evolved if the mixture is heated to 100° and upwards. It is by similar means that the corrosion of glass called frosting, is effected.

Artificial Crystallization of Gold.

Natural crystals of gold have been frequently found, in all of the gold-producing countries in the world, though they are sufficiently rare to make them, when well crystallized in large octahedrons, a great wonder to those who do not ordinarily find what may be read about such things in books, and a coveted prize to mineralogists, who value specimens in virtue of their crystallization and species. But the artificial crystallization of gold has never been heard of, or thought of heretofore, so far as our experience extends. We have before us a little bottle full of very perfect artificial crystals of gold, such as would make the eyes of any mineralogist glisten. They were obtained accidentally, in a manner so simple that it seems strange the discovery has not been made before, by some of the retorters and assayers who have been handling these same crystals hundreds of times without recognizing them as such, because hidden always under quicksilver, from which nobody has been able to separate them for examination.

These specimens were presented to us by W. A. Begole, hardware and tin merchant, of Red Dog, Nevada County, who deals a little in gold dust, and does retorting and melting for the miners.

By some means or other, in retorting the quicksilver from gold amalgam a quantity of gold is always carried along with the rising fumes, and deposited with the quicksilver in the condensing vessel. As gold has never been *proven* to be chemically volatile to so considerable an extent as would have to be accounted for in practice—though it might be more volatile in its combination with quicksilver, than in a pure metallic state—probably this volatilization is to be accounted for mechanically, by quick retorting under great heat. A quantity of such retorted quicksilver was put into a glass bottle, and let stand for about six months, when, on pouring it out, granules were observed at the bottom. These could not be saved in the form of coherent crystals, and were "burnt" in trying to separate the quicksilver. They were quite small.

On another lot which had not been retorted but strained through a cloth, acid was next used to get rid of the quicksilver, and the result was a residue of fine, large, but very friable crystals, which were subsequently hardened by a gentle calcination. Only part of the gold obtained was crystallized; the quicksilver in use weighing 75 pounds, the crystals obtained therefrom valuing at $5, and the uncrystallized gold remaining, at $20. This gold came from the Chalk Bluff range, where the metal is finer than on the Blue Lead, assaying .966 to .970; the remaining thousandths consisting of silver and copper.

The crystallization is tesseral, like that of natural gold. Octahedral and dodecahedral surfaces are well developed, the edges frequently salient, and the angular points flattened down. Reticulated masses, and twins in a variety of shapes,—one of them making a beautiful Maltese cross,—are observed, but not a single perfect octahedron is amongst them. The largest surface is an octahedral one, a quarter of an inch across at the base.

TIDE LAND CLAIMANTS.—Claimants to the salt marsh and tide lands, and lands reclaimed, who constitute, according to the 5th section of the Parish Bill, "Settlers who may purchase at appraised value," are requested to file their notices of claim with the Board of Tide Land Commissioners on or before November 1st.

THE CHEEFOO GOLD MINES in North China were imperfectly developed by the Chinese between A.D. 950 and 1386, and then abandoned till the Chinese "Californians" reopened them.

White Pine.

The ores found on the top of the high hill which has recently become famous under paragraphic headings of "White Pine,"—the location of another city of the interior,—are very pure chlorides, found in irregular deposits under a thin stratum of limestone, and filling crevices, caves, and variously shaped openings, in dolomite. Such is the most reliable information that has come to us. As chloride ores are always surface ores, it is not at all improbable, however, that the regular veins will soon be discovered, leading down to greater depths, where the ores will assume the character of sulphurets. Richness, to $10,000 a ton, is nothing very wonderful for chloride deposits, but the extent of some of these deposits at White Pine makes their occurrence a matter of interest in the history of mining. The Eberhardt deposit is from 40 to 50 feet wide, and from 80 to 100 feet in length. The depth has not been reported, but it is the opinion of the miners that the distance in that direction is greater than the dimensions horizontally. Similar rich deposits have been found in all new silver mining countries, and some of them have been described very fully, so that we can make comparisons as to the nature and influence of the country rock upon such deposits, and the character and relationship of the minerals associated therewith. Surface infiltrations, such as these will probably turn out to be, would not be influenced, however, in any manner by the country rock, except as to the existence therein of a tendency to cave-formation, and the consequent offering of suitable receptacles for infiltration or precipitation.

Shermantown and Hamilton are the names of two new towns in the vicinity of the Eberhardt and Keystone mines. This rich locality is on the top of a wooded hill 9,000 or 10,000 feet in hight, having gradually sloping sides—distant easterly from Austin 120 miles, and southerly from the overland stage road, (as near as we can learn) about 45 miles. In ravines where there has been considerable denudation of the dolomite, it is observed to be 400 feet thick, and overlying a formation of slate. Down in the valleys where silver ores have been discovered, they are not so likely to be chlorides, but sulphurets and combinations with the sulphurets of lead and antimony. How it happens that these extensive deposits of chloride are found mainly on the top of the hill, and not in the valleys, is a fair question for the local geologists. As the dolomite is found teeming with fossils, there will be no difficulty in determining the age and relationship of this formation to other sections, and possibly that of the slates as well. Great similarity has been found to exist between the White Pine and the Reveille District, which is more in a southerly direction from Austin. Everywhere along the borders between the dolomite range and the granite or slate rocks, the veins and deposits are said to be found only moderately rich.

It is not probable that the White Pine chloride deposits are continuous, either in a vertical or horizontal direction. Locally, they may extend sometimes for a considerable distance under the limestone capping, like the copper and iron *rasenlauefer* mined in many parts of the world; but nothing so continuous or regular as those, has ever been found elsewhere in the case of silver ores. Speculation and adventure are more likely, therefore, to reap the first rewards, than capital.

The chloride is said to be mixed with a little darkish silica, but to be otherwise very clearly parted from the country rock. Assays go up as high as $5,000 to $10,000. The highest authenticated assay that we are aware of was one made by Boalt & Stetefeldt, at Austin, which reached $16,000. As it would certainly not require more than fifteen to eighteen cubic feet to make a ton, some of these deposits, it would appear, must range from 200 to 1,000 tons. The Eberhardt mine, it is said, has already produced more ore containing $1,000 to the ton than either the Mexican Ophir, the Gould & Curry, or any other of the mines on the Comstock lode.

Mining at White Pine is not entirely a new thing. The mines were discovered three years ago on the west side of a range of hills, and the building of a mill was commenced last year. In June, 1867, an Indian came to the carpenters' camp, and said they were not at the right place, that there was more silver on the other side; and as an evidence of the truth of his assertion, he showed a piece of rock worth $2,700 to the ton. It was not until November that the claims were located and the importance of the discovery made public. The snow in the cañons does not disappear till May.

Three mills are under way, and that of Capt. Page will be completed in less than a month's time. At so considerable an altitude, winter will set in probably about the end of November. As wood is plentiful, cabin quarters will not be wanting; and the winter promises to be a gay one at Shermantown, and Hamilton, and the surrounding ranches.

THE NEW YORK SOCIETY OF PRACTICAL ENGINEERING.—Some three months since, a number of scientific gentlemen met in the city of New York and organized an association to be known by the title of "The New York Society of Practical Engineering." This organization is designed to fill a long existing want, by taking up subjects of practical and popular importance in the several departments of engineering, and making them the topic of thorough and exhaustive inquiry and discussion. As an illustration of the class and character of these subjects, may be mentioned those that have already been considered at the meetings of the Society—for instance: "Wooden Pavements for City Streets;" "Water Meters and their Uses;" "The Cleaning and Disinfection of Streets;" "Elevated Railways," and "The Filtration of Water for Industrial and Household Purposes."

At each meeting—the meetings are held once a fortnight—a paper is read on the subject for the evening, which is followed by a discussion designed to draw out practical information and suggestions to fully elucidate the topic in hand. The attention of the Society will not be restricted to any especial branch of mechanical industry, but will include every department of engineering, practical in its nature and important to the general public, or closely connected with extended industrial interests. It is designed at no distant day to give due consideration to the present condition of mining engineering, the processes and machinery employed therein, and also the as yet only partially developed art of "Agricultural Engineering," with its prominent and disputed feature of steam plowing.

There is no society of the character indicated, the proceedings of which have been so extensively reported by the press of the Atlantic cities, as those of the one of which we are speaking; and believing that these will be of interest to our readers we have made arrangements by which reports of the transactions of each meeting will be forwarded to us at once for publication in our columns, the report of the meeting of September 29th being published on another page of the present number of the PRESS.

CHEMICAL GEOLOGY.—Those who have read, or glanced at portions of Prof. Forbes' lecture on Chemical Geology, which has been running in our columns for a few weeks, will agree with us that the subject has not only been remarkably well treated, but that it is interesting, and, for a question so purely scientific and theoretical, unusually free from technicalities. It is worth saving entire. Our next number will conclude the lecture.

Nitrate of Potash and Nitrate of Soda.

Alex. Macrae, the Liverpool oil and produce broker, in his last weekly price statement to San Francisco merchants, publishes a circular in a peculiar style, to the effect that in the Trent affair the first *coup de guerre* of the British government was to suspend the exportation of the above named articles from England and her dependencies, to America; that anybody watching the imports into New York, Boston, etc., will see constantly among them, large and small lots of saltpeter and nitrate of soda, from Liverpool; that we draw our supplies of saltpeter from the East Indies—our nitrate of soda from the west coast of South America, but science, *of very late years only*, having taught us how to make our saltpeter or nitrate of potash, from the nitrate of soda, rendering the saltpeter refiner independant of the East Indian base, the Union Pacific Railway, via San Francisco, lays bare to the United States the nitrate of soda fields of Peru and Chili; wherefore little wisdom is required to foretell, that San Francisco must soon rival Liverpool as a depot for nitrate of soda, and it will not be surprising to see 43,000 bags here on American account, as they have now in Liverpool, on British account,—cutting off the exports of saltpeter and nitrate of soda from Liverpool to the United States, and to Canada, likewise, and leaving the gunpowder manufacturers and provision packers of the west hereafter certain of their saltpeter for all time to come. "Thus," concludes the circular, "will this new line of rail talk to our West Coast trade."

From which it is to be inferred that Mr. Macrae is more of a cosmopolitan than Englishman, in view of his interests, and that somebody is about to open a branch house at San Francisco. But a material consideration in the business is, or ought to be, that America will *not* be dependent upon Chili for nitrate of soda, and that it will not be necessary to make saltpeter (nitrate of potash) from Chilian nitrate of soda, for two reasons; firstly, because we have some nitrate of soda ourselves, and secondly, because we have also the natural mineral nitrate of potash, which is better, in commercial quantities in the form of deposits in the interior.

THE EARTHQUAKE is almost forgotten. It will be at least a month, however, before philosophers will cease inventing original theories on the subject. Like plagne, and cholera, and bombshells, earthquakes (if not hanging) can be got used to. The San Franciscan walks the streets gaily, and is even in a more thoughtless mood than if the city and county of San Francisco were not subject to earthquakes. Yet it cannot be gainsaid that an occasional yawning crack will here and there stare him in the face, or catch his eye as he turns round to look behind him, that will startle him like the apparition of a chattering demon. One may realize, in these times, that in genuine earthquake countries there cannot be found such a thing as a solid stone or brick wall anywhere, high or low, binding or no binding, and that it is only a question of a little less or a little more earthquake whether it must totter or fall,—though the chances are a thousand to one that it will merely crack and totter, and will not fall. We accept these chances without giving the matter a moment's thought, and we even smile at those who would think of doing otherwise.

NEW BOOKS RECEIVED.—The following have been received from A. Roman & Co., and will be fully noticed hereafter:

A Treatise on Steel. Comprising its theory, metallurgy, properties, practical working and use. By M. H. C. Landru, C. E.; with an appendix on the Bessemer and Martin processes.

American Houses. A variety of original designs for rural buildings, illustrated by twenty-six colored engravings, etc. By Samuel Sloan.

Work at the Foundries.

THE PANS, CONCENTRATORS AND BLOWERS.

Offices are kept at foundries by the representatives of various patent amalgamating pans—Varney's, Knox's, and others, whose location we have not ascertained. The concentrators are similarly represented, always in or about the foundries. As the patentees are in only at a particular hour in the day, they are seldom met with, except by persons who go after them pertinaciously, and who persevere till they find them. A steady, but not very brisk influx of orders seems to exist. Concentration attracts, at the present time, more attention from miners of an enterprising turn, than amalgamation; the novelties and peculiarities possible to devise in iron amalgamating pans having been about exhausted.

Hungerford and Hendy's concentrators show signs of a good deal of life and competition. The former has just made arrangements for the manufacture of a number of his machines at the Pacific Iron Works, where he may be found superintending operations himself. Four of them have just been sent to the Hardenberg & Haley mine, near Jackson, Amador County, and two of them to the Rising Star mine, in Idaho. At the Coe Mill, Grass Valley, four of Hungerford's improved concentrators are now used, being the first tried in that section, and it is claimed that they are saving 95 per cent. of the sulphurets there,—which is not probable, as no kind of wet concentration has been able to attain anything like that figure heretofore, with much more delicate machines. In principle, Hungerford & Hendy's concentrators are the same. Mr. Hendy's office is at the Union Iron Works, up stairs, in Prof. Blake's old quarters. His concentrator obtained the preminm at the late Mechanics' Institute Fair.

Some Borlase buddles are being manufactured in this city, but the parties, and the intended locality of operation, are unknown to us. The round buddles are undoubtedly well adapted for the washing of fine ores, requiring delicate handling; but it is scarcely just to name them after Mr. Borlase, who merely introduced them into Cornwall, from Prussia.

BLOWERS.

In smelting, and for ventilating purposes in mining, a good and economically working blast engine, which does not get out of order easily, is an important desideratum, and since ventilation has become a matter of so much importance in the deep Nevada mines, we observe there is an increased energy in supplying the demand for different articles of this character. There are four kinds manufactured, the cylinder and piston machine for large furnaces, the fan, the Root patent rotary blower, and the cagniardelle.

The Root blower is manufactured at the Globe Iron Works, at Stockton, by Keep & Bargion. Within six or eight weeks a dozen of them have been sent to some of the principal mines in Nevada,—the Hale & Norcross, the Imperial, etc. They are driven usually by the hoisting engine. A very large one is being made for a cupola blast furnace, to be used by the Pacific Railroad Co., at Sacramento. In New York, one of these machines is being built for the underground railroad, which is to be 20 feet in diameter and 20 feet in length, and which is intended to move a train at the rate of 60 miles an hour. One of them may be seen in operation at a cupola in Kimball's carriage factory in this city; and there is another at the McComb copper furnace, in Tulare County.

The Formhals cagniardello was described in the PRESS of Sept. 26th, 1866. It runs in water, and is very economical as to power It is manufactured by the inventor, Mr. F. Formhals, on Merchant street, opposite to the office of the MINING AND SCIENTIFIC PRESS.

A GOOD THING.—Some Yankee has invented an arrangement to prevent heavy trunks from being injured by careless handling. It is simply an india rubber ball on each of the eight corners. Strange it was never thought of before. We can imagine the fiendish look of rage and disappointment which passes over the countenance of the baggage-smashing porter, who for the first time sees one of these contrivances. The delight of his life is gone. The malignant chuckle with which he used to drop a lady's traveling trunk from his shoulder to the platform,—in full view of its agonized but helpless owner,—is "played out." It is stated that a trunk filled with books, if protected by this means, may fall from a hight of twenty feet without injury.

HISTORY OF ARIZONA AND THE COLORADO RIVER COUNTRY.—C. G. Johnston, of No. 631 Sacramento street, has issued the first number of a work, to consist of 25 parts, profusely illustrated with actual photographs taken on the ground by the author, intended to give an idea of this wonderful river and country. With a vast extent of inhospitable desert, Arizona has also a great area of very fertile country, including bottom lands as rich as those of the Mississippi, and a fertile, richly grassed and well wooded and watered mountain country, which enjoys the climate of the Middle States in summer, and that of the South in winter.

CABINET WORK.—California cabinet-makers well improve their field for fine work, and are deserving of credit for new and elaborate designs for furniture. We have just received from the establishment of Messrs. Johnson & Best, 717 Market street, a new office desk, made of Spanish cedar, finished so as to show the natural color and grain of the wood, which is truly elegant. Messrs. J. & B. have been engaged at their trade in this city for the past ten years.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M E, in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of teeth, when so desired—the only absolutely safe anæsthetic ever discovered In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 15v16tf

IT
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instant-
ly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 539 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

BUILDERS' INSURANCE COMPANY—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.
FIRE AND MARINE INSURANCE. 10v14t9pqr

PACIFIC
Rolling Mill and Forge Co.,
SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Pistons and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.
Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.
The highest price paid for Scrap Iron. 9v14-3m9p

A Book for Every Miner and Scientific Man.
JUST PUBLISHED,
KUSTEL'S NEW WORK,
CONCENTRATION
Of all kinds of Ores, and the
CHLORINATION PROCESS,
For Gold-Bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally.
Price, - - - - - $7.50
A liberal discount to the Trade. For sale by the Booksellers Sent to any part of the United States, postage paid, on receipt of the price. Address,
DEWEY & CO., Publishers,
Office of the Mining and Scientific Press, 414 Clay street,
16v1tf SAN FRANCISCO.

A NEW PAPER
Will be published on SUNDAY NEXT, November 1st, to be called
THE SPIRITUAL LIGHT.
Published (for the present) Monthly.
It is especially designed to promote the cause of SPIRITUALISM, and assist in the discussion and investigation of all subjects pertinent thereto; which will naturally include Religion, Philosophy, Ethics, Morality and Universal Liberty.
TERMS OF SUBSCRIPTION.—One copy 1 year (invariably in advance) $1; Three copies to one address 1 year, $2 50. For convenience of remission, Greenbacks will (for the present) be received at $1 25 to the dollar in gold—we hope soon to be able to receive them at par.
TERMS OF ADVERTISING.—One square, one insertion, $1 (equal to 10 lines of ordinary brevier type); One square 3 months, $2; One square 1 year, $5; One column, 1 year, $25; do, 6 months, $15; do 3 month, $10.
A copy will be sent gratuitously on application to the publisher, to all places where one cannot be seen at the Bookstores. Address GEO. G. W. MORGAN, Editor and Proprietor, 472 Harrison street, between Third and Fourth street; or, 1578 Post Office, San Francisco. 18v17t

DESKS AND OFFICE FURNITURE.
JOHNSON & BEST,
Manufacturers of all kinds of
Desks and Office Furniture,
717 Market street, near Third.
Warerooms up stairs. A large variety of Desks always on hand; all kinds of Office Furniture and Cabinet Work made to order.
18v17qr

SULPHURETS;
What they are;
How Assayed;
How Concentrated;
And How Worked;
With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.
By WM. BARSTOW, M. D.
Published by A. Roman & Co., San Francisco.
For sale at this Office.--Price, One Dollar.
With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

LOOK TO YOUR ROOFS!
Pacific Concrete Company,
No. 622 Clay street,
Factory on Kingstreet, between Third and Fourth street.
New roofs covered and leaky roofs repaired, in thorough and substantial manner, promptly and at very reasonable rates. Proprietors of Eagan's Patent. 18v17tf

To Capitalists.
Two rich Gold-Bearing Quartz Veins—one of 6,400 feet, and the other 3,000 feet—situated in El Dorado County, about fifty miles from Sacramento, are offered for sale, under reasonable conditions. For particulars, inquire at J. A. MARS', 512 California street, near Wells, Fargo & Co's, San Francisco. 18v17-4w*

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to the public to warrant publication.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

WILLAMETTE IRON WORKS,

PORTLAND, OREGON.

Steam Engines, Boilers,

SAW AND GRIST MILLS,

MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

Corner North-Front and E streets,
18v13-1y One block north of Couch's Wharf.

Globe Iron Works,

STOCKTON, CAL.

KEEP & BARGION,

MANUFACTURERS OF

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,

High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

OPENING OF THE FIRST PUBLIC RAILWAY. "Tuesday, the 27th of September, 1825, was a great day for Darlington. The railway was at length about to be opened. A great concourse of people assembled. The locomotive was driven by Geo. Stephenson himself; after it came six wagons loaded with coal and flour, then a covered coach containing directors and proprietors, next twenty-one coal wagons filled with passengers, and lastly six more wagons loaded with coals. A horseman, with a flag, headed the procession. The locomotive was only supposed to be able to go at the rate of four to six miles an hour; and an ordinary horse could easily keep ahead of that. Many people tried to accompany the train by running, and some gentlemen on horseback galloped across the fields to keep up with it. At a favorable part of the road, Stephenson determined to try the speed of the engine, and calling upon the horseman with the flag to get out of the way, he put on the steam. The speed was raised to twelve, and then to fifteen miles per hour. The runners, the horsemen, and the flag-bearer, were soon left far behind. At the station a band of music, and 150 more passengers, were taken on board therefrom."

WHAT ENGLISHMEN SAY.—The Americans have a type of beam engine which has answered exceedingly well for their river boats, and is, indeed, employed, and, so far as we can learn, with good results, upon the Pacific Ocean, both for the ships running between Panama and San Francisco and those from San Francisco to Japan. It is a well-known but unique type, which there is no occasion to criticise, but it is, of course, wholly unsuited for war ships. In their newer war vessels, the Americans, under Mr. Isherwood's engineering, have a class of machinery of which we trust they may long enjoy a monopoly. We have shown, in former articles, how much space it takes up in the ship, how much it weighs, and its great complication, while at the same time the power developed, when considered with regard to the leading dimensions, is much below what is required from English marine engineers. We cannot adopt the American big guns, the "great chunks of cast-iron with a hole in them," as the Americans delight to describe them, but we may see what we can do with their monitors, and in return let them consider whether it is not worth their while to take our marine engines. Indeed, as a mere matter of dollars and cents, they can have their ships towed over here and engined, or, better still, have them built here both better and cheaper than in the States.—*Engineering.*

THE READING MARKET.—There is an American Literary Bureau in New York that undertakes to get published works of merit from authors unknown to fame. It professes to supply suitable artieles for public journals. There is no reason why there should not be a gain in the quality of newspaper articles, by having a market which offers inducement to talent to make effort, and to proprietors to seek for varied literary productions fresh from the pen.

THE CHASSEPOT GUN A COMPLETE FAILURE—AN AMERICAN PLAN TO BE ADOPTED. A Paris letter to the New York *Herald* states that the Chassepot gun is a complete failure, and one of the most dangerous weapons ever supplied to an army. Two or three systems of alterations have been tried, and it is probable that one on an American plan will be adopted, and with it a radical change in the character of the ammunition.

SUBTERRANEAN WATERS.—Recently a portion of the track of the Bellefontaine and Indianapolis Railroad, about two hundred and fifty feet long, sank over sixteen feet, and the ground around sank with it. All the trains have been obliged to stop, and the track has been raised by "cribbing." Fish from twelve to eighteen inches long appear where water has risen out of the crack. It is supposed that a subterranean lake exists.

MAMMOTH FARMS.—The plan of investing largely in wheat lands of Minnesota, which are sold cheap, and of opening immense farms, seems to be in favor with heavy capitalists. Such are the Dalrymple, Marshal and Donaldson, and Paxton farms. Commodore Davidson has entered 17,000 acres of excellent wheat lands, and next year contemplates breaking extensively on this tract, preparatory to raising wheat the following year.

MANY English gentlemen living in the suburbs of London, disgusted with the extortions of the railway companies, have purchased velocipedes, and declare their independence of steam.

Enterprises and Developments.

Twelve hundred bottles of Water are dispatched from tho Napa Soda Springs daily.

The Collegiate Institute nt Napa is to be placed iu completo order and opcued on the 1st of January.

Secretary Sewnrd and Baron de Stoekl, Russian Minister, have under consideration the right of the American fishermen to the Alcutian Island fishing grounds.

Australia will doubtless furnish beef to t'io Londoners in the future, as thousands of cattlo roam there at will, and are, as in South America nnd in the Sandwich Islands, destroyed for hides and tallow.

The Nevada State markets are now supplied daily with fresh sea fish from San Francisco—bass, tom-cod, smelts, flounders, etc.—which are preferred hy many of the Silverlanders to Lake Tahoe trout.

A first class young ladies' seminary is proposed at San Leandro, Alameda County. A new seminary building forty by forty feet, two stories high, with a cupola, will he crected, says the *Gazette*, ncar the center of the town for this purposc.

The Hawaiian bark Bernice arrived from tho Okhotsk Sea, n few days ago, with 130,000 codfish. This is the last of the fleet. In round numbers our total rceeipts from the northwestern fishing grounds, for the season, have been 600,000 fish.

During the present season ninety tons of raspberries have heen raised in Alameda County. The average price at which they were sold was fifteen cents per pound, making the total value of the crop raised upon sixty acres of land amount to the round sum of $27,000.

The southern portion of the State is gaining in population rapidly. The Orizaha leaves her wharf crowded with passengers, standing room being scarcely left on board, and a large portion of them are in pursuit of lands for permanent homes nt points from San Luis Obispo southwards to the Mexican linc. Another steamer is to he put on the route.

The Fiji company, consisting of Australia adventurers and capitalists, has at length consummated its treaty with the King of Ban, and the document has been ratified by the Commodore of the Australian squadron. The American debt owed by that sovereign is to he paid with interest within a year, and the company will at once commence operations for the development of the islands acquired.

TIMBER-ROT.—There are two situations, and only two, iu which wood is not attacked by decay: where sound, well-seasoned timber is kept perfcctly dry, and where it is kept constantly immersed in water. The timbers in the roof of Westminister Hall are known to be 450 years old. The carvings on the stairs are 300 years old. Some of the interior of the Basilica at Rome, his not been renewed for 1,000 years. The piles of old London hridge are still sound, though sunk in the mud of the Thames 800 years ago. There stands in the altar of the old brick church at Wethersfred, a table made from the oak of the first structure for worship in the place. The trees furnishing this timber must have beeu cut two hundred and thirty years ago. On the other hand, where the timber is subjected to extreme alternations as regards moisture, rot begins with most kinds in from three to five years.

INTELLIGENT BED-BUG.—An inquisitive gentleman wishiug to know how the hug became aware of human presence, tried the following experiment: He got into a bed suspended from the ceiliog without any tester, in the middle of an unfurnished room. He then placed on the floor a bug, which guided, probably, by smell, pondered the means of reaching the bed. After deep reflection, it climbed up the wall, traveled straight across the ceiling to the spot immediately over the bed, and then dropped plump on the observer's nose. Was this, or was it not, au act of intelligence?

ENGLAND is alarmed at the emigration of inventors and skilled workmeu to America, and in order to avert further depletion, it is proposed to create a fund to develop important and approved inventions.

JOHN PERRY,
MANUFACTURER OF
Cocoanut Matting, Rugs, Mats, Etc.
And Cocoanut Fiber for Upholstery.
South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.
BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purposes:
1st. It is cheaper, all things considered, than most articles in use.
2d. It is the best and purest material known in the market, being entirely free from all offensive smell.
3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.
4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.
5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.
Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to palm, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16tm

OIL STOVES!
MORRILL'S
Petroleum and Universal Oil Stoves
Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.
I now offer a reward of $100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by
M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.
N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non illuminating flame and light on a wick as easy as a lamp. 21v16 3m

NEWLY INVENTED ANIMAL TRAP.—Messrs. A. J. Adams and B. P. Quivey, of this city, have received letters patent for an animal trap, invented by Mr. Adams. This trap is adapted to the capturing of animals of all sizes, and can be used with bait, or being set in their path it "goes after" the animals without bait. It consists of two pairs of sharply pointed hooks which are held apart by a spring, when the trap is set, and as the animals pass into the trap either to feed upon the bait, or as they pass over it, they press upon the trigger, and thus spring the trap, when the hooks instantly close and pierce the animal through the head or body, thus depriving them of "life, liberty, and the pursuit of" prey, at one and the same time. One of these traps now in possession of Capt. Douglas, on the ferry-boat, has caught nine beavers, having only missed capturing a victim once in ten times. The construction is simple and inexpensive, and will be very useful.—*Oregonian.*

SOIL CHANGED BY SETTLEMENT.—A letter from a late traveler in Nebraska notes some curious contrasts: "It is a frequent subject of remark in the Ohio Valley, that settling the country, clearing and ditching the land, constantly makes it drier; that old wells and springs are drying up, and each succeeding summer branches run dry which never did before The French Agricultural Report makes the same complaint, and calls upon the Government to stop the destruction of the forests, as the means of preserving the rivers. But here, with settlement, exactly the reverse phenomena are presented, and the quantity of rain in western Nebraska and Kansas has doubled within the memory of man. Perhaps this is due somewhat to the trees planted on new farms, but I think also that the breaking up of the sod allows it to absorb more moisture than it could in the prairie state, and in many instances turning a hundred acres of sod will renew an old spring. Fresh branches are starting in gullies which have been dry for hundreds, perhaps thousands of years."

BUERK'S
Watchman's Time Detector.
THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now
A Perfect Check upon the Watchman.
With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.
The Instrument is complete in itself, portable, and as reliable as the best lever watch
It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.
THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.
The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.
☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.
N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.
All communications promptly attended to. Address

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.
LEAVE WHARF, CORNER OF Brannan streets, at 11 o'clock A. M. on the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers for ASPINWALL for NEW YORK.
On the 6th, 14th, 22d and 30th of every month.
Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.
Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer, for St. Nazaire, and English steamer for South America. Through tickets can be obtained.
Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.
STEAMERS FOR OCTOBER, 1868.
The following Steamships will be dispatched on dates as given below:
October 6th—COLORADO..... Capt. W. F. Lapidge, Connecting with ALASKA, Capt. Gray.
October 14th—GOLDEN CITY....Captain E. S. Farnsworth, Connecting with OCEAN QUEEN, Capt. King.
October 22d—SACRAMENTO.....Capt. W. H. Parker, Connecting with HENRY CHAUNCEY, Capt. Connor.
October 30th—MONTANA.....Capt. J. M. Cavarly, Connecting with RISING STAR, Capt. Maury.
Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of $10 to $20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.
The Steamship GREAT REPUBLIC, Capt. S. Dosne, will be dispatched on SATURDAY, October 3d, at 12 o'clock M., from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.
For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

A New Treatise on Concentration of All Kinds of Ores.

INCLUDING THE CHLORINATION PROCESS FOR Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally, by GUIDO KUSTEL, M. E. & M., author of Nevada and California Processes of Silver and Gold Extraction—120 lithographic diagrams.

OPINIONS OF THE PRESS.

KUSTEL'S NEW WORK.—Mr. Guido Kustel has just put forth another volume, a copy of which we have received from the publishers, Dewey & Co., San Francisco. The book contains 120 diagrams on seven plates. In issuing the work, the design of the author appears to have been to exhibit the present state of the art of concentrating ores as practiced in the older and more experienced mining sections of the world, as well as in the more recent mining operations in California. The principles on which the system of concentration is founded are stated without entering into scientific reasons.

The dressing of ores is treated at great length, and the plan is based on these principles: "1st. Each constituent of the mass of ore must be brought to the highest value which can advantageously be given to it. 2d. The useful minerals must be concentrated only to the most advantageous degree of purity; and, 3d. All loss of the quantity and value of the useful mineral must be avoided as far as practicable." Reduction in its diversified modes—by rock-breakers, stamps, rolling mills, and grinding in arastras, pulverizers, Chili mills and pans—necessarily occupies large space by reason of its importance.

The plan of reducing ores by stamps, in either the wet or dry process, forms a complete treatise of itself, and may be studied with advantage by all persons connected with reduction works of that character. Concentration of gold ores is specially treated in section 49, and of silver ores in section 50. The latter subject should possess interest for our millmen and miners, as the plan of concentrating ores is certain to be resorted to as soon as the business is understood and reduced to a system.

The sections of the work devoted to the extraction of gold from sulphurets, arseniurets, or quartz, by chlorination, are based on Plattner's process of the property of chlorine gas to transform metallic gold into soluble chloride of gold. By this process it has been demonstrated that gold is extracted perfectly. Our author says the process was first introduced into Nevada, California, in 1858, where there are several establishments in successful operation.

The process of chlorination is described in the fullest manner, and embraces a particular description of the various roasting furnaces in use, as well as of the operation of roasting.

We commend Mr. Kustel's treatise to the attention of all concerned in the business of mining and reducing ores, to whom it must prove a valuable hand-book of practical knowledge.—*Daily Reese River Reveille, Jan.*, 1868.

Price of the work, $7.50. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS, San Francisco, who will supply orders, by mail or express, at wholesale or retail.

ATTENTION.—Virginia City, Aug. 9th, 1868—Dewey & Co., San Francisco.—Gents:

The Patent, enclosing your favor with Inventor's certificate, etc., came duly to hand, and for which please accept my grateful acknowledgements.

I am pleased to learn that the business of your agency for Patents, etc., is rapidly increasing. This is as it should be. Your promptness, fidelity and skill, as Patent Agents, entitle you to public confidence and patronage.

I can see no good reason why Inventors on the Pacific Coast should employ agents in New York and other Eastern cities to transact their business at the Patent Office, when we have among us those equally qualified by long study and large experience.

Yours truly, J. A. C.

New Mining Advertisements.

Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of October, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No 40 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary.

Office, Room No. 40 Merchants' Exchange Building, California street, San Francisco. oc31

Fogus Mill and Mining Company.—Location of Works: Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of October, 1868, an assessment of two dollars and fifty cents ($2,50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office in San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twelfth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Any stock upon which said assessment shall remain unpaid on the eleventh day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirtieth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, No. 414 Montgomery street, San Francisco oc17

Gold Hill Tunneling Gold and Silver Mining Company.—Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of October, 1868, an assessment (No. 11) of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, R. Wegener, 414 California street, San Francisco, Cal., or to the Superintendent, H. Huguet, Gold Hill, Nevada.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of November, 1868, shall be deemed delinquent, and will be duly advertised, together with costs of advertising, and unless payment shall be made before, will be sold on Wednesday, the ninth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. WEGENER, Secretary.

Office, 414 California street, San Francisco oc17

Greenwood Mill and Mining Company, Green- wood, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board Trustees of said Company, held on the tenth day of October, 1868, an assessment of fifty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 434 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.

Office, 434 California street, San Francisco. oc17

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of October, 1868, an assessment (No 26) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 25 Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the tenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of November, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 25 Merchants' Exchange, south side of California street, between Montgomery and Sansome streets, San Francisco, California. oc10

Kensarge Mining Company, Kensarge Dis- trict, Inyo County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the eighteenth day of September, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Alberding, F H	44, 45, 46, 47	79	$79 00

Office, 318 California street, San Francisco, Cal. oct7

Washington Mining Company.—Location of Works: Nevada County, California.

The regular Annual Meeting of this Company, will be held on SATURDAY, the SEVENTH DAY OF NOVEMBER, 1868, at one o'clock P. M., at the office of the Company, No. 318 Front street, San Francisco.

JOHN J. SCOTCHLER, Secretary.

San Francisco, Oct. 10, 1868. oc10

Machinery.

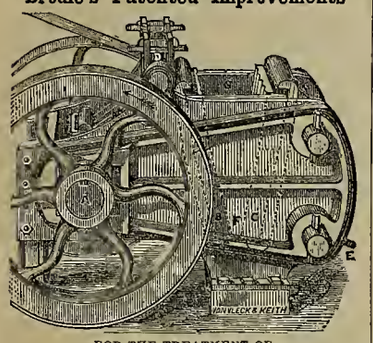
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everre-quired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and com pletely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 9-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will be, in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION
PATENT
Variety Molding and Planing
MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and to all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

IMPORTANT TO LUMBERMEN.

ANDERSON'S
Patent Mulay Saw Hangings.

These Mulays will cut FIFTY PER CENT. MORE LUMBER PER DAY than any other Mulay in use, with fifty per cent. less power. They are very durable, and easily kept in order, and warranted to give satisfaction. No Mulay Mill should be without them, as they will pay for themselves in a very short time. No other mode of manufacturing Lumber can compete with the Mulay Saw with this improvement. Send for circular. FULLER & CO.,

Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

HYDROSTATIC WORKS.

SAN FRANCISCO

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Hose and Hose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Baden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STAFF, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

I his Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-1f

[Written for the Mining and Scientific Press.]

Mining in Sierra County.

INDEPENDENCE QUARTZ MINE AND MILL.

This mine is situated on Wolf Creek, about twelve miles southeast from Downieville, and three miles above the formerly well-known rich "Fellows ledge." The first work was commenced in 1865, by starting a shaft on the ledge which is now seventy feet deep. The ledge stands nearly perpendicular. On the bottom of the shaft are two drifts on the vein, one southeast sixty feet long, the other northwest, about twenty feet long. The ledge is seven feet wide. About 150 feet from the first shaft another one is started. The ledge lies in talcose slate and granite, the slate on the hanging wall carrying much free gold. A new mill of eight stamps is erected, and started to work since the 15th of last month. The company will soon make a clean up, and to all appearance it will be a rich one. The members of the company are all Downieville men.

THE PHŒNIX LEDGE

is situated about three miles above Sierra City, and one mile east of the famous Sierra Buttes mine and mills, a little above the flume of Reis' mine. The Phœnix Company located five claims of 200 feet each. The ledge runs east and west, is from two to three feet wide, and stands about eighty-five degrees into the hill. An inclined shaft is sunk to ninety feet on the ledge, which is at the bottom three feet wide. The ledge to this depth has no water. The ore is very rich, showing much free gold. The company built a trail down to the river, and are packing the ore on mules. They erected at the river a prospecting mill of one battery of four stamps, worked by water-power, and secured the water-right for a large mill. Seventy tons of ore, the first crushing of this vein, yielded $2,400, and about 100 tons of ore are now out and ready at the mill for crushing, promising similar good results. The ore is very easily worked. One of the owners sold recently fifty feet for $3,000. The controling interest of six-tenths could possibly be bought for $20,000, of the owners, F. Funot, and Martini, at Downieville. Should this vein prove to be a fissure vein, which to all appearance can be expected, this might turn out a worthy neighbor to the famous Reis mine at the Sierra Buttes.

THE SIERRA BUTTES MINE.

This mine (Reis & Co.) is well known as one of the richest in California. It is paying regularly about $40,000 at each clean up, every six weeks. The company own two mills, one of sixteen stamps, the other of twelve stamps, without any of the modern improvements, and the pulp leaving the mills is worked by twenty arastras, on shares, of which the upper eight pay to the Reis Company one-fourth of the yield; the following five arastras pay one-fifth of the yield, and the lower seven pay $40 per month.

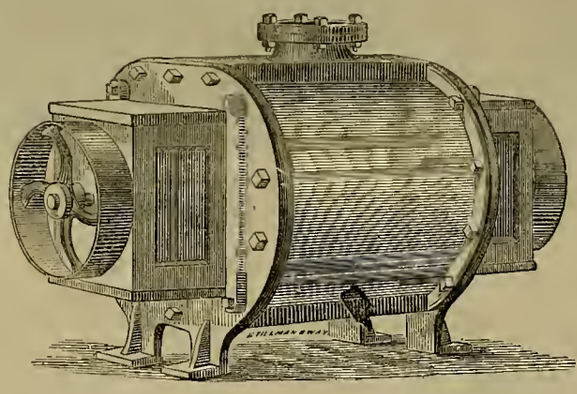
How incomplete this system of working is can easily be ascertained by testing the pulp after the same leaves the last arastra. The sulphurets assay from $300 to $400 per ton, and a fortune is lost in that way; the men renting these arastras becoming wealthy. The company owns three ledges, the Sierra Buttes, the Rose, and the Cliff ledge, of which the Rose ledge is the richest. If this mining property should be worked in the style of the Grass Valley mines, it would probably prove *the richest* mine in California. But the present owners do nothing but pocket the yield. There is not even a wagon road to the mine, and the county of Sierra has no more benefit from the mine than the little pocket money the workingmen spend by coming into town. It is well known that the owners of this rich mine do not even encourage the investment of capital in Sierra County mines, believing that there is no other mine of any value besides their own. But the time will come when the attention of capitalists will then be more directed to Sierra County. J. B. S.

GORGEOUS.—The Aurora Borealis, in its mysterious grandeur, was, on the night of the 16th ult., beheld by many. Its brilliant and symmetrical arches spanned the heavens from southwest to northeast, illuminating the spacious firmament with the halo of its glory.—*Alaska Times.*

OUR GREAT WORKSHOPS—THE "COMING" RICH MEN.—We clip the following from the *American Railway Times:* "Slowly but surely, the mechanical establishments of the United States are developing into proportions that rival the largest of those on the other side of the Atlantic ocean. Within the past six years, several of our locomotive manufacturing establishments have doubled their production, and are still enlarging their shops and increasing their force of men and machinery, while new establishments have been started and are proceeding onward with success. The same is true of our steel manufacturing, a business that is as yet but in its infancy in this country. It will not be many years before we shall have steel works that shall equal in extent and annual production even those of Krupp, Petin Gaudet & Co., Bessemer and others. We see the indications of this result in the extensive plans of the managers of these works, the rapid and easy increase of capital employed, and the increase in the quantity of skilled labor in this department, both from immigration and from educated home supply. In the manufacture of machinery and machine tools, there are several establishments that in extent of production and goodness of workmanship, are fully equal to the best in other countries. The same is true of several of our rail making establishments, some of them turning out from 70,000 to 80,000 tons per annum. With our 38,000 or 40,000 miles of finished railway, with iron ores and coal of the best quality in abundance, and a constant increase of from 1,000 to 2,000 miles of railway per year, it is not at all wonderful that rail manufacturing establishments should flourish, especially when it is considered that at least twelve per cent. of the whole mileage has to be re-ironed annually. No country in the world pays its labor, its skilled labor especially, so generously as the United States, and young men who are now leaving their schools, and other institutions of learning, ought to remember that by enlisting in the army of productionists, especially in the mechanic arts and metal departments, they have the best and strougest assurance of ultimate success. Give up the shop counter and yard stick to those who from bodily infirmity can not do better, and let every able-bodied young man prepare to do a man's work in developing and perfecting the great industrial interests of the country, certain that intelligent labor and application will bring all the reward that men desire—wealth, position, and influence. The field is broad and the harvest sure to all those who wish to labor therein."

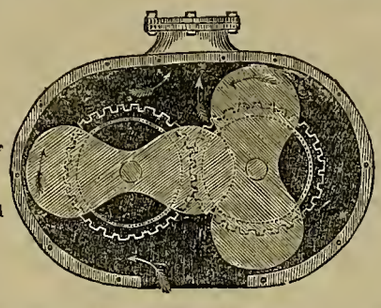
AMERICAN STEAMBOATS "NO GO" IN SOUTH AMERICA.—A correspondent of the *N. Y. Evening Post* writes thus from Para, Brazil:

Why is it that Americans, who build the fastest and the best steamboats in the world, have no orders for river steamers from South America? This question is easily answered. Sixteen years ago the Peruvian government wanted steamboats for the upper Amazon. A couple of New Englanders contracted for those steamers and made them "to sell." The boats soon went to pieces; and so evident was the cheat that for a long time the government refused to pay.



Brazil began steam navigation on her part of the Amazon, in 1853, and sent to England for her steamboats. Upon my inquiry, "Why not go to the United States for river steamers? the answer would inevitably be, "Oh, American steamers. we have had enough of them on the Amazon!" So to-day you will ascend the great river in hybrid concerns between a sea steamer and a river steamboat, but possessing the good qualities of neither. They are hot; the machinery so arranged that space and comfort are sacrificed to an astonishing degree. They were built by Mr. Laird, of Birkenhead, the same who constructed the Alabama.

A NEW BIT OR AUGER.—We were shown at the furniture shop of C. W. Schwamb, the other day, a new invention in the way of a bit or auger, which is one of the most complete things we ever looked at. It is called the "Expansion Bit," and will bore a smooth cut hole any size from seven-eighths of an inch to three inches. The "stock" is of good steel, and at the point it has a finely cut thread and cutter. Just above the cutter is a hole in the stock, in which is inserted and made firm by a small screw a sharp steel additional cutter with a highly finished lip, and this can be graduated to any size by a scale marked in one-sixteenths of an inch all along the slide. The bit is the invention of a man named Clark, of Connecticut.—*Idaho World.*



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

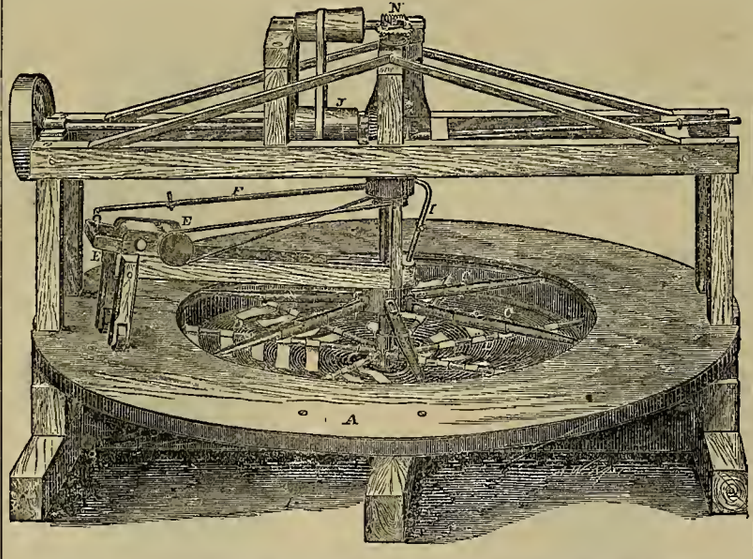
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.



For circulars and further information, address

KEEP & BARGION,
Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE, STEPHENS & HARRY.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-raised, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 280.—Schorl, Napa County. It contains no iron, and becomes colorless before the blow-pipe.

No. 281.—Greenstone porphyry, with hornblende crystals, which resist decomposition longer than the ground mass, leaving the rock covered with an apparent growth of black moss-like crystals. P. A. Haven, Gold Lake, Sierra County.

No. 282.—Polytellite, or silver fahlerz, more generally known as argentiferous gray copper. Cloud ledge, Flint district, Owyhee.

No. 283.—Antimonial sulphuret of silver, from Allison lode, Ryerson district, Owyhee. There are four different antimonial sulphurets of silver, one red, Pyrargyrite; and three black, containing different proportions of silver to the sulphuret of antimony, viz: *Miaryrit*, or Clinorhombic brittle silver 1 to 1; *Stephanite*, or rhombic brittle silver, 5 to 1; and *Polybasit*, or hexagonal brittle silver, 9 to 1, respectively. This is Miargyrite, being rhombic in crystallization, and giving a dark cherry-red streak.

Home Manufacture of Gunpowder.—The Mechanics' Institute Committee of gunpowder,—Messrs. Haley and Pippy,—in making their examinations, did not subject to proof the samples of powder exhibited at the Fair, but went to the different magazines, and themselves selected samples from packages destined for the trade. The various samples thus obtained, embracing sporting, cannon, musket, and blasting powder, were subjected to divers proofs, the chief of which, and that upon which they most relied, was with the "Eprouvettes" mortar, charged with one ounce of powder and a 24-pound ball.

They report that the superiority, on the whole, rested with the California Powder Works, and therefore recommend an award of a gold medal to that company, and a silver medal to the Pacific Powder Mills.

Long hair, in Paris, costs one hundred and ten francs per pound, while a short article is worth only from eighteen to twenty francs. Germany furnishes fair hair—South America, black. False white hair is most difficult to obtain. A Paris chemist has been trying to produce it from colored hair, but has hitherto only succeeded in making gray hairs.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1849, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—Chemistry and Mineralogy. 2—Civil Engineering 3—Mechanical Engineering. 4—Mining Engineering and Metallurgy. 5—Agriculture. 6—Natural History and Geology, and 7—Select Course.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

San Francisco, October 19th, 1868.

Mr. M. Hungerford—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

Office of the Oneida Mining Company, Jackson, May 13th 1868

Mr. Morgan Hungerford—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

Big Oak Flat, May 25th, 1868.—*Mr. T. W. Mulford*—Dear Sir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

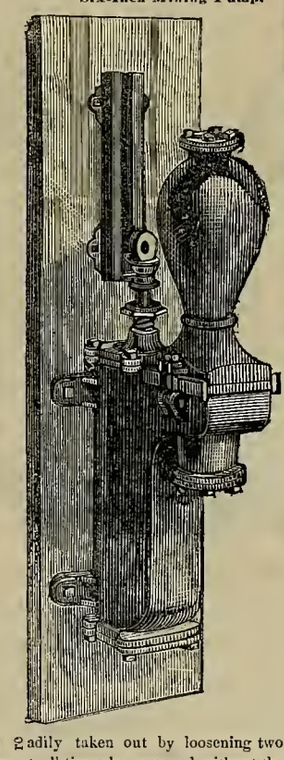
It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by Goddard & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.



Or M. HUNGERFORD, at the Pacific Iron Works.

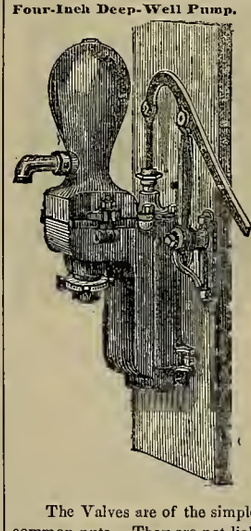
HANSBROW'S CHALLENGE

Deep-Well, Mining and Double-Cylinder Patent Pumps.



Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents, LOCKE & MONTAGUE,

☞Send for a descriptive Circular. 112 and 114 Battery Street, San Francisco.

Stock Prices—Bid and Asked.
New Incorporations.

IRIDESCENT OBJECTS themselves are devoid of color; bnt when they are subjected to the influence of white light, they absorb according to their individual characteristics one or more of the rays of one or more colors which form that light and reflect the rest, consequently any object appears of that color that results from the ray or mixture of rays which it reflects. For example, green objects ahsorb the red and reflect the yellow and blue rays; purple absorbs the yellow and reflects the yellow and blue ones. The rays so absorbed are said to be *complementary* to those which are reflected, a complementary color being always that tint which, when added to the primary color, would, upon the eye, constitute white light. The truth of the fact last stated may ho occularly demonstrated by placing any colored object in homogeneous light, such as that of an isolated portion of the spectrum. In this way a green object in the bluo rays will appear blue; if placed in the yellow ray it will appear yellow; and a white screen which has the power of reflecting all the colors, will take any tint in succession, which may be presented as the incident ray. An object of pure red, on the contrary, will appear black in any but the red ray, because it ahsorbs all the other colors as perfectly as charcoal, soot or black cloth absorbs white light or the rays of all colors.

RUSSIAN MINING INTERESTS.—Baron Von Koschkill, a geologist and mining engineer of Tiflis, Department of the Caucasus, Russia, is visiting the principal mining districts of the United States under orders from the Russian Government. He has examined the oil regions and coal fields, iron, lead and copper mines of the older States, and now proposes to examine the chief silver and gold sections of the Pacific. He will visit Twin River, Silver Bend, Hot Creek, and the White Pine region, and then come to California. A great deal of very valuable matter is collected in this manner, and is constantly in progress of publication under the auspices of the geological and other scientific societies of St. Petersburg,—in the French language. A first-class mining academy and large geological and mineralogical collections are established at St. Petersburg.

CHAS. W. FELT, of Salem, Mass., has gone to England to exhibit his type-setting machine.

Silver Ore Deposits in Dolomite.

The surest method of finding undeveloped wealth, is to know the nature of the article and the usual manner and situation of its occurrence. That silver ores do not occur in a hap-hazard way, but are governed by like conditions with like results in different parts of the world, no matter how distant these may he from each other, is a fact so well known by all who have paid the proper attention to the subject, that it should appear vain to repeat it. Yet there are many who forget that the principal ores of silver were mined and reduced two thousand years ago. We will not attempt to convince such that White Pine District is not the out-cropping of a genuine vein of erupted silver, which leads straight down to metallic baths in the earth's center—for

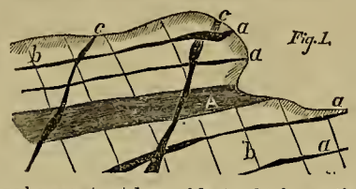

Fig. 1.

we have not yet been able to obtain a satisfactory diagram of the character of the deposits so far as opened, from individuals competent to judge and describe who have visited the ground; though we believe our last week's account furnished a correct idea of them, and it should only be added that silver glance, as well as chloride, was an important ore below the croppings.

Limestone, and dolomite (magnesian limestone, distinguishable by its being a degree harder,) have been found to be favorable matrices for the occurrence of silver veins and deposits, in many different parts of the world, especially in England and in Sweden. Even in Nevada, the method of occurrence in dolomite is not peculiar to White Pine, Hot Creek and Reveille districts appear to be about the same as White Pine, mineralogically as well as geologically.

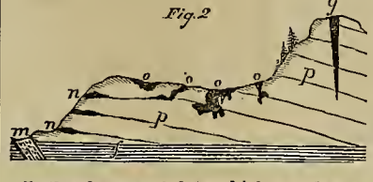

Fig. 2

In the absence of data which can be obtained only from deeper developments at White Pine, and properly illustrated by an authentic diagram, we will give an idea of the occurrences at Hot Creek and Reveille, as derived from information given to us by J. S. Phillips, M. E., who examined these districts minutely a year or more ago. Hot Creek, we are told, is in the same range of mountains as White Pine.

The limestone or dolomite p, p, is a pale bluish, dry, "ungenerous" crystalline metamorphic rock, having its strata distorted, and almost if not entirely obliterated. The silver deposits, o, o, consisting of argentiferous sulphuret of copper, silver glance, and sulphurets of silver and antimony, with croppings chiefly of chlorides, carbonates of copper, and other results of the decomposition of the foregoing, occupy curiously shaped pockets, veinlets and nests in the dolomite; q is a barren quartz vein on the summit of Pilot Knob, which can be traced down its sides, and observed to run to a point.

The locality n, n, is intended to show a variation in the character of these deposits, as seen at Reveillo District, where the pockets run in at the side of a hill, apparently along the lines of obliterated stratification, and may be called "floors"; m represents a dyke of porphyry or other eruptive rock, in which the ores are impregnated into the mass as well as occupying clefts and spaces. There are no valuable quartz ledges, our informant thinks, at Hot Creek.

An interesting comparison with the foregoing data may be made with the occurrences of lead and silver ores in Derbyshire, England. The country rock is dolomite, locally called metalliferous limestone, being geologically of the carboniferous Mountain Limestone formation, which is cleft in various directions by openings or caves, and interstratified with layers of trap ("toadstone"), A, believed by De la Beche to have been deposited as submarine lava flows. The Derbyshire miners distinguish three kinds of veins: *rake-veins*, c, c, which are true fissure veins, or filled-out cracks; *pipe-veins*, a, a, longitudinal deposits in the direction of stratification; and *flat-veins* or *skirns*, b, b, which are thinner deposits in fissures apparently like those seen in ordinary jointed structure of rocks. At the crossing of the thick vertical and the horizontal veins there are often bunches or chimneys. In the trap the veins are cramped, and the ores are worthless, the supposition being that the mineral ingredients of that rock reacted differently upon passing metalliferous solutions than was the case with the dolomite, where the metals were deposited. Besides argentiferous galena, the Derbyshire veins contain pyrites, zincblende, fluorspar, calcspar and quartz. Usually only the rake-veins, c, c, are worked. In other sections not far distant, where the dolomite is overlaid with Millstone Grit, the rake-veins are found as worthless as they are in the trap; so that mining is prosecuted only in solid beds of magnesium limestone.

In Cumberland and North Wales the circumstances are very nearly the same. Silver ores occur in dolomite or limestone also at Santander, in Spain; at Palliere, in France; at Sala, in Sweden; at Ichamserthal, in Switzerland; and at Ploscherken, in Corinthia, etc,

COST OF QUARTZ MINING IN AUSTRALIA.—Quartz that yields eight and ten dollars a ton gross, is estimated rich pay in Australia, and one and a half to two dollars a ton covers the average cost of mining, with its all its contingencies, according to the reports of government statisticians.

METEOR AHOY!—The great "Bolide" of Warsaw exploded fifty miles from the earth, and was supposed to possess a surface of two thousand acres. When first seen it appeared half as large as the moon, and never appeared larger until it struck our atmosphere and exploded. What was the cause of the explosion, and especially of an explosion so complete as to almost triturate the particles? Was it the density of the earth's atmosphere that broke it, or was the explosion due to the contact of certain gases of the meteor with the constituents of the air? Our atmosphere, at any rate, it would seem, may serve as a cuirass to the earth, to protect us from stray globes like that of Warsaw. The shock and the spring of the air must have counteracted, for it did not knock people down, or very perceptibly jar the houses.

The hight of a meteor above the earth can be very approximately ascertained by off-hand observations, taken by two individuals stationed some distance apart at the same instant, which is easily determined by the explosion; and the principle is ordinary triangulation, wherein the distance apart is the base. A vast extent of country was covered by fractions of this meteor—which certainly belonged, like all other meteors, to another sphere or center of gravitation than our own, whatever may have been the condition of its neighboring particles, whether gaseous, fused, or solid—because meteorites are a different combination of metals from anything known to belong "under the sun." It is believed that asteroids and other cosmical bodies, down to meteors in size, and "cosmical dust," of which the Germans are philosophizing, may be diffused through space much more extensively than we can be made aware of by vision, for obvious reasons. In regard to meteors, the same old problem is given to us which has been solved ten thousand times in equally difficult cases—to prove to our satisfaction and to a certainty the existence of that which we do not see with our eyes.

THE STATE TREASURER'S SAFE.—A very large Monitor safe, built with special view to security against burglars, was shipped a few days since to Sacramento. It is designed for the State Treasurer's office, and was put up at the Phœnix Iron Works, (Nos. 18 and 20 Fremont street,) at a cost of $3,600. It is constructed of alternate plates of 5-16-inch boiler iron and hardened steel. The bolts and rivets are headed on the inside, driven from the inside outwards while hot, and very firmly imbedded in the plates. The lock used is the well known Isham patent key register lock. There are twelve polished steel bolts on the inside of the doors, which fasten them when closed as firmly as the sides of the safe itself. These bolts, all thrown as they are by a crank on the outside, equal distances and at different angles, with the least possible degree of friction, show an accuracy of movement and a beauty of mechanism which are a credit to all concerned.

Lecture on Chemical Geology.

[Delivered before the Fellows of the Chemical Society, London, February 20, 1868.]

BY DAVID FORBES, F.R.S., ETC.

[Concluded from page 274.]

On the other hand, as it is admitted that the presence of water has had some share in igneous action in nature, and that many minerals found in plutonic rocks do contain small amounts of water, either entangled under pressure or in a state of chemical combination, it is advanced that this could not be the case if the igneous matter had really come from any receptacle or reservoir in the interior of the earth, since no water could reach such sources.

The very emission of vapor and the presence of water in some volcanic minerals proves that the water really had got down by some means, and I see no difficulty in accounting for the infiltration of water when the effects of capillary action and heat are taken into consideration. An excellent illustration of how this may be effected is afforded by a glance at the action of an ordinary Gifford's injector, so commonly used to force the water supply into high pressure boilers, in which case the very pressure, which under ordinary circumstances would prevent the entrance of the water, becomes actually the means of forcing it in.

Before concluding, I would, however, add a few words on a subject, which may almost be called the "bete noire," of geologists, namely, "metamorphic action," the study of which, intricate enough in itself, appears to have been rendered still more difficult and perplexing by the constant attempts to bring all the phenomena under one head, or in other words to ascribe to the action of one cause, results which are doubtless due to many very different agencies.

The study of metamorphism offers a wide field for exploration, especially to the chemist and microscopist—for the microscope is an indispensable instrument in these researches. Much however remains to be done, for but little is as yet satisfactorily demonstrated, and very many points of importance are still extremely obscure.

The results of metamorphic action are so varied and numerous, that the first step required seemed to me to be an attempt to classify the facts under the heads of the causes which are imagined to have influenced them.

A rough attempt resulted in the formation of six different classes:

1. By pressure alone.—Alterations by compression and induration, often inducing cleavage, as in clay-slates. This metamorphic change is truly mechanical, but occasionly a slight amount of chemical change (combination apparently) has taken place, which possibly might have arisen from the indirect conversion of mechanical into chemical action.

2. By heat alone.—Many soft beds, like shales and clays become strongly indurated and converted into porcellanite and similar products, in near contact with basaltic dykes, etc. The microscopic and chemical examination shows that, beyond the mere expulsion of the water, the change is similar to the baking of stone ware; such rocks *in situ* are found to be generally more compact from being at the same time subjected to more or less pressure.

3. By heat in conjunction with chemical action and crystallization.—When in the last-mentioned case, the rock may contain substances which might unite with one another to form new compounds, this is frequently found to have taken place. Thus, if a calcareous and ferruginous shale or clay be subjected to a heat much below fusion, whether in nature or artificially, we have a complete change in its appearance and mineral composition, produced by the recombination of its constituents, and the formation of new minerals, such as, for example, epidote and garnet, both of which are silicates of alumina, iron, and lime. These reactions explain how extremely common it is to find such minerals developed in the rocks at the point of contact with igneous eruptions, as most of the sedimentary rocks contain the constituents silica, alumina, lime, and sesquioxide of iron which enter into their composition.

When in these cases, pressure constant, but not necessarily great, is also brought into play, we may produce artificially most striking results, as will be seen by examination of the specimens here exhibited, which show the conversion of ordinary clay slates, some of them slightly chloritic and micaceous, into a rock much resembling some natural schistose, or gneissic rocks.

These were produced by keeping the rocks exposed to a heat below their softening point for several months, whilst they were protected from oxidation and subjected to a pressure varying from about 77 pounds to 15 pounds per square inch. If fusion or softening takes place, all structure is not only at once obliterated, but new reactions are called into play, resulting in the production of quite different chemical compounds in the fused product. The parallel structure was found to become developed at right angles to the pressure, or in other words, in the lines of least resistance in the rock.

Another specimen of rock shows the effect of similar treatment upon a block of compact soapstone, which, as will be seen, has been greatly changed in appearance, now possessing a finely developed foliated structure, with large crystalline plates or leaves. In this case it is probable that the effects are entirely due to recrystallization; and to a similar cause may be attributed the formation of many of the metamorphic crystalline limestones and marbles, when the contact with igneous eruptions may have heated them sufficiently to bring about such molecular changes.

4. By aqueous action, either inducing crystallization, by introducing or dissolving out certain mineral substances, by forming hydrated compounds with others, or by effecting chemical changes through the agency of the gases or solids, or both, held in solution by the water, all of which effects may be more or less assisted by heat and pressure.

The simplest example of this action is seen in the destruction and obliteration of the structure of organic limestone, which may thus be converted into crystalline rock, showing no trace of their original origin. Thus can be explained the veins of crystallized calcite which are found in modern coral reefs. Infiltration of water holding carbonate of lime in solution will account for the formation of calcareous sandstones, grits and tuffs, and the filling up of the pores of many vesicular rocks and lavas with carbonate of lime, whilst the reverse effects would follow from such rocks being subject to the action of waters which could dissolve out such bodies previously existing in the pores of rocks. Certain zeolites or hydrated silicates in rocks may have been formed by the water entering into chemical combination with previously anhydrous silicates, and on the table is seen a specimen of the noted example of this action from the ancient Roman aqueduct at Plombiéres. Again by the chemical reactions between the constituents of the rock and the compounds held in solution in waters which infiltrate into and permeate through rock masses, great changes may be effected. Many of the magnesian limestones and dolomites appear to have been thus formed, from limestones of true organic origin, by the action of solutions containing magnesia. Other similar limestones have been converted into ironstones by the analogous reactions with solutions containing iron, as in the case of the Cleveland ironstones; and these effects would naturally vary with the chemical nature of the agent held in solution by the water.

5. By gasolytic action. The action of vapors and gases, at times strongly acid, as seen in solfataras and fumeroles, has also frequently played an important part in affecting metamorphic changes, both by the decomposition and reconstruction of rocks; by such means we often find limestone converted into gypsum, deposits of kaolin and clays formed from the decomposition of feldspathic rocks, etc.; and many of the compounds of boracic acid appear also to have been derived from such sources.

6. By a combination of two or more of the above agencies. In the study of the physical and chemical geological of the older and more characteristic metamorphic deposits, all the above agencies appear to have combined (if not at once, at least at different times,) to produce the extraordinary and varied appearances which are now visible in these rock formations.

Many of the mica schists appear to have been originally mere micaceous sandstones, such as are now found in the later formations, subsequently recrystallized, probably by the long-continued action of a gentle heat, causing the particles to expand, and permitting a molecular movement, whilst the combined effect of pressure gave the direction to them, and caused the lines of foliation and rearrangement of the particles to take place. The quartzites in part appear to have been mere sandstones, recrystallized and indurated by similar causes, whilst others appear to be sandstones or grits, the particles of which have been cemented together by a minute quantity of gelatinous silica, produced from the decomposition of feldspars originally associated with them, and this mass consolidated by pressure, assisted or not by heat—a result very analogous to the formation of Ransome's patent stone.

Much of the gneiss appears to be the result of a stratified reconsolidation of the matter derived from sub-aqueous or sub-aerial granite outbursts, such as I have previously alluded to, whilst another species of gneiss, granite gneiss, or gneiss granite, appears (as I in 1854 described in the case of many Norwegian rocks) to have resulted from true granite eruptions, in which the foliated or parallel structure has been subsequently induced by a re-arrangement of the mineral molecules in the solid mass, very possibly effected by the long-continued action of moderate heat and pressure, as in the case of the artificial specimens on the table before us.

Although I admit that what has been termed hydrothermal action has taken part in these metamorphic changes, and that this action may have been much assisted by the alkaline or other matter in the water, I am not inclined to consider either hydrothermal action, or the view that the methamorphic rocks have been formed from ordinary strata, softened and brought into a pasty state by the combined effects of enormous pressure, heat, and water (a sort of *Papin's digester* process), as the grand cause of the metamorphism of rocks.

The results of experimental research, on the contrary, show that in order to imitate such effects, the heat must be so low as to prevent any softening or fusion; that the pressure need be but very moderate, but must be constant; that oxidation must be guarded against;* and that time is a most important element in all these changes.

The examination of natural metamorphic rocks by the microscope further leads to the deduction that the water present in these rocks has in all probability been derived from the water originally present in the unaltered stratum; and we know that all beds of aqueous deposition invariably contain more or less water; further, that the arrangement of the particles and crystallization of the rock is compatible only with the view that the metamorphism had been effected whilst the rock itself was in a solid condition.

I have therefore come to the conclusion that the great metamorphic changes seen in the older strata have, in the main, been effected whilst these rocks were in a perfectly solid condition, by what may be termed molecular-chemical action, *i. e.*, a combination of chemical force and molecular movement, which may have been brought into activity by any one or more of the previously described agencies.

In concluding this necessarily very incomplete sketch, in which I have endeavored to touch upon the most prominent points of chemical geology, I would add that I believe that many, if not all, of the views which I have adopted, so far from being new, have long ago been enunciated by other observers. My labors have consisted in examining into their soundness, and attempting to build up a whole by the agglomeration of what might be termed "disassociated" data; and throughout this lecture I have attempted, as far as possible, to support my views by reference to facts and experiments in preference to the opinions of authorities.

Although, from its very nature, some parts of such a sketch must be necessarily extremely theoretical, yet I believe the Society will support me in considering that the interests of science may be benefited by occasionally attempting to bring an accumulation of facts under some theoretical, but systematic, arrangement, even if this be but regarded as temporary, and found subsequently to require much modification by the advance of our knowledge of the subject; and in now bringing forward this summary of my investigations on the subject, I may state that I am fully prepared to reject such points as may be proved to be unsound, my object being the elimination of truth, and not the defence of any opinions which notwithstanding that I now hold to be correct, may possibly be hereafter shown to be untenable.

* In nature the supposition that the rocks when metamorphosed were below the ocean, or under superincumbent strata, would account both for their protection from oxidation, and for the required pressure.

SEWERAGE CONCENTRATED AND UTILIZED. An English paper says that Messrs. Robert G. Sillar and George W. Wigner, have recently patented a new compound, consisting of animal charcoal, blood, clay, alum, and certain other materials, which is stated to possess the power of precipitating nearly all the manurial matter of the sewer water, "the precipitate settling in a flocculent mass, and the residuum requiring only to be dried and treated with a simple acid to render soluble certain of the constituents for the use of plants."

Five hundred horses have been brought to California this season, from Oregon, and sold at a great profit.

Prevention of Boiler Explosions.

A paper was read by L. E. Fletcher, C. E., before the British Association at Norwich, suggesting that Coroners' inquests properly conducted would be more effective toward the prevention of boiler explosions than Government Inspection. We condense as follows:

At the inquiries conducted by coroners as to the cause of explosions, the public naturally look for all the facts of the case to be brought out, so that they may not only be informed that so many poor fellows have been blown to death, and so much property damaged, but also instructed as to the true cause of the catastrophe. These hopes are, however, as a rule, disappointed. The public are misguided rather than instructed, and instead of any practical suggestions being given for the prevention of similar disasters, they are generally stated to be perfectly unaccountable and accidental, that no one is to blame, and that nothing could have prevented the catastrophe. The evidence admitted is of the most absurd and frivolous character. In many cases, witnesses are adduced to prove that the exploded boiler was a thoroughly sound one and perfectly safe at the pressure at which it was worked. On one occasion, a witness attributed the explosion to wind in the pipes, produced by lifting the safety-valves; on another, to the formation of an explosive gas within the boiler, which had become ignited through a crack in the plates. Many other cases show the character of evidence too frequently given.

There are, however, a few exceptions. An explosion occurred in this city about two years since, killing seven persons and laying the premises in ruins. The cause was simply that the boiler was a bad one, though new and made under special contract. This the jury plainly stated in their verdict; and the maker of the boiler had to pay damages to the amount of £2,000. A few such verdicts would shortly rid the country of boiler explosions.

Let every coroner be empowered to call in two competent engineers to investigate the cause of the explosion, and report to the jury thereon; these engineers to visit the scene of the explosion, examine the fragments of the boiler, attend the inquest, hear the evidence, aid the coroner in conducting the inquiry, report to him, and accompany their report with suitable scaled drawings of the exploded boiler, showing its original construction, and the lines of fracture, as well as the flight of the parts as far as they can be ascertained. The inquest to be open to the public and to the press. A full account of the inquiry, including the reports, accompanied with the drawings, to be printed and deposited at the "patent office," and to be accessible both to the purchase and inspection of the public, as is the case with the specifications of patents. Also a report of each inquiry to be sent to the members of both Houses of Parliament, as issued.

The frequency of boiler explosions has been used as a plea for a Government system of compulsory inspection. There are, however, objections to this course. Such a system must be carried on by rule, and, however wisely such rules might be framed, and however liberally carried out, it would be impossible to prevent its proving a harass to the steam-user, and an impediment to progress. But by confining Government action to investigations by coroners' juries, the steam-user would be left perfectly free as regards the management of his boilers, but would be held responsible for results.

SUBSIDING.—The evidences that Southern New Jersey is sinking into the sea, are that the tide mills lose an inch of head every ten years, in consequence of the rising of low water mark, and that the sea is perceptibly advancing towards houses and other fixed objects. The grandfather of Aaron Leamiug was buried in 1694, at Townbank, in a graveyard a short distance inside of the town. In 1734 the graves were about fifty rods from the shore, and ruins from the houses were apparent. Now the graveyard has been all washed away, and at dead low water mark, the marks of three walls, remnants of the town built between the shore and the graveyard, can be seen. Mr. Price, a surveyor in the vicinity, says his lines are shorter by forty or fifty rods than they were in 1776.

AN Ohioan has invented a car brake which acts directly on the axle, instead of the wheel. It is asserted that it will, by a quarter turn of the brakeman's wheel, bring a car to dead lock.

Mechanical.

Uniform Standard for Bolts and Nuts.—In May last we announced the appointment of a board of naval officers by the Secretary of the Navy, to examine and report upon the different kinds and sizes of screw-threads in use,—with a view to the adoption of some uniform plan. This board duly reported, after having visited the principal machinery establishments in the United States; their report has been adopted, and the plan recommended by them made the standard of the U. S. naval service. It is that of Sellers, of Philadelphia.

The form of thread is a V, with an inclination of 60°; the top and bottom flattened equal to one-eighth of the pitch. The following table of the number of threads and the diameter of bolts, is from the *Scientific American:*

Diam. of bolt.	No. of threads.	Diam. of bolt.	No. of threads.
¼	20	2	4½
5-16	18	2¼	4½
⅜	16	2½	4
7-16	14	2¾	4
½	13	3	3½
9-16	12	3¼	3½
⅝	11	3½	3½
¾	10	3¾	3
⅞	9	4	3
1	8	4¼	2⅞
1⅛	7	4½	2¾
1¼	7	4¾	2⅝
1⅜	6	5	2⅝
1½	6	5¼	2⅝
1⅝	5½	5½	2½
1¾	5	5¾	2⅜
1⅞	5	6	2¼

The board, in concluding their report, say: "So far as we have been able to confer with engineers and manufacturers, we have heard but one opinion expressed in regard to the importance of uniformity of practice. Many have already adopted the the Sellers pitch; others are gradually adopting it, while others still express their willingness to adopt it. A majority, we confidently believe, are now willing to adopt the Sellers *form* of thread also, provided it be made the standard.

"As a proper auxiliary we suggest the importance of having all necessary gauges manufactured by a single establishment, as by that means only can entire uniformity be secured."

Platinum Coating on Brass.—Böttger makes a nearly neutral solution of chloride of platinum by carefully adding carbonate of soda to the acid solution as long as there is effervescence. To this solution he adds a little glucose and some chloride of sodium, without which latter the platinum would be deposited black. The articles to be coated have only to be immersed in this mixture; but when it is wished to coat a number of small objects,—pins, for example,—it is recommended to place them in a sort of zinc sieve, and immerse the whole in the solution, heated to about one hundred and sixty degrees Fahrenheit. The coating of platinum is deposited almost instantaneously, and the articles have then only to be well washed and dried in warm sawdust.

Electric Clock.—A new electric clock is now on exhibition in New York. The *Artisan* says of it: This clock, like most if not all of the electric clocks heretofore constructed, is set in motion through the pendulum; but, instead of the pendulum being alternately attracted in opposite directions by means of two electro-magnets acting on armatures in connection with it, is alternately *repelled* in opposite directions by the action of two stationary galvanometer coils upon polarized steel bars firmly inserted through the pendulum-bob; the current from a galvanic battery being charged from one coil to the other alternately, by means of a circuit-changer attached to the pendulum.

Bronzing Copper-coated Iron.—Weiskopf also gives a process for communicating to objects of art coppered by his plan the appearance of antique bronzes. For this purpose he brushes the articles over with a solution composed of four parts of sal-ammoniac, one part of oxalic acid, one part of acetic acid, and thirty parts of water. The application is to be repeated until the article assume the desired color.

Cutting and Planing Stone.—S. W. Robinson, C. E., contributes a paper upon this subject to the *Journal of the Franklin Institute*, for September. After alluding to the difficulty of dressing stone by machinery, owing to the destruction of tools by the "grit," he thus speaks of two machines which have been tried:

Near the eastern portal of the Hoosac Tunnel, in Massachusetts, may be seen a hole about 16 feet deep, horizontally, and 24 feet in diameter, which was bored into the solid talcose slate of the Hoosac Mountain by an immense tunneling machine in the earlier days of the present Hoosac Tunnel enterprise. The surface of the rock, as left by this remarkable machine, is as smooth as though dressed to an even cylindrical surface by masons' chisels. The machine which did this work was provided with revolving cutters, the axes of which were set diagonally to the path of their motion, so that the cutting was due partly to the rolling contact, and partly to slip. This machine was unsuccessful, as is shown by the fact that it was intended to bore through the mountain, but only made about 16 feet advance before being abandoned on account of the expenditure of one set of the circular cutters, which were very costly. A tunneling machine was tried in England which cut its way 80 feet into rock, but was not regarded as successful.

At Lemont, Ill., may be seen a massive planer, constructed of iron, on which immense flagging and facing stone are planed to a remarkable degree of smoothness, presenting, in fact, almost a polished surface. The stone thus treated is limestone. It is planed in a manner similar to that of planing iron. A series of cutting tools is fixed, under which the stone moves to and fro with a great degree of power and steadiness, the cutters taking off shaving after shaving until the desired surface is obtained. A very slow speed is required in order to preserve the cutting edges of the tools for any considerable length of time, but this stone having less grit than many kinds, it is susceptible of being reduced by skillful management."

Coppering Iron.—We gave last week a method of coating iron with copper without a battery. We here give another plan, devised by Weiskopf. The article to be coated is first brushed over with a solution made by dissolving one part of nitrate of copper in fifty parts of hydro-chloric acid; and afterwards with a second solution made of ten parts of nitrate of copper, ten parts of chloride of copper, and eighty parts of hydro-chloric acid. This latter solution is applied very quickly with a soft brush. The copper is deposited in a few seconds, and the object must be rinsed immediately in cold water and wiped with a soft cloth. By repeating the application of this second solution the copper coating may be obtained of any desired thickness. The coating is said to be very durable.

Mica Powder for Lining Safes.—Mica is one of the worst conductors of heat we are acquainted with. For this reason mica powder is recommended for filling in the walls of fire-proof safes. Any one,—says a writer in *Dingler's Journal*,—wishing to assure himself of its value for this purpose, can do so by taking a cast-iron tube 2 or 3 inches in diameter, placing a roll of paper in the center, filling up the space between the paper and the walls of the tube with the mica powder, and, after well closing the ends, throwing it into a furnace and keeping it red-hot for some time. When the tube is reopened after this, the paper will be found quite uninjured by the heat.

Large Steel Boilers.—Mr. Daniel Adamson, of the Newton Moor Iron-works, Hyde, England, is making some very large Bessemer steel boilers for a sugar bakery in London. They are intended to work at 100 lbs. steam pressure, and are eight feet in diameter and formed of 7-16-inch plates. Each ring is formed of a single plate, 26 feet 6 inches long and 3 feet 6 inches wide, giving but a single longitudinal seam. The rivet-holes are drilled.

Large Belt.—A leather belt 163 foot long, 30 inches wide, and weighing 800 pounds, has just been made for a new elevator in Buffalo. Its cost was $1,630.

Scientific Miscellany.

The Calaveras Skull, etc.

During the last two days of the session of the American Association for the Advancement of Science at Chicago, the question of the genuine character, as a fossil, of the skull found in Calaveras County, Cal., was discussed at some length. Prof. Silliman said that he had spent considerable time in the examination of the region about Jamestown, in Tuolumne County, and that so far as had come to his knowledge, there was no fossil evidence of the existence of man either in the form of bones or of handiwork. He exhibited the molar tooth of a mastodon, found in February last under Table Mountain, 4¼ feet above the bed-rock, in non-auriferous gravel, and said that if that formation was Miocene Tertiary, it puts the mastodon in America back to the date at which it has been found in India; but that whatever its age, there was no evidence of the contemporaneous existence of man. He thought the evidence in favor of the authenticity of the skull presented by Prof. Whitney, perhaps favorable to the opinion that it is a true find, and that it should have the benefit of the doubt; but that possibly Dr. Jones, who had a hand in the transmission of the bones, was somewhat credulous.

Prof. Blake withdrew the evidence which he had presented of the human relics found under Table Mountain, and which was discredited until he had an opportunity for further investigation; saying, however, that Dr. Snell, from whom his information was derived, was a man of good reputation, and one who could have no object in misrepresenting facts. He dissented from the opinion that the Table Mountain deposits were as old as the miocene division of the Tertiary, and considered the occurrence of the mastodon as evidence to the contrary.

During the closing day of the session, Prof. Blake referred to the skull shown by Prof. Whitney. His remarks are thus reported in the *American Journal of Mining:*

"In speaking of this relic, he wished that his motives would not be misunderstood. Until after the close of his remarks on the the preceding day, he had never had an opportunity of examining that skull. In a case of this kind, the public was entitled to have all the evidence of fact that was attainable. This fragment of a skull from the shaft in Calaveras County, was not water-worn or rubbed by attrition in the bed of the stream or elsewhere; the edges were sharp and angular, and the presence of other bones and of a fragment of shell evidently used as an ornament, crowded into the base of the skull, also indicated that the skull had not been rolled in the drift, but the appearances rather indicate it to be the remains of an Indian grave. He had heard the statement made in California, that the bone of a bird was found cemented to the skull; and he had only just heard that in cleaning the piece of the skull from earth and gravel, the shell of a snail was found, identical with the species now existing in that county. Such shells were very light and fragile, and it was difficult to conceive how it could have been rolled and tumbled, and forced into the position in which it was sound, without having been entirely destroyed; indeed, its presence was good evidence that the skull had not been drifted or washed into the gravel bed."

Prof. Andrews followed, expressing great doubt about the authenticity of the skull; believing that it had been placed in the shaft where it was found.

Mr. Grimes thought there might be some mistake about that skull. Naturalists who had discussed the antiquity of man had made an argument from the shape of the skull,—as indicating inferiority of character. But one thing was certain; the skull exhibited by Prof. Whitney, in its formation, indicated rather a superior character. According to its position it ought to be one of the first created, but if that was the form of the first created man on this earth, then, instead of mankind progressing, he has degenerated considerably, for, if there was anything in craniological science, that individual was superior to the majority of those present. [Laughter.]

Ants.—We condense the following notice of one of the most remarkable genera of the *Formicaria*, from Dr. Packard's new work on entomology, elsewhere noticed in this issue of the Press. The intelligence of the *Œcodoma* is wonderful. They understand the law of the division of labor. They are seen in immense numbers transporting leaves, from the foot of the tree to the nest, while other troops, which have climbed the tree, occupy themselves solely in cutting off the said leaves and dropping them. The leaves most relished by them are precisely those of the most useful trees; they are consequently a veritable scourge to agriculture. Everywhere, in desert places as well as in the neighborhood of habitations, columns of these insects are met, busily occupied in the transportation of leaves. "The *Œcodoma cephalotes*",—says H. W. Bates,—"from its immense numbers, eternal industry, and plundering propensities, becomes one of the most important animals of Brazil." Rev. Hamlet Clark says of another species of this genus, the *Œ. sexdentata*, that the proprietor of a plantation used every means to exterminate these pests, but failed. In a single night they would strip orange and lemon trees of their leaves. A ditch of water around the garden, which effectually excludes all other ants, was of no use. They would run a tunnel directly under its bed. It is said, indeed, that a column has been known, in its progress through the country, to undermine the great river Paraiba. The *Œcodoma Texana* has been known to dig wells for water twelve inches in diameter, and thirty feet deep.

Australian Fossils.—A quantity of fossil bones recently discovered at Wallaroo, have been pronounced by Mr. Waterhouse, curator of the South Australian Museum, to be those of the *Diprotodon Australis*. This is a kangaroo-like quadruped which Prof. Owen describes as having had a head some three feet in length; and as exhibiting remarkable modifications of its limbs. "The hind pair were much shortened and strengthened compared with those of the kangaroo; the fore pair were lengthened as well as strengthened; yet, as in the case of the megatherium, the ulna and radius were maintained free, and so articulated as to give the fore paw the rotary actions. These in Diprodoton would be needed, as in the herbivorous kangaroo, by the economy of the marsupial pouch." At present only one species of this genus is known; and it is conjectured that the animal lived in the pleistocene period. Numerous remains of this animal have been found in the most recent geological formations in Queensland, New South Wales, and South Australia.—*Dicker's Mining Record.*

Electricity and Photographic Plates. M. Becquerel finds that chloride and bromide of silver deposited on plates of platinum, when acted upon by light, give rise to a strong current of positive electricity, which is just the reverse of the current afforded by the platinum plate alone. Now the chloride and bromide of silver are actually decomposed by light—yet the bromide indicates a current of higher intensity than the former. The conclusion is, that a similar action takes place when the light acts on the chloride and on the bromide of silver, viz., reduction to a subchloride and subbromide respectively. On applying this test to the iodide of silver, it was found that it likewise gave rise to a current of positive electricity under the influence of light. The inference is that iodide of silver is reduced to a subiodide, just as the chloride is to a subchloride, and the bromide to its lower state of combination.—*British Jour. of Photography.*

Motion of the Stars Measured by the Spectroscope.—Mr. Huggins has thus measured the approach or recession of a star towards or from an observer. A ray of light undergoes refraction in proportion to its wave length. The short violet waves are more refracted than the longer red ones. Now if the observer is carried towards a star by its motion, or by that of the earth, the apparent length of the waves will be diminished, and they will be more refracted; but the reverse if the motion is in the opposite direction. The lines of the spectrum are displaced by these changes; and by calculations made accordingly, Mr. H. finds that the nebulæ are not appreciably changing their distance from the earth, and also that Sirus is approaching us at the rate of 29¼ miles per second.

[Written for the Mining and Scientific Press.]

Action of Sulphuric Acid on Sugar and other Organic Bodies.

BY EDWARD PIQUE.

EDITORS PRESS:—It is known that there are two different kinds of sugar. One kind, obtained from sugar cane, beets, maple trees, etc., appears in beautiful crystals and polarizes, the light to the right; while the other kind, which is contained in the juice of grapes, apples, pears, plums, in honey, etc., and may also be prepared by boiling starch or vegetable fiber with diluted sulphuric acid, hardly ever appears in clearly defined crystals; they have a different form from the others, and polarize the light to the left. The latter is greatly inferior to the first in regard to its appearance, and likewise the sweetening power, requiring at least double the quantity of starch sugar to produce the same effect as cane sugar. It would certainly be a great desideratum if starch sugar, which is so much cheaper, could be changed into cane sugar. This has never yet been accomplished.

If we boil cane sugar with dilute sulphuric acid, it is converted into fruit sugar; but after this change has taken place we are not able to change it back into cane sugar.

The sulphuric acid exerts a similar power on some other organic bodies. For instance, *indigo*, by proper treatment, will dye different fabrics a durable blue, so that neither the light of the sun nor washing with soap will have any effect on the color; but after dissolving the indigo in concentrated sulphuric acid, we obtain a blue pigment, called *coerulin*, which will stand neither the sunlight nor the action of alkaline solutions, and we are not able to change the coerulin back into indigo blue.

With the view of ascertaining whether fruit sugar could be converted into cane sugar, I examined the change produced by the sulphuric acid. Now, it is well known that the sulphuric acid has a great affinity for water, and in consequence of this property not only deprives other bodies of the water that forms a part of their chemical constitution, but even causes the hydrogen and oxygen contained in those bodies to unite, in order to connect itself with the water so formed. We would naturally come to the conclusion that these bodies, after having been treated with sulphuric acid, should contain less water, or less hydrogen and oxygen, in the proportion of water, than they originally contained; but we are astonished to find just the contrary result.

Cane sugar consists of 12 equivalents carbon+20 hydrogen+10 oxygen+1 water.

Fruit sugar consists of 12 equivalents carbon+24 hydrogen+12 oxygen+2 water.

Indigo blue consists of 16 equivalents carbon+2 nitrogen+10 hydrogen+2 oxygen.

Coerulin consists of 16 equivalents carbon+2 nitrogen+18 hydrogen+6 oxygen.

This calculation shows that fruit sugar contains 3 equivalents of water more than the cane sugar, and coerulin 4 equivalents of water more than the indigo blue.

How can we explain this contradiction? My opinion is that sulphuric acid certainly does not possess the power to impart to other bodies a larger amount of water in their constitution, but rather deprives them of a certain quantity of water, changing their original composition, and that these bodies, after that change has taken place, possess a greater affinity for water, which they consequently appropriate to themselves, as soon as it is offered. As a proof of the correctness of my opinion, I wish to mention that *heat* by itself produces nearly the same effect as sulphuric acid. A certain degree of heat changes cane sugar likewise into fruit sugar, and a great many organic substances, after being exposed to a certain degree of heat, will lose some of the water belonging to their constitution; and if the heat be raised to a somewhat higher degree, they will part with some of their hydrogen and oxygen in the proportion of—and combine to form—water. After this change has taken place, those substances will always show a greater affinity toward water than they possessed before, and will appropriate the same if offered; forming a compound in which we shall find a larger number of equivalents of water, or hydrogen and oxygen in the same proportion.

Would it not be possible to find some other chemical agent, that would convert starch into sugar, without possessing the deteriorating influence of the sulphuric acid?

The chemical composition of starch being 12 equivalents of carbon+20 of hydrogen+10 of oxygen, starch and crystallized sugar are seen to have the same composition; but the crystallized sugar contains one more atom of water. If this one atom by some means could be added, we might arrive at the desired result.

Another point worth considering is the following: It is quite natural for concentrated sulphuric acid to deprive other bodies of a certain quantity of water, since having a great affinity for water it endeavors to appropriate the same, to form a hydrate; but why sulphuric acid, after having been diluted with from forty to sixty times its weight of water, as is done in the starch sugar manufactories, should still possess the same water-depriving influence, is more than I can account for.

Nevada Minerals.

The following list of minerals occurring in the mines of the Reese River District, Nevada, was arranged according to Dana's classification (chemical), by Eugene N. Riotte, M.E., of Austin, and published in Ross Browne's report. It is valuable because the Reese River minerals, so far as brought to light, may be taken as representative of the silver mineralogy of the interior regions in general:

I. NATIVE ELEMENTS: Native gold, native silver, native copper.

II. SULPHURETS, ARSENIURETS, ETC.: I. *Binary compounds.* 1. Stibnite, antimonglance. 2. Silverglanze; erubescite, variegated copper ore; galena, blende, copper glance, stromeierite, pyrites, lucopyrites, molybdenite. II. *Double binary compounds.* Chalcopyrite, pyrargyrite, proustite, tetrahedrite, polybasite, stephanite, fireblende.

III. FLOURIDS, CHLORIDS, BROMIDS, IODIDS. I. *Binary compounds.* Common salt, kerargyrite, bromyrite, jodyrite. (?)

IV. OXYGEN COMPOUNDS. I. *Oxide binary compounds.* I. Red copper, magnetic iron ore, hematite, housmanite, pyrolusite, psilomelan, wad, quartz, opal. II. *Salts double binary compounds*: Pyroxene, rhodonite, silicate of manganese; hornblende, muscovite, feldspar, oligoclas and orthoclas, tourmaline, chrysocolla; hubnerite, tungstate of manganese; barytes, gypsum, cyanosite, copperas, glauber salts, apatite, nitre, calcite, carbonate of manganese, chalybite, spathic iron ore, cerusite, trona, malachite, asnrite, titanite, tungstate of lead.

THE WORLD'S HIGHWAY.—At first glance it would seem a nice question whether San Francisco and the Pacific Railroad can put in the best bid for the Australian-European travel and light freighting, and take the prize from the Panama, Suez, and Cape of Good Hope steamer routes. San Francisco lies 900 miles nearer to Melbourne than Panama does, making a difference in our favor of four days, at least. But there are other additional reasons that will induce all Australians to travel this route who can afford to pay a little more. From Shanghai the distance to London, via Suez, is 2,100 miles greater, and from Yokohama it is 4,000 miles greater than via San Francisco.

In 1869 we shall have an Australian steamship line—and a great deal more that we do not dream of. The celebration of the opening of these "great circle" communications, will be the grandest triumph of this age in its own specialty of locomotion and transportation. Though capitalists and monopolists do great things, they will not control everything. It is a world triumph, in which we are all concerned, and of which our entire population of brave adventurers and explorers must share the benefits.

REFRESHING.—The late showers have laid the dust of our streets and purified the atmosphere. At Woodward's, the grass plats appear as gay, as fresh and green as they are in April or May. *

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & CO., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING OCTOBER 20TH, 1868.

83,153.—IMPROVEMENT IN BILLIARD TABLES. Karl Gudenoge, San Francisco, Cal.:

I claim the construction of a billiard table by the arrangement of the longitudinal slats a, a, transverse slats b, b, longitudinal rails c, c, c, and alternate wide boards or pieces d, d, d, placed edgewise and held by the transverse bars e, e, e, or equivalents, substantially as and for the purpose described, in combination with the papier maché or pasteboard bed A, applied and prepared as specified.

This invention is designed to reduce the cost of billiard tables, so that this fascinating game can be more generally introduced. The necessity of an absolute plane which must also be perfectly horizontal, has led to the employment of marble and slate heretofore for beds, and their first cost is great, while they are heavy and unwieldy. In this device a series of longitudinal slats of wood are first placed, and these are crossed by another series transversely. Two other series of slats are placed on these first, and the whole firmly united, forming a solid frame which will not warp. A bed of pasteboard in layers, or of papier maché is then glued or otherwise united to this frame, and its surface polished, after which it may be covered as usual, forming a very permanent table.

83,158.—IMPROVEMENT IN SEWING MACHINE. Frank A. Hill, Marysville, Cal.:

I claim the frame A, provided with the shares or teeth H, in combination with seed box D, provided with the toothed shafts E, E, rotated in opposite directions from the wheels B, B, and also provided with the fixed and adjustable perforated plates *e*, *e*, all arranged to operate in the manner substantially as and for the purpose set forth.

83,221.—IMPROVED ORE SEPARATOR AND CONCENTRATOR.—Richard D. Symons, John T. Harry and Samuel Stephens, Grass Valley, Cal.:

1. We claim in combination with the pan or tub A, and chamber H, the yoke B, provided with stirrers or agitators D, D, D′, and annular ring D, or their equivalents, substantially as and for the purpose described.

2. The hollow vertical shaft F′, and driving shaft F, with a half round opening in which the half-round depending spindle E, of the yoke sets, substantially as described for the purposes set forth.

3. The pins L, L, on the gear I, I′, which operate the hammer, the weighted arm M, M, and the hammers N, N, the whole constructed and arranged to operate substantially as and for the purpose described.

The present invention is one of the many which the necessities and peculiarities of California mining have brought forth. The large proportion of sulphurets, fine gold, amalgam, etc., which would be carried off and lost after the mill or pan processes, make it necessary to concentrate and settle them from the less valuable portions of the pulp. This arrangement consists of a pan having a central hub through which an upright shaft passes, and is turned by gearing beneath. A sort of yoke is fastened to the top of this shaft, and extends to near the bottom of the pan, carrying a series of arms or stirrers which separate and agitate the pulp. The process of settling is facilitated by hammers which are operated by levers, and pins on the back of the gears, so as to strike the sides of the pan, and by the percussion cause the heavy and valuable portions to settle rapidly. This device is already in successful operation.

83,260.—IMPROVED WASHING MACHINE.—G. A. Dabney, San José, Cal.:

I claim the reversible rubber G, constructed as described in combination with the side bars F, swinging bars D, and removable rubbing platform K, L, substantially as herein shown and described, and for the purpose set forth.

83,275.—IMPROVEMENT IN LUBRICATORS FOR STEAM ENGINES.—George Girty, Rainier, Oregon:

I claim the two valves L, I, pipes B, E, oil chamber D, and lever F, all constructed and arranged to operate in the manner substantially as and for the purpose set forth.

83,283.—IMPROVEMENT IN GANG PLOWS.—H. R. Huie, Haywards, Cal.:

1. I claim securing the arm *e*, of the axle *f*, to the axle-tree *a*, by means of the eye-bolt *i*, as shown in and described.

2. The crank bolt q, in combination with the eye-holt *r*, for adjusting the tongue as herein set forth.

3. The arrangement and construction of the plate *l*, ears m, and boxes *n*, which allow of their being cast as one piece as herein described.

83,306.—IMPROVEMENT IN MORTISING MACHINES.—Francis Parker, Petaluma, Cal., assignor to self and C. W. Ormsby, of same place:

I claim the gauge-rod B, with the slides D, E, F, G, or their equivalents, together with the stops R, S, T, U, V, W, when constructed substantially in the manner and used for the purpose above described.

The "Dead Rivers of California," is the title of an article in the November *Overland Monthly*, written by a person who has undoubtedly had something to do with gravel mining, as his facts are original, interesting and pertinent. He is much more positive, however, that the "Big Blue,"—the supposed Mississippi of the Sierra Nevada,—is not a myth, than we are. This is the ancient channel which some will have was the ancient Colorado. The present writer gives his weight cautiously in favor of the hypothesis that it must have been the ancient Columbia. The slight difficulty of granite mountains being in the way which are certainly older than the tertiary river channels, has not suggested itself, no more than the fact of unaltered sandstones of older Tertiary and Cretaceous age lying all along foot-hills of the Sierra Nevada, and testifying as plainly as need be that the mountains could not have been raised any since these were deposited;—taking Prof. Whitney as authority, that they are still lying as originally deposited.

CLIMATIC CAUSES.—We are told that the climate of Japan has been cool like our own. As it is known that the earthquakes of last year in the West India seas were followed by a change in the Gulf Streams of the Atlantic, which regulate the distribution of heat. We cannot be sure but that even temperature and the earthquakes may have had something to do with each other on our coast; though theorics come with the best grace always when accompanied by the directly governing facts. Seamen found the warm current from the Gulf of Mexico 100 miles farther east than formerly, and a corresponding change must have occurred in the course of the cold streams returning from the Polar Seas.

The currents of the air and of the ocean, when once sufficiently observed and mapped on our shores, will doubtless furnish us with amply satisfactory data concerning the peculiarities of our climate, and the modifications of the same.

The article in the second number of the *Overland Monthly*, entitled "Meteorology from Tamelpais" was an able and valuable contribution to local meteorology, which will be worth specially sending for by those who love to study the *rationale* of the weather. It was written by Dr. Stillman.

THERE is no mistake about it, Plantation Bitters will ward off Fever and Ague and all kindred diseases, if used in time. No family need suffer from this distressing complaint if they will keep Plantation Bitters in the house, and use it according to directions. The most important ingredient of this medicine is Calisaya Bark, which is known to be the finest and purest tonic in the vegetable kingdom. The extract of this bark is the active principle of all the good fever and ague medicines prescribed by intelligent doctors. Calisaya Bark is used extensively in the manufacture of Plantation Bitters, and we dare say, owe their popularity mostly to that fact. We can recommend them. *

HYDRAULIC ENGINE.—H. B. Martin & Co. are constructing a little hydraulic engine to be run by a stream of water from the street main, for the purpose of blowing the organ of the new Calvary church. By turning a stop-cock the organist perfectly controls the machine.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Weekly Stock Circular.

By Associated Srokers of the S. F. Stock and Exchange Board.

San Francisco, November 7, 1868.

Financial.

We are are indebted to the *Commercial Herald* for the following:

Although deposits in our Savings and Loan institutions have been quite heavy during the past week, there is so active a demand for money that a slight stringency is observable in the market. This does not, however, affect rates of interest in bank, which have undergona no change, being 1@1¼ per cent. per month on call loans, and twelve per cent. per annum for long periods. In this respect our market evinces a material difference from that of the Eastern cities, especially New York, where rates vibrale with remarkable sensitiveness, rising with the slightest stringency and falling as rapidly with an easy market. Not being of the "greenback" persuasion, our financial operations are altogether more substantial and satisfactory. Gold bars are not in great demand for shipment, the greater number going to tha Mint for coinaga. We quote them at 840.

Our City Treasury contained $1,411,650 on the 31st of October, all of which was gold coin, with the exception of $61,650. It would be a most desirable piece of financiering if this money, and that locked up in tha State Treasury, could be utilized without bringing it into competition with private funds.

Mint statistics demonstrate tho following facts: Gold deposits for October amounted to 127,716 ounces; silver deposits for the sama month, 37,358 ounces. Tha gold coinage was $2,390,000, and tha silver coinage, $25,000. The gold deposits since January have amounted to 660,657 ounces, and the gold coinage, for the sama period, was $11,870,000; the silver coinaga being $478,000. Tha total coinage at tha Parent Mint, Philadelphia, from January to October, inclusive—ten months—will not exceed $1,700,000, or $715,000 less than was coined in tha San Francisco Branch in the single month of October. In tha "Parent" coucern every aid that ingenuity and skill have inveuted ara brought into use. Tha building is large, roomy, well ventilated, and constructed with a special view to tho melting, refining and coining processes. Hero thesa operations are carried on iu a wretched den—dark, without ventilation, cramped and altogether unfit for the purpose. Government has sbown a most niggardly spirit toward this coast, and treats it as Spain does tha "ever faithful isla" of Cuba.

Real estate transactions for October amounted to $2,511,702 on 616 sales, being 16 sales less in number and $293,693 less in amount than for tha month preceding. Since the memorable occurrence on tha 21st of October to tho 31st of tha samo month—ten days—213 deeds were recorded, showing an aggregate valus of $913,108, which is sufficiently conclusive that our peoplo bavs not lost tbeir confidence in tha valna of this kind of property. Tha number of mortgages effected in October was 263, with an aggregate value of $1,009,754; tho number of releases for the sams period was 123, representing $339,359.

City Stocks.

During the period under review transactions in miscellaueous secnrities were small. We note sales of North Beach and Mission Railroad stock at $70 per share. We nnderstand that books bave been opened for subscriptions to tbc new street railroad which is to have its starting point at the corner of Jackson and Montgomery streets. From there the track is to be laid along Jackson to Powell; along Powell to California; along California to Taylor; along Taylor to Pacific; along Pacific to Leavenworth; along Leavenworth to Vallejo; along Vallejo to Hyde; along Hyde to Union; along Union to Larkin, in the direction of the Pioneer Woolen Mills.

Tbe Spring Valley Water Co. will disburse its nsual monthly dividend on the 10th inst. San Francisco Gas Co. paid its nsnal dividend on the 2d. At tbe close a few shares of Spring Valley sold at $65 50.

Mining Share Market.

The markct for mining shares has been rather dull since our last similar reference, the sales, in the aggregate, amonnting to a great deal less than for some time past; and for the most part N. Mackay; President, J. D. Fry; Vice-President, Louis Gerstle; Secretary, H. C. Kibbe; Superintendent, P. N. Mackay; Treasurer, W. C. Ralston

The aggregate sales for the week amounted to $1,259,530.

Savage—declined from $72 to $66 50, and closed at $68 60. No dividend has yet been declared for the present month. If any will be paid it will not exceed $2 50 per share.

Imperial—sold within a range of $95@104, then at $92, closing yesterday at $97. The machinery bad been temporarily stopped, but is again in good working order, having commenced to hoist ore on the evening of the 4th inst. The Imperial-Empire shaft is going down at the rate of a foot and a half per day. No favorable developments as yet in the drifts on tbe 900 level. The October receipts of bullion foot np $58,229 17, against $64,532 in September.

Gold Hill Quartz—shows a bullion yield of $9,103 63 from 429 tons of ore, equal to $21 22 per ton, for the month of October. In September the receipts amonnted to $10,318..... Confidence turned out $22,831 63 in bullion from 1,046 tons of ore during the month of October. The September yield was $21,280.

Crown Point—receded from $43 to $41 50, and closed at $42 50. The stopes between the 700 and 800 levels are about exhausted. The sill floor of the 850 level is opened about 50 feet nortb of the sonth winze, and is said to show an improvement in the face of the drift, the pay body being about three feet wide—ore that will mill about $30 to the ton. On the 900 level the raise from north winze is np 46 feet, but does not show much improvement, the "pay" being a little more than three feet wide, and reported to be good ore. Tbe shaft is thirty-one feet in deptb below the 900 level.

Kentuck—dropped from $250@205, and closed at $218. Tbe receipts, as far as reported for October, foot np $69,145. A dividend of $20 per share is payable on and after the 10th. ....Alpha sold at $40 50@35, and closed at $36 50. The drift on the 940 level is in hard ground. The 840 level does not look as well as formerly.

Chollar-Potosi—advanced from $134 to $140, and closed at $139. During the week ending October 30th they extracted 1,746 tons of ore. It is reported that the ore obtained from each face in tbe Blue Wing stope will pay a profit over expenses, and from present appearances this portion of the mine can be depended on for a large amount of low grade ore. The receipts of bullion in October amounted to $112,898, against $78,013 in September.

Empire—sold duriug the week at $100, seller 3. During the month of Octobcr, $16,804 in bullion came to band, against $18,837 in Septembcr.... Sierra Nevada sold at $25@28. In October $5,191 in bullion was received, against $4,542 in the previous montb....Eureka (Cal.) shows a bullion yield of $33,826 from two shipments during the month of October.

Gould & Curry—sold at $81@85. The porphyry whicb made its appearance at tbe soutbwest corner of tbe shaft, mentioned in our last issue, did not last over two days, and since which time work has continued in "clay"..... Overman was quite active during the past week, selling at $60 50@70, and closing at $64. So far for October the bullion receipts foot up $35,000.

Amador—sold to a considerable extent within a rauge of $230@205. During the month of October, 2,633 tons of ore were sent to tbe mill, On the 4tb instant 700 tons were on haud at the Rose mill. Tbe receipts of bullion for October amounted to $46,600, against $42,300 in September. Tbe Superintendent reports that the Badger shaft is 72 feet in depth below the lowest level, and that tbe vein is improving on the south side of the shaft. The vein in the drift of the Sacramento level shows considerable improvement. They are preparing to sink the north shaft in order to connect with the Badger, which it is thought can be done in about three months. For the twelve months ending September 31st, 1868, the average yield of bullion to the ton has been $22 02.

Yellow Jacket—rose from $1380 to $1460, declined again to $1380, and closed at $1410. This company has declared a dividend of $300 per share for the past quarter, payable on the 10th instant.

Belcher—ruled at $110@140. This company is now incorporated under the laws of California, with a capital of $1,040,000, divided into 10,400 shares, giving ten shares for one of the old stock. The following are the officers just elected: Trustees, J. D. Fry, B. F. Sherwood, Louis Gerstle, E. B. Mott and Patrick

Ores.—Fine specimens of chloride and sulphide of silver from White Piue, Nevada, have been shown to us by Messrs. T. L. Burton and J. W. Kimball, who are just returned from Battle Mountain, at the mouth of Reese river. The sulphide of silver being pure, contains 87 per cent. of metallic silver, and the chloride or horn silver 75 per cent. Stacks and pillars of this ore bave been surrounded and are now being worked out.

At Battle Mountain ores of a similar character have been found, in a slate and limestone country, with intervening veins containing copper which assays $50 to $65 in silver, $5 in gold and 22 per cent. in copper. The veins are well defined, and very flat, cutting across a mountainous point between Humboldt and Reese rivers.

San Francisco Prices of Copper Ores.

San Francisco, Nov. 6, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

		Per ton.				Per ton.
12	per cent. ore	$16 00	22	per cent. ore		$43 56
13	" "	18 62	23	" "		46 45
14	" "	23 20	24	" "		49 33
15	" "	23 35	25	" "		52 22
16	" "	26 23	26	" "		55 11
17	" "	29 12	27	" "		58 00
18	" "	29 91	28	" "		60 80
19	" "	34 90	29	" "		63 77
20	" "	37 78	30	" "		66 66
21	" "	40 67	31	" "		69 55

These prices, we believe, will be found substantially correct, and can be realized at this date.

The Brazilian Pebble Spectacles are believed to be the best for the eyes. They can be had at Muller's emporium, 205 Russ Block. *

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleville *Miner*, Oct. 24th: The Globe Tunnel is now in 70 ft., and having struck much easier working rock about 10 days since, good headway is now being made. The rock is filled with sulphurets and considerable water is encountered, showing the near proximity to the ore deposit for which the tunnel is running.

The stoppage of work on the IXL mine has caused a fluttering among those who pinned their faith on that for bullion results to keep our snow-bound town alive this winter.

Director Culver is busily engaged in putting his mill in readiness for turning Star ore to bullion.

Chronicle, Oct. 24th: The Pittsburg mill on Thursday last commenced running on IXL ore.

The late strike in the Rippon has created a demand for stock in the Mountain. The rock is more easily worked now, and the tunnel is being pushed ahead with energy.

The Pioneer Quartz Mill, at Markleeville, has been purchased by the Morning Star Co., and a large number of workmen are now engaged in putting it in order for running.

Calaveras County.

Mokelumne Hill *Chronicle*, Oct. 12th: A quartz vein, which for richness bids fair to eclipse any lead yet prospected in this county, was discovered recently near Railroad Flat, in a very singular manner. A man was engaged in hauling saw logs, using a truck for that purpose. He used a rock to "chock" the wheel, which broke under the pressure, and the teamster happening casually to examine it, discovered that it was literally covered with gold. A claim was immediately located and work commenced. A shaft has been sunk to the depth of 30 ft., developing a ledge from 12 to 15 inches in width, of most unexampled richness. We understand that the proprietors offer to bet that they have got a ton of ore that will pay $1,000 for crushing.

Kern County.

The Havilah correspondent of the Visalia *Delta* of Oct. 28th, says: The prosperity of the mines in this district has been retarded this season by the superabundance of water, and the time and expense attendant on procuring proper machinery, and in sinking shafts in view of a vigorous working of the mines in future. Next season will show the richness of our mines to be equal to any in the state. Last spring the Joe Walker Co. had sunk their shaft for a new level, and were nearly ready to begin stoping, with fine rock enough in sight to last them the season, when they were drowned out by the water, which before had not impeded their work. They purchased a new Cornish pump capable of hoisting 2,000 gallons an hour, and will be at work raising quartz this week. H. McKeadney has just returned from San Francisco, where he has made arrangements to vigorously prosecute work on the Delphi and Countess lodes; they are the richest in the district, but are not large. By spring he will be in full and successful operation. Col. Rand has the shaft down on his mine, and has a splendid lode, after sinking through a "horse" for a long distance. The lode is about three feet wide, and exceedingly rich—will not crush rock till spring. The N. Y. & Clear Creek Gold Mining Co. will not be ready to crush rock till spring. A tunnel is being run to tap one of their lodes deeper, which will probably take till spring to complete. There are several other good ledges partially developed that will not be idle long.

Los Angeles County.

The Los Angeles paper says: In the Soledad mine the ten-stamp mill of Polk & Kabler is running, with plenty of rich ore. Several arastras are also in operation, and about 100 men at work.

Mariposa County.

Mail, Oct. 30th: Wm. Sims, a well-known miner of this county, struck a vein of quartz near the Ferguson mine, on the main fork of the Merced river, exceeding in richness anything that has lately been discovered.

Hite & Co., at Hite's Cove, after a run of three weeks, cleaned up the sum of $20,000.

Robert and James Nelson have struck a pocket in a quartz vein near Hornitos, from which they have already bagged $25,000 to $40,000.

Gazette, Oct. 30th: The mill on Buckingham mountain, now being constructed at Harbour & Co's vein, is rapidly approaching completion, and in a few weeks will be sending forth a stream of its golden treasure. Judging from present indications, the rock will speedily pay for all outlay in improvements.

The dam of the Mariposa Co., at Benton Mills, was finished on Thursday last, Oct. 29th. We had an opportunity to examine the work a few days before while the planking was so far incomplete that the internal as well as the external structure could be fully inspected. We should not know where to send a person to see another so strong and massive a combination of wood and iron, for any purposes, as that which, within the last six weeks, has been built into the Benton dam.

Nevada County.

Transcript, Oct. 28th: For some time past workmen have been engaged in running a tunnel in the Jim mine near Eureka, and a short time since they struck a splendid five foot ledge. The quartz is said to be the best ever seen in the district.

Gazette, Oct. 27th: We learn that the contractor has already completed 17 miles of the ditch of the North Bloomfield Gravel Co., leaving only six miles more to be dug to complete the contract. It is the intention of the company, however, to continue the work, and carry it six miles further this fall, by which they will have an additional supply of water. Next season the work will be continued and carried to the South Fork of the Middle Yuba.

Grass Valley *National*, Oct. 29th: This mill has been idle for some time past, owing to the old water wheel having been in a dilapidated condition. Workmen are now engaged in making a new wheel, and it is in contemplation to build a new dam, as the old one was nearly destroyed by the floods of last winter.

The Seven-Thirty mine, from 33 tons of rock, recently cleaned up the sum of $6,097.42, being an average of $184.77 to the ton. The gold is remarkably pure and was bought yesterday by Thos. Findley & Co. for $17.96 per oz.

Grass Valley *Union*, Oct. 29th: The Mutual Mining Co., which works the Jim ledge at Graniteville, a few days since struck in their tunnel a five foot ledge, which looks rich.

EXCELSIOR.—Virginia *Enterprise*, Oct. 30th: We understand that the Emigrant Co., Meadow Lake, recently cleaned up $2,000 from a crushing of 100 tons of their ore.

Plumas County.

Quincy *National*, Oct. 29th: A nice little nugget, perfectly pure and weighing something over 17 ozs., was picked up in the claims of Stevens & Fowler, on Willow Creek, one day last week. This company are averaging about $5 per day to the hand.

New diggings have been struck in the Wild Cat Channel, upon the North Fork in Plumas County. The diggings, it is thought, will prove rich and extensive.

A correspondent writing from Soda Bar, says: This mining camp is looking up, and all the bars from this to Rich Bar are being located by miners, who say that the worked-out East Branch is not half worked out yet. Twelve-Mile Bar is all afloat with miners, who are paying big sums for "played out" diggings.

San Diego County.

San Diego *Union*, Oct. 24th: The Jacum Valley correspondent writes: There has been a party of prospectors here for the last five days, prospecting the mountains for the "root of all evil." Two of them are from San Diego. They have had good success, having discovered three or four rich leads of Silver, only a few miles from this place. Some of the specimens are exceedingly rich. They left this morning, all highly pleased with the result of their labors. It is, and has been the opinion of the settlers, that good gold and silver mines abound in the mountains in this vicinity. Still, strange to say, they have never been prospected for before. If some good miners were to come in here, who were familiar with the nature of both gold and silver, the probability is that they would secure their everlasting fortunes.

ARIZONA.

Prescott *Miner*, Oct. 17th: A recent letter from Hardyville informs us that a large body of rich ore has been struck in Mr. Hardy's mine.

Sol. Jackson and John Roberts, on Thursday last, took a pick, pan and shovel, started up Granite creek, and found prospects of 4½ cents to the pan.

Brooks and Lynn, of Upper Lynx creek, came down from the old camp this week and inform us that but few men are now on the creek and but little doing, the water having almost dried up. Nevertheless, we look for lively times in the old camp as soon as Graves gets his desulphurizer going.

A party of Mexican miners arrived here yesterday from Weaver Diggings, in this county. They inform us that some 30 men are now working in the diggings, and doing very well. Water was scarce when they left.

COLORADO.

Central City *Register*, Oct. 15th: From the gold mines around Empire they are taking $10 per week for every man, woman and child in that vicinity....Gentlemen interested in the Baker mine are out from Philadelphia, and have made arrangements to continue work....Mr. Cash has his mill in Black Hawk nearly ready to work. It is put up in a very superior manner, and is expected to do good work.

Ores of the Terrible lode smelted at Newark, New Jersey, yielded between $700 and $800 per ton....About two miles below Black Hawk, on Clear Creek, Alex. Cameron has a creek claim on which are working 10 men, taking out about $8 per day to the man, Saturday they took out a nugget weighing 51 pwts. 6 grs.....Robt. Frasier of Cañon City, laid on our table yesterday samples of silver ore from mines newly discovered, located on the Platte five miles down the river from the forks, on the South Park road. The ore before us is argentiferous galena apparently containing some brittle silver. It looks extremely well, and if it does not assay well its looks deceive. Another lode located there produces quite a different ore which we have not seen, but from description probably contains considerable decomposed zinc, and is reported rich in silver. The crevices are reported wide and the body of ore strong. The ore shows the presence of country rock different from that of Argentine or Snake River.

Denver *News*, Oct. 14th: Mr. Fleming, one of the company which has been working McNulty Gulch, Summit County, was in town to-day, disposing of some gold dust. He had some beautiful specimens with him. The gulch has paid uniformly $10 per day to the man, during the season. Work has now ceased.

Since the first of the month Cyrus Hurd started 20 new stamps in Black Hawk, and Mr. Brastow about the same number in Lake Gulch.

The following is a summary of some of the runs made at the reduction works of Huependen, Wolters & Co. since last May: 31 tons Equator ore, average assay, 118 6-10 ozs. per ton, total yield $3,823.66 in coin, average per ton, $123.34 in coin; 10 tons Equator ore, average assay, $158 4-10 ozs. per ton, total yield $1,648.40 in coin, average per ton, $164.84 in coin; 10 tons Equator ore, average assay, 124 7-10 ozs. per ton, total yield, $1,300 in coin, average per ton, $130 in coin; 24 tons 700 lbs. Baker ore, average assay, $57.29 per ton; total yield $1,120.40 in coin; 12 1-10 tons Astor ore, average assay, 121¾ ozs. per ton; total yield, $1,569.19 coin; 8 tons Buckeye ore, average assay 77¼ ozs. per ton; total yield, $618.58 coin. 20 tons Clift ore, assay, 72 ozs. per ton; total yield, $1,497.60 coin; 2 35-100 tons Clift ore, average assay, 90 ozs. per ton: total yield, $223.02 coin; 9 1-10 tons Lillie ore, average assay, 150 ozs.; total yield, $1,406.28 coin; 8 tons Sonora ore, average assay, $80.03 per ton; total yield, $512.24 coin.

These ores are all second class. The amount saved is from 80 to 85 per cent. of the assay.

Mr. Gould, of the Sterling Co., informs me that during 30 days he mined 40 cords of ore, selling first-class at $221 currency per ton; second class at $78.85 currency per ton; and the third class yielding $150 per cord in the stamp mill. The proportion, Mr. Gould says, was 1-10 first and second class, and 9-10 third class.

A 100-stamp mill is being erected by the Consolidated Gregory Co. Fifty stamps will be ready to run by Nov. 1st, and the balance next season. The mine is being developed in the meantime, and put in a condition to work 100 men, if necessary.

The Smith & Parmelee Co. are putting up a new 25-stamp mill, and have a new 75-horse power engine. The work will be completed and the mill running by November 20th.

Georgetown *Miner*, Oct. 8th: Huependen, Wolters & Co. have shipped, since our last issue, 1,307.25 ozs. of silver bullion, coin value $1,430.83. They are now engaged in excavating for the foundation of another chloridizing cylinder, which will make their works double their present capacity.

At the Brown Co's works they commenced smelting ore from the Brown lode on Monday last, and have out a large quantity of lead riches.

The shaft on the Munsell lode, situated on Leavenworth Mountain, is just coming into mineral again. The last 15 ft. passed through has been barren.

Bruckner & Schirmer commenced desulphurizing on Tuesday evening last, and in a few days they will be turning out lead riches.

DACOTAH.

Virginia *Enterprise* Nov. 1st: A letter written from South Pass City, dated Oct. 4th, says: "I am in the Sweetwater mines, working like a tiger. I am taking out some of the richest rock that the earth ever produced. This country is going to make another California. We have the mines and the finest rock I have ever seen. There is but one mill here as yet; it is owned by Col. Tozier & Co., of Nevada. But this is not capable of crushing a twentieth part of the custom rock that is every day brought to the mill. There are two other mills on the way here from Chicago, Ill., which will arrive in the course of 20 days, when we hope to have lively times. One of the mills is owned by Mr. Mills, of Virginia City, Nev. It is a 20-stamp mill.

IDAHO.

Boise *World*, Oct. 21st: Two miners near Centerville, who had come from Deadwood nearly broke, and who hired out to work on one of the claims in Baboon Gulch, while prospecting near there struck good diggings, from which they have steadily taken good pay.

The quartz mining about Warren's is steadily progressing in importance. Several arastras are paying well, and the new 10-stamp quartz mill of Capt. Williams will be ready to work next season.

From Channel & Thatcher and Mr. Goldtrap, the owners of the two principal mining ditches at Centerville, we learn that never in any previous season has the water been at so low a stage as at present. In both ditches not over between 400 and 500 inches of water now course; but the volume in each ditch will not further diminish this season, and will last until the winter stops the mining for the year. There are over 200 white men steadily at work in and about Centerville district, within a circuit of three miles, and more than this number of Chinamen. And the larger portion of these miners will be able to continue profitably at work until hard freezing weather compels them to suspend operations for this season. From very good to fair wages are usually earned, while some are reaping rich pay. The prospects for the ensuing season, provided the winter shall be favorable to mining, are very gratifying.

Owyhee *Avalanche*, Oct. 18th: Information reaches us of a rich gold discovery recently made on Lightning Creek. It was found in the hill behind the old Butcher claim. Another gold discovery is reported on Hard Scrabble Creek.

MONTANA.

Helena *Post*, Oct. 23d: Wm. Nowlan, Con. Weary and Capt. Fleeson, arrived in Helena last evening from Cable, bringing with them 367½ ounces of retort, the product of a 7 days' run in the Wm. Nowlan mill, on ore from the Cable mine. This retort is of a good quality,—averaging .900 fine, and loses less in smelting than that from any other mine in the Territory. That brought in last evening was worth nearly $7,000 in coin.

F. Bohn & Co. yesterday manufactured $15,000 worth of bricks.

Great excitement has been occasioned at Diamond City recently by the discovery of rich deposits of gold in the lower portion of Confederate gulch. During the latter portion of last week, parties at work in the lower drain ditch, near the Cañon House, found prospects of $2 to the pan, and similar pay has been found in the drain ditch next above. This becoming known, the whole gulch was immediately in a fever of excitement, each individual organizing a stampede on his own hook, and planting himself on the first unclaimed ground that he could find. The consequence is, that the whole gulch has been taken up by claimholders as far as the stage station, at the mouth of the cañon, and it is even thought by some that the ground will pay from that point the entire distance to the Missouri river. Confederate gulch is now staked its entire length, or over 8 miles, and is rightly considered one of the best and most prosperous camps in the country. It now has 14 drain ditches and bed-rock flumes, either in operation or in process of construction, in all of which satisfactory results are being obtained.

The Nelson Gulch correspondent writes: On Discovery, Ricker, Gow & Co. are sinking a shaft and expect to strike it rich. On claims Nos. 5, 6 and 7. S. Arthur & Co. are making wages, and John Gow & Co. are doing the same on Nos. 8, 9, 10, 11 and 12. Above this, Nelson Gulch is not worked at present. Harlan's Bar, situated in the vicinity, is very rich. On Discovery and Nos. 1 and 2 above, Harlan & Co. are making $9 per day to the hand. Nos. 3 and 4 are owned by John Gow & Co., and all the claims from 5 to 12 inclusive by McDannal & Co. These claims are very rich and would

pay from $5 to $6 per man to the hour if water could be had for working them. White & Co. own a sag running from the Park and forming a junction with Nelson just below the Gorruley mill. The ground is rich and would pay at least $18 per day to the man if water could be had for working it. For the purpose of providing water, this company has constructed a ditch two and a half miles in length at an expense of $2,500, but it is found to be not of sufficient capacity.

NEVADA.

Humboldt.

Unionville *Register*, Oct. 24th: The contractors are progressing finely in the erection of the new mill for Stewart & Co. The owners of the '56 mine, near the Humboldt river, have made arrangements to ship by the Central Pacific Railroad 10 tons of ore to San Francisco.

The last lot of 10 tons of Monroe rock worked $75 per ton. This clean up is quite satisfactory, but the next he thinks will go higher. The mine continues to improve every day.

Gov. Fall's mine looks better now than it ever did before.

Holt's mill, at Gold Run, will be in running order in a few days, when he will commence work on ore from the Golconda mine. He has a contract for crushing 400 tons of ore.

Fall & Co. shipped this week, per Wells, Fargo & Co's express, 2,800 ounces of fine bullion.

The Battle Mountain mill, owned by McBeth, Atchison & Co., is a perfect success, and by its first run has demonstrated the fact that their mine is a big thing. Ten tons of very inferior ore were first run through the mill in order to get the batteries, pans and machinery in good condition for work, which, when cleaned up gave $500, or at the rate of $50 to the ton. The company is now working 50 tons, which will yield at the rate of $200 to the ton, or $10,000 for the whole.

The Austin *Reveille* of Oct. 26th, speaking of the Little Giant ledge on Battle Mountain, says: The value of this ledge is undisputed. Shortly after its discovery a mill owner named Atchison erected a mill on Long Creek, in the vicinity of the mine, and worked the ore to advantage. Of a large number of tons worked, the average yield exceeded $200 per ton. The ore is worked without roasting, and probably not over 60 to 70 per cent. of the silver is reclaimed. The mine is pretty thoroughly developed by tunnels and shafts, in which which the small vein of highly concentrated ore is regular and undisturbed from the surface downward.

Winnemucca *Argent*, Oct. 29th: There was shipped from the Golconda mill bullion weighing 90½ lbs. last week. It was worth $1,100.

Ten tons of ore from the Monroe mine at Dun Glen, recently worked, gave an average yield of $73 per ton.

Alex. Middleton, of Paradise, informs us that gold has been discovered in Woodman's Cañon, on the west side of Paradise Valley.

The Unionville correspondent writes: Mining matters are favorable. Both mills are running and the mines turning out splendidly. The boys in the Arizona Consolidated have struck a fine ledge in their shaft at a depth of 90 ft., and the ore is alive with silver. Specimens brought down yesterday show native silver in large quantities. A track has just been put in the incline, and four or five tons of this kind of ore will be taken out daily while the shaft is progressing downward. A contract has been let to run a tunnel to the Halleck, Golden Eagle, and other ledges comprising the property of the Seminole Co. Work on the Agamemnon will be resumed as soon as an air pipe is put into the tunnel.

Austin *Reveille*, Oct. 26th: The Atchison quartz mill in Battle Mountain district, is run altogether and successfully with no other fuel than sage brush. And we learn that the proprietor of the mill says it is more economical fuel than wood at $10 a cord. Indians gather the brush for $1 a day, and one man and a four-mule team keep the mill supplied. The nearest timber is some 15 miles from the mill.

Reese River.

Austin *Reveille*, Oct. 23d: We saw this afternoon at the assay office of David Lundbom 5 bars of bullion, of the average fineness of .965, and valued at $6,664.97, which were brought into this city yesterday afternoon from the mill of the Monte Cristo Co., at White Pine. The bullion is the product of ore obtained from the Eberhardt South.

Several parties left the city yesterday for the scene of the reported discoveries of rich ore at the point called Duckwater, 30 miles south of White Pine. Others talk of following to-day or to-morrow on the same business. The new discoveries are reported by rumor to be equal to the best mines in White Pine.

Oct. 24th: We saw to-day at the assay office of Boult & Stetefeldt a small bar of gold valued at $350, which was produced by the mill in the district of New Pass.

A couple of wagons arrived in this city yesterday with hoisting apparatus from Yankee Blade, which we were informed was to be taken to White Pine.

We were informed yesterday that the Twin River Co., which owns a superb mill of 20 stamps capacity and the famous Murphy mine at Opair Cañon, in Nye County, about 55 miles south of Austin, has declared itself bankrupt.

W. S. Gage & Co. received to-day 16 bars of bullion, averaging .967 fine, and valued at $22,532.14, from the Centenary mill in the district of Newark. The bullion was produced partly from ore from the Eberhardt South in the district of White Pine, and the remainder from the mines of the Centenary Co. The mill of that company has been very productive lately.

This morning, 22 bars of fine bullion, valued at $32,000, were brought to the National Bank in this city from the district of White Pine. They were produced at Page's mill, at Silver Springs, and were obtained from ore of the Eberhardt South.

Oct. 26th: On Saturday evening, eight bars of bullion, averaging .978 fine, and valued at $11,062.56, were brought into the National Bank of this city from the Monte Cristo mill at White Pine.

Yesterday some 3,000 ounces of crude bullion arrived in this city from Rigby's mill in the district of San Antonio.

Oct. 29th: Five bars of bullion, of the average fineness of .984, and valued at $6,732.23, were brought into the city yesterday from the mill of the Monte Cristo Co., at White Pine.

Oct. 30th: A wagon arrived in this city yesterday afternoon from the mill of the Centenary Co., in the district of Newark, with 23 bars of bullion. The bullion averaged .965 fine, and is of the value of $32,836.35.

Virginia *Enterprise*, Oct. 28th: Parties from White Pine tell it as a fact that in the towns in that region lumps of silver ore are used as a circulating medium, and is found to answer very well in the absence of a sufficiency of coin. Even at the gaming tables, ore goes. The kind of ore used is the pure chloride, which is so rich as to be quite malleable. A miner with a sack of this kind of currency under his arm marches up to a faro table, takes out a chunk, and plants it upon a card, calling its value as he puts it down. For instance, the chunk is supposed to be worth $5, the miner as he puts down says, "Five dollars." The faro man picks up the lump, looks at it, and if satisfied, says, "Five dollars goes," then wins the lump, and throws it into a gunny sack standing behind him.

The Grass Valley *Union* says: Billy Hale, an employé in the office of Wells, Fargo & Co., in this city, yesterday took a piece of White Pine ore to the assay office of Bousfield & Co., for assay, and was somewhat surprised to obtain from the lump—which was hardly as large as a man's fist—a bar of silver weighing six ounces.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.

Virginia *Enterprise*, Oct. 28th: The shaft in the Imperial Empire is now down 1,025 feet. At the depth of 1,100 feet, a new level will be opened. The rock is at present very hard, and Giant powder is used in blasting it.

Oct. 30th: Mr. James Maloue, of this city, yesterday showed us a silver brick worth $7, which was extracted for him by Wiegaud & Co. from a lump of White Pine ore weighing 2¼ pounds.

Oct. 31st: There was shipped from the express offices in this city and Gold Hill during the past week 6,754 pounds of assayed bullion, valued at $180,626.73.

Gold Hill *News*, Oct. 28th: The west drift at the 900-foot level in the Imperial mine has penetrated nearly 450 feet from the new shaft. The face is in quartz and porphyry, with no very good indications of ore. Having so nearly reached the west wall, the chances for cutting a rich streak are rather slim. The drift from the winze, 50 feet below the 700-foot level, is in 60 feet, and shows no indications that the body of ore found in the level above extends down that far. Good quantities of excellent pay ore continue to come from above the 400-foot level. The new shaft is expected to develop good ore at the 1,100-foot level when it shall be opened.

The Chinese gold mining excitement is subsiding.

Engineering.

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

The Association met on Tuesday evening, October 13th, President James A. Whitney in the chair.

The regular subject for discussion was "Air Motors and Atmospheric Propulsion."

A paper on this topic having been prepared by Mr. Perry Dickson, M. E., was read by Mr. Wm. B. Harrison, the Recording Secretary.

In opening, the writer of the paper briefly reviewed the early systems of air propulsion which in England some twenty years ago excited much attention and involved the loss of much money in the attempts to carry them into practice. One of the first and most noted of these was one in which a suction tube was laid the entire length of the line and formed with a longitudinal slot in its upper side throughout its whole extent. This slot was covered by a flap or valve attached at one edge of the slot and opening to permit the passage of the rod or shank which connected the piston within the tube, with the car running above it. The air being exhausted from the tube in front of the piston, the pressure of the atmosphere behind the latter of course moved the same with the car attached thereto. This plan failed after a trial of eighteen months, from the difficulty of keeping the longitudinal valve intact, although when the whole was in good order a pressure upon the piston of ten pounds per square inch was readily obtained. A similar result followed the adoption of a plan in which the shank connecting the piston with the car was made flat, like a knife-blade, and passed through the slot in the tube between the two elastic air-pipes, which closed the slot by their contact in front of and behind the shank as the piston moved along.

With regard to the well-known plan of providing the cars with tanks to contain compressed air to feed the driving engines, the writer urged the objection of the great weight of the tank required to carry air at any moderate pressure sufficient to propel the car for any considerable distance. Thus an ordinary car would require a tank holding sixteen hundred feet of air, at a pressure of one hundred pounds per square inch to run a mile, while by increasing the pressure and diminishing the size of the tank, the liability of loss by leakage would be materially increased. The system of interchangeable tanks, charged with the air compressed, would occupy too much time in substituting the charged tanks for the empty ones, and coupling them to the engine. Calorie engines were declared unsuited to the purpose, the writer claiming that their power is over-stated, and besides, they do not get rid of smoke and gases, which is essential in any improved means of propulsion. With regard to the "pneumatic tube" system, in which the carriage constitutes the piston and is forced through the tube by atmospheric agencies, the author expressed the oft-repeated and common opinion that although fitted for the transportation of parcels, its use for passenger travel is inadmissible. The use of carbonic acid gas engines, which has sometimes been suggested in this connection, was briefly reviewed, the writer showing that in order to save the comparatively costly gas, to be used over and over again, would require the employment of a receiver of preposterous size. He concluded by explaining an invention of his own, which he believed would be found to constitute a most efficient means of propelling cars by compressed air. In this the air is compressed by stationary engines into a tube laid the whole length of the track and furnished at intervals with apparatus by which the air may be automatically supplied to small receiving tanks, placed on the car, without stopping the latter.

In the debate succeeding the reading of Mr. Dickson's paper, much curious and interesting information was elicited concerning the early history of this department of engineering, and the causes that have caused or promoted the failure of the different plans. Mr. J. K. Fisher stated that one great obstacle in the way of successfully employing atmospheric propulsion for cars, will be found in the difficulty of running the cars in quick succession; but no difficulty will be found in keeping the air compressed to the requisite degree in the reservoirs or tanks. In some of the early English trials the air was compressed on Saturday and left over until Monday, before using. Mr. Creuzbauer said that the greater the degree of compression the greater the heat evolved and dissipated, and of course the greater the proportion of power lost. Mr. Dickson's method, just explained, possessed the merit of working with air at low pressure, by which waste from this cause was greatly lessened. Mr. Samuel Carson explained a method projected by him some years since, in which the cars were provided with receiving tanks to be filled with compressed air from stationary reservoirs along the line, the valves of the tanks being so operated as to regulate the admission of air to the engine in an inverse ratio to the pressure in the tank, so that the speed of the engine would be kept up irrespective of the gradual diminution of pressure in the tank, until such pressure was reduced to nearly that of the atmosphere. The debate was shared by Messrs. A. W. Hall, Wm. B. Harrison and others;

Mr. Jas. Harrison called the attention of the members to a model embodying some very recent improvements in his machine for removing snow from streets and railway tracks, by melting. In this the snow being carried by conveyors to the flat top of a traveling carriage, is melted by jets of waste steam from the engine boiler, and by heat from a furnace applied to the flat top just mentioned. In the remarks drawn out by this device, the forcing downwards upon the snow of blasts of hot air, of exhaust steam, and of mingled steam and hot products of combustion from a furnace, were severally indicated as means by which the snow could be melted and removed from the street should the cost of fuel not be too great.

The Society adjourned for two weeks, with the announcement that at the next meeting the subject of "Sewers and Sewerage" would be taken up for consideration.

Railroads and Real Estate.—The Stockton and Tulare Railroad Company, Friedlander and others, will bring large tracts of fine agricultural lands (owned by some of the projectors of the company) within reach of the markets, and thereby greatly enhance the value of the same. A similar enterprise in the San Bernardino and Anaheim Landing Railroad Company, consisting of Holladay, Atherton and others. The idea is worth applying in hundreds of similarly situated land sections. Where the cost of a first-class railroad would not be warranted, roads of a cheaper character might be made to answer sufficiently the purposes of development. Engineers will do well to give some attention to the construction of cheap roads in this State—with wooden rails, perhaps, and light engines for local traffic.

Submarine Blasting.—The proprietors of the Giant Powder patent in this State have been making experiments in the blasting out of the submerged Blossom Rock in the harbor, which are claimed to be particularly favorable to the employment of that agent. It is found quite effective when discharged on the surface of a rock without being closed in a drilled chamber. Engineers are agreed that for the removal of large masses of rock and earth a slow acting powder is best, because it shakes and disintegrates the mass before it can escape, while a violent powder would make its way to the surface through one or more fissures, and spend much of its power in the open air.

A telegram from Shanghai, announcing the wreck of the steamer Benares, reached London, via Russia, in nineteen days—the quickest communication from China on record. It will not be long before the telegraphic connection with China will be accomplished, if not via Russia America, then via Russia or India; but the probabilities now are that English engineers will get the line up the Indus and down the Yang-Tze constructed long before the Russian American project will be resumed, or any Pacific cable undertaken. Where are Shaffner and Collins?

The Pacific Dredging Company has filed its certificate of incorporation, at a capital stock of $500,000, in 5,000 shares of $100 each.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent and correspondent for this paper. July 15, 1867.

Resident Agents.

HELENA, Montana.—R. F. MAY.

BLACK HAWK, C. T.—Harper M. Orahood.

CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.

GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.

DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.

CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

San Francisco:

Saturday Morning, Nov. 7, 1868.

Notices to Correspondents.

FURNACE BUILDER, Humboldt.—For the fusion of pure quartz a heat is required as intense as that which is given by the oxygen-hydrogen blowpipe; by which it can be melted into a transparent glass, and drawn into fine, flexible, elastic threads. In its purely anhydrous state, quartz is insoluble in water and all acids excepting the hydrofluoric. It is not volatile when heated alone, but, if accompanied by a current of steam, it will undergo partial sublimation, as is not unfrequently evidenced by the concretionary nodules sometimes found in the throats of furnaces, resembling in appearance ordinary caledony.

DYER.—Aniline colors are so called on account of the basis of most of them being formed of various degrees of oxidation of aniline, the basis of the coloring principle of indigo. These beautifully brilliant dyes are obtained from coal tar. It was Professor Hoffman who first pointed out this unwrought field. The practical benefits are traceable not only to the impetus given to inquiry by the above recommendation, but also to the recondite experiments made by that eminent chemist on aniline, its derivatives and compounds. Until the aniline dyes came into vogue, similar but more fugitive brilliant tints were obtained from lichens.

M. F. W., Sacramento.—We regret that we cannot refer you to any work specially devoted to *gold and silver mining*. There are several works on the reduction and metallurgy of these metals after their ores have been brought to the surface of the earth, or, to use mining language, brought to grass. But of *mining* for these metals *per se*, no work exists. Ordinary copper mining, however, greatly resembles gold and silver mining. Prof. W. W. Smith published, we believe, in London lately, a most excellent little work containing a synopsis of every description of mining. We suspect, however, no copy is obtainable in California. You will find some good remarks in Ures' Dictionary.

RANCHERO, Alameda.—Tobacco is one of the most, if not the most exhausting of crops, which an agriculturist can cultivate, as it carries away from the soil not less than 21 per cent. of the growth in the dried leaves, of which potash alone contributes one-third and nitric acid occasionally one-tenth. Our Chinese gardeners know how to make practical use of this fact, as the observer will find that with them tobacco stalks are extensively employed as a top-dressing in the suburban cabbage gardens.

S. G.—Pure iridium does not dissolve in oil of vitriol, nitric acid, or melted bi-sulphate of potash; the latter, however, slowly converts it into sesquioxide, without being dissolved or absorbed, which, when heated above the melting point of silver, becomes resolved into metallic iridium and oxygen.

G. R. W., Grizzly Flat, and WOOSTER, Santa Clara, next week.

Earthquake Philosophy, and Earthquake-Proof Building.

"What is your theory of earthquakes?" To this question a writer in the November *Overland Monthly* replies:

"You and I have no right to form a theory on the subject. It is the curse of scientific inquiry that you start with a theory built upon one fact; your theory is like an Irishman's wheelbarrow loaded with dirt: it is supported on one wheel—the rest you carry. They only are entitled to respectful consideration for their theories who have exhausted all the material of facts, bearing upon the subject, before fixing upon a theory. There are those whose opinions are entitled to the most respectful consideration, who for the last twenty years have been laboring to bring order out of chaos in the phenomena of earthquakes, to determine their laws, and by the aid of mathematics they have reduced their manifestations to an exact science, upon which they have bestowed the name of 'seismology.' This has been done while you have been speculating in stocks, trading jack-knives, or growing rich by the advance in water lots.

Mallet, Scrope, Dana, Deville, and older observers like von Buch and Humboldt, whose scientific lives and labors seemed to have grown out of the great contests which immediately followed the birth of Geology, between the Neptunians and Plutonians—the aqueous and the igneous theorists—have furnished us with a mass of interesting and relevant facts on the subject of volcanoes and earthquakes, concerning the intimate relationship of which no well-informed person can express a doubt; and the Physical Atlases of Bergbaus and of Black, contain dozens of elaborate charts, maps, graphic tabulations, plans and profiles, illustrating the laws which have been developed by the closest observation and thought of thousands of well-informed persons on the subject, for more than half a century. We designate the positive results arrived at in such cases by the short word "science," the signification of which is too often confounded with the very opposite of "theory," which is the especial field and province of uninformed persons, who are nevertheless quite frequently ready to argue their case, without having read the briefs. The writer above quoted continues, very much to our own way of thinking:

"It may be determined, for example, with great accuracy, from a certain number of observations within the circle of earthquake influence, what place is vertical over the focus or starting-point of the shock; and at what depth below the surface that force was exerted to produce it. And all the phenomena that follow are proper subjects for physical science and mathematics—whether they have reference to the crust of the earth, or the buildings constructed upon it; but the origin of the power which has produced these phenomena may be still a subject for speculation—whether to the snap and jar occasioned by the sudden and violent rupture of solid rock-masses (as is held by Scrope) or to access of a greater or less quantity of water to the red-hot lava of subterranean fires," (as is held by Mallet). * * * * There are some facts of practical importance that we should all know: that the primary shock, of which we have no warning, (either through the barometer, thermometer, or magnet, any more than through our eyes or nose,) is, when from a great depth, followed by second waves at right angles to it, like the waves when a stone is thrown into the water, and which are often more destructive to buildings than the normal shock. It is also known that the most destructive effects are felt on soil of low elasticity, as clay and alluvium, and least on firmest rock. The earthquake at Lisbon, in the space of a few minutes, destroyed sixty thousand lives in that portion of the city built upon the tertiary formations; *but not a building was injured on the secondary limestone or basalt.*" * * * * Other things being equal, the shock would be more severe on the alluvial formation around the bay than on the rocky ground."

Probably there is also some difference in the effect, attributable to the character of the rock, whether stratified, jointed and seamed to a great extent, or volcanic. It is the earthquakes that open the cracks and seams in the earth, which are afterwards filled with mineral deposits of the class known as true fissure veins.

No science exists which has not its immediate practical bearing, for its history will show that it was the latter invariably which furnished the clue to thinkers, and which gave the impulse to development. It seems to have been left to the Anglo-Saxon race to devise a system of economical earthquake proof building; for the Latin races still build, in Naples as well as in South America, with the simple floor timbers resting on fragile walls, serving as the best devisable trap for the mangling and wholesale slaughter of the devoted inmates. Worthy of consideration in this connection are the recommendations of a judicious citizen, Mr. George Gordon. He recommends alterations in the method of building, as follows:

First—That extreme care be taken with foundations, no matter whether on solid or made ground; let the entire bed-frame on which the building rests be a unit, like a ship's keel, and strong enough to bear twice the weight of the building if set up on posts ten or twelve feet apart, and so tied together that you could lift it bodily by a derrick from any point and swing it about.

Second—Dispense with the use of brick, stone or cast iron, except as an exterior protection against fire. Give these materials nothing else to do.

Third—Rely on timber and wrought iron entirely to carry the load and resist motion. Mortice all timbers and rivet all iron. Use boiler plate with angle iron riveted to it, above and below all openings, as sills and caps. No form of iron comeatable in this market is so simple, cheap and strong as these combined.

Fourth—Dispense with lathe and plaster, and face the inside walls, and make the ceilings with tongued and grooved lumber. Put up every board, and lay the floors so as to form diagonals—bracing in every direction. In nailing, put every nail square through the face of the boards, and discard the silly carpenter's foible of blind nailing.

Fifth—The lower the ceilings, and the more numerous the rooms in a building, the stronger is the structure.

The cost of such a building as I have been describing will not, including the foundation, exceed the cost of an ordinary building of the same size more than $1,500. My remarks, in this letter, are intended to apply to buildings of moderate cost.

For our comfort I will add a piece of information obtained from a friend. In one of the South American cities—I forgot which for the moment—there stands intact a dwelling house built to resist earthquakes. The city is a heap of ruins, but this house not only sustained the shocks unharmed, but was filled with the tidal wave without budging—an aggravation which cannot possibly happen to San Francisco.

On the same subject, the writer in the *Overland Monthly* exhibits sound judgment, and touches the true issue, in the following remarks:

"It is certain that entire safety may be assured to life and property on solid ground by proper attention to the construction of buildings, though we should have earthquakes as severe as are recorded; and it is as certain that all improperly-tyed walls, of poor mortar and as poor bricks, will be tumbled down to the peril of human life, as that earthquakes will occur, as they have occurred in the past. Especially should all walls with fronts veneered with stone be immediately taken down. It is mean and cowardly to patch up these structures and plaster up the broken chimneys, trusting that the shock that will hurl them to the dust will not come in your time, or until you have sold the property. The terror inspired by an earthquake is measured by the lives that are lost; and if a falling wall or chimney should invariably come upon the head of the owner, it would be a sad thing, but it would be infinitely sadder that the blameless should be stricken down by so unnecessary and reckless a cause. Architects are called to survey public buildings only to determine—not whether they are capable of withstanding a severer shock than we have yet had—but whether they are likely to fall without external aid. The street is barricaded until the rickety structure is secured; the workmen in the meantime trembling for their own safety. The dislocated chimney is carefully replaced, the fracture is pointed up with mortar, and the trap is set—for whom? Can there be no commission with power to command that all buildings and walls or chimneys endangering life, private as well as public, shall come down?"

Chemical and Metallurgical Works.

It is of the utmost importance to our new States and Territories, and to every individual interest connected with manufacturing and mining, that we should be up to the "times," and possessed of the latest developments of practical science and specialism in older parts, relating to chemistry and metallurgy—the corner stones of our industry and existence as a State, or cluster of States, beyond the condition of miserable hide-producing and potato raising ranches.

In mining and metallurgy, an indubitable want of confidence has existed on the part of a portion of the best working element for the development of the country in "scientific humbugs," such as Whitney, Silliman, and Blake, are honorably distinguished to be, not to mention a host of meritorious but less theoretic and more practical men, who are now engaged in out of the way districts, in furnishing soul to that branch of our industry. The existence of a few real, with not a few practical humbugs, argues nothing more than that a prevailing ignorance as to the genuineness of that kind of scientific merit which can make or save dollars, has permitted pretenders to thrive, and tempted some men of scientific acquirements to assume to be all that others have supposed them to be—oracle, alchemist and astrologer, in one. Such matters, however, regulate themselves very speedily. Capitalists find out soon enough the importance of fortifying themselves against foolish expenditures and investments; while the talkers subside as soon as the first case of real difficulty presents itself, and it is the unassuming practical men possessed of the requisite technical acquirements, who are, or ought to be, relied upon in the mills and mines. In manufacturing, on the other hand, little was ever risked to the luck, or trusted to the management of "genius." Experts are sought for and obtained at the very commencement, and chemistry and the practical sciences are acknowledged to be the foundation of every procedure.

Not a steamer lands from the interior, or from the northern or southern coasts, but brings to us in San Francisco one or many inquiring individuals, or expectant speculators, bearing with them a new or a refractory ore, an unknown mineral that is supposed to be of economical value, or some known valuable substance that is to be quantitatively determined. Usually these people try to find their way to capitalists at once, while they should go first to the technologists.

Concerning this indispensable class, consisting partly of professionally-educated gentlemen—technical specialists—and their establishments here and there in San Francisco, we propose to furnish our readers with a few facts, describing things and speaking of persons as we have found them.

THE PACIFIC CHEMICAL WORKS,

are located in that pretty large expanse of country—now all city—which is commonly designated as the Mission, corner of Folsom and Sixteenth streets. Louis Falkenau and Henry G. Hanks are the proprietors, and respectively superintendents of two separate departments, the former of analytical and manufacturing chemistry, the latter of assaying, metallurgy, paint manufacture, etc. Both are thoroughly informed, theoretically and practically, in their business, having gone each through his own proper "mill" to become so. Sage brush and laboratory experiences are happily blended. Nothing is manufactured here but articles that are demanded in the market, and in which competition from abroad would be an impossibility. The Works are not merely founded on a very sound and safe basis, but are certainly of such usefulness, in our progressing development, as to be deserving of every encouragement, being of themselves an important develop-

ment of manufacturiug on our coast; and furnishing articles in which the principal aim is to be at the head of the market by virtue of superiority mainly. Amongst the articles furnished are sulphuric ether, nitric and acetic acids, aqua ammonia, cyanide of potassium, and a great variety of industrial, photographic and pharmaceutical chemicals. Within two years and a half these works have been enlarged threefold, so that they constitute now the most complete laboratory on the coast, occupying a 50-vara lot adjacent to Mission Creek, with ample room accommodations for manufacturing on a large scale.

A walk through the establishment evidences recent progress, in enlarged apparatus, increased space, and in the multiplication of products for industrial uses; its origin dating from 1866. Furnaces, kettles, retorts, boilers, stills, evaporators, sandbaths, cupels, scales, steam engine, mills, glasses and bottles, are sufficiently descriptive of what one can see in the interior. Everything is done here pertaining to the science and art of chemical and metallurgical metamorphoses. Ores are worked experimentally, with a view to determine the best processes. Particular attention is paid to the analysis of ores, minerals, metals, etc. Raw products, animal, vegetable and mineral, left for examination, will also receive attention. Examinations in poisoning cases are made occasionally. The office of Messrs. Falkenau & Hanks is at No. 619 Montgomery street. Mr. Falkenau also has the official appointment of State Assayer.

KUSTEL & HOFMANN'S METALLURGICAL AND ASSAYING ESTABLISHMENT.

This is located at No. 611 Commercial street, above Montgomery, occupying two floors, and the yard in the rear. There is a gold and silver bullion and general assaying department; a metallurgical department for working ores up to 100 pounds by fire, or by chlorination, the tanks for which occupy considerable space; an analytical department, for determining the chemical ingredients and proportions of minerals and ores; and instruction is given besides, in chlorination more especially; improvements having been made therein by Mr. Kustel looking to economy in the use of chemicals, and in applying the manipulations of the process to silver as well as to gold ores, which is a very important matter for many mining localities. Kustel's reputation as a metallurgist and mineralogist stands deservedly high. Bred and educated in the Hungarian mining district and School of Schemnitz, and also a student of Freiberg, he is probably more thoroughly conversant with the methods in use and best adapted to the treatment of ores containing refractory ingredients, or located in countries with restricted appliances for metallurgy, than any one else in America, respecting either American or European processes, having been in the midst of Washoe doings and of our silver history from the beginning. We can scarcely realize, in these times, how much of our knowledge concerning the treatment of silver ores was originally derived from a few individuals. A handy "trick" travels from one mill to another with remarkable speed; and expense is no consideration when silver is the article in question. Kustel's work on American metallurgy is the standard, and only methodical book on the subject; it is treated with great respect by the highest European authorities. His work on chlorination is the only thing extant treating that subject fully, from a practical metallurgical stand-point. Concentration has also been treated upon by Mr. Kustel, in a tolerably complete work, which affords the only full information on that subject which can be obtained in the English language, though its contents are derived to a considerable extent from the exhaustive German treatises on the subject, principally from Rittinger and Gaetschmau.

Mr. Hofmann is a young graduate of Freiberg, and is conversant with every branch of mining and metallurgy, lacking only the many years of experience which are appropriately furnished by his senior partner. He is at present in Mexico, superintending the erection of chlorination works in the vicinity of Mazatlan.

FACTS FROM THE NEW SAN FRANCISCO DIRECTORY.—The new San Francisco Directory for 1868, compiled and published by Henry G. Langley, the editor of the "Pacific Coast Business Directory," "State Register," etc., contains the following facts of interest to our readers:

Population.—The total population is 147,950, of which only 138,950 are permanent, the remaining 9,000 being transient boarders, soldiers, sailors, etc. There are 52,300 males over 21 years of age, to 30,000 females over 18. The school census of July, 1868, counts the number of children under 15 at the extraordinary figure of 39,728.

City Improvements.—In its growth, San Francisco has spread during the past year in every practicable direction, the greatest expansion being necessarily towards the south and west. Many valuable improvements have, however, been made, meantime, along the city front, both on the north and east. The final adjustment of the question of title to the city's outside lands has given a fresh impulse to house-building in a westerly direction—while the more favorable conditions that exist for the establishment of manufacturing, mechanical, and other active pursuits, in the southerly part of the town, have led to the inauguration of many new industries in that quarter. Nearly every suburban town and hamlet, and even villages lying more remote, vitalized by her progress, have participated in this growth of the metropolis.

Grading was done by the city costing $468,735; paving, $172,088; planking, $237,482; brick sewer building, $237,798, etc., to a total of $1,511,486.66. The noteworthy new buildings are the new Merchants' Exchange, Mercantile Library, Hayward's insurance building, Y. M. Christian Association building, the new California Theater, the Alhambra and Bella Union theatres, new Chinese Theater on Jackson street, Platt & Brooks' Hall, Mozart Hall on Post street, Red Men's Hall on Bush street, and a great number of fine business establishments, churches, etc. Besides which there must be mentioned the California Market extension, the Mechanics' Institute Pavilion, the Pacific Rolling Mills at Potrero Point, the Selby Lead Smelting Works at Black Point, California Dry Dock at Hunter's Point, a Floating Dry Dock at North Point, etc. The number of new buildings is estimated at 975, of which 240 were brick. Total number of houses in the city 18,009, of which 13,912 are wood and 4,097 are brick.

Manufactures—During the past year, the manufacturing interests of San Francisco as a rule have been developing in magnitude more than increasing in number. The results, in the aggregate, have been very satisfactory to parties pecuniarily interested in these enterprises, while at the same time the public have not only been benefited by the larger volume of manufactures, steady prices, and the retention of coin for other purposes in this city, but a much larger field for labor has been opened up, the result of which is a healthy increase of a stable and valuable population.

Interesting facts are given concerning real estate, the extension of railroads, doings of homestead associations, etc. The Business Directory contains the names of nearly 18,000 firms, arranged and classified.

The Directory, as a whole, is one of the most complete editions ever published by Mr. Langley, and is worthy of our great and growing city. The facts and figures have been collected and collated by reliable statisticians and canvassers, under the personal supervision of Mr. Langley, whose large experience in this particular branch qualifies him for the work which he has just completed. It was printed by Bacon & Company, and is a credit to that well known printing establishment. Price, $5 in gold.

ENTOMOLOGY.—We have received Part III of *A Guide to the Study of Insects, and a Treatise on those Injurious and Beneficial to Crops*—by A. S. Packard, Jr., M.D., Salem, Mass. The work appears in monthly parts. It is beautifully printed, on the finest of paper, and is profusely illustrated with finished cuts. It is issued from the press of the Essex Institute. All those who have seen the articles in the *American Naturalist*, by Dr. Packard, upon subjects connected with his specialty, will know that such a work as this must be a most valuable one. The farmer, the horticulturist, the florist, and the housewife, all need such a manual. To each of these it is a matter of dollars and cents to become acquainted with the features, the habits, and the history of those insects which they must make war upon, and those whose acquaintance they must cultivate. To the student of entomology, also,—who, although he may have no crops to lose, takes up the subject solely for his own amusement,—it will be a welcome book. None know, by the way, the delight of such studies, but those who have tried it. These endure, with the utmost equanimity, the ridicule of those who laugh at them as "bug-hunters;" and as, microscope in hand, they sally forth into the rich world of delight which lies before, around, above and below them, they on their part can afford to indulge in a quiet smile of pity at the fools who are dying of *ennui* in the midst of such abundant resources for amusement.

The first number was issued in July. The whole will consist of eight or ten parts, at fifty cents each. Remittances and orders may be sent to the author at Salem.

MINING IN THE STOCK BOARDS.—There is no doubt that mining is now nearly brought to a legitimate basis in our midst, and nothing but the engrossing attention and promised rewards of other branches for the investment of capital, can delay mining stocks from taking their true relative dividend-returning position in the stock board. Out of one hundred and thirty mining enterprises represented in the Melbourne Stock Exchange, there are sixty-eight dividend paying quartz mining companies, and 31 dividend-paying alluvial mining companies; leaving twelve of the former and the residue of the latter and others, not paying dividends. Thus there is found in Australia a ready sale for the bonds of mining companies that desire to expend the sums borrowed in improving the mine by extended workings, and whose property is good security.

It is suggested by a city paper noted for its attention to mining matters—the *Alta*—that a reliable list be made of such of our leading gold mines as together will produce a steady flow of $25,000,000 a year, as a first step to the improvement of the condition of mining stocks in our stock board, and to the re-inauguration of a degree of activity in the formation of stock companies for legitimate mining.

SULPHURETS and rich Rebellions Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-a1m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.
☞FIRE AND MARINE INSURANCE. 10v14t9pqr

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

1 T
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and break-
ing out on any part of the
body, and also removes pain
of every name or nature instant-
ly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 339 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from ac-
tual tests.
8v17-3m

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

PACIFIC
Rolling Mill and Forge Co.,
SAN FRANCISCO, CAL.
Established for the Manufacture of
RAILROAD AND OTHER IRON
—AND—
Every Variety of Shafting,
Embracing ALL SIZES of
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames
—ALSO—
HAMMERED IRON
Of every description and size.
☞Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.
☞The highest price paid for Scrap Iron. 9v14m9p

A Book for Every Miner and Scientific Man.
JUST PUBLISHED,
KUSTEL'S NEW WORK,
CONCENTRATION
Of all kinds of Ores, and the
CHLORINATION PROCESS,
For Gold-Bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally.
Price, - - - - $7.50
A liberal discount to the Trade. For sale by the Booksellers
Sent to any part of the United States, postage paid, on receipt of the price. Address,

DEWEY & CO.,
American and Foreign Patent Agents,
Publishers and Proprietors of the MINING AND SCIENTIFIC PRESS, the only well established successful Patent Agents on the Pacific Coast, will give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.
Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Knox's Amalgamators,
WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequalled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

WILLAMETTE IRON WORKS,
PORTLAND, OREGON.

Steam Engines, Boilers,
SAW AND GRIST MILLS,
MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.
Corner North-Front and E streets,
18v13-1y One block north of Coueh's Wharf.

Globe Iron Works,
STOCKTON, CAL.

KEEP & BARGION,
MANUFACTURERS OF
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,
High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

FULTON
Foundry and Iron Works.

HINCKLEY & CO.,
MANUFACTURERS OF
STEAM ENGINES,
Quartz, Flour and Saw Mills,
Hayes' Improved Steam Pump, Brodie's Improved Crusher, Mining Pumps, Amalgamators, and all kinds of Machinery.
N. E. corner of Tehama and Fremont streets, above Howard street, San Francisco. 3-qy

McAFEE, SPIERS & CO.,
BOILER MAKERS
AND GENERAL MACHINISTS,
Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular **Boilers,** with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and and Marine Boilers, and Wrought Iron Tanks of every description.
Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, hight of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.
Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.
To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.
Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.
To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 1v16tf

UNION IRON WORKS,
Sacramento.
WILLIAMS, ROOT & NEILSON,
MANUFACTURERS OF
CROSS' PATENT BOILER FEEDER,
STEAM ENGINES, BOILERS,
And all kinds of Mining Machinery.
Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.
Dunbar's Patent Self-Adjusting Steam Piston
PACKING, for new and old Cylinders, manufactured to order.
Front Street, between N and O streets,
14v11 SACRAMENTO CITY

Oakland Point Foundry,
Near Oakland Point R. R. Station,

All work in their line attended to with promptness and dispatch. DIRECTORS—S. F. Butterworth, Lloyd Tevis, Jas. Pollock, Ben. Holladay, Chas. E. McLane, John N. Risdon, Joseph Moore, John N. Risdon, President; Joseph Moore, Vice President and Superintendent; Chas. E. McLane, Treasurer; Lewis R. Mead, Secretary; Lewis Coffey, Superintendent Boiler Works. 8v17-qy

Enterprises and Developments.

The lumber trade on Puget Sound maintains an unprecedented activity.

The Oakland planing mills commenced ruuning last week.

The steam-plow Mayflower is at work at Pacheco.

A coal mine has been worked at Chilliat, Alaska, to the extent of taking out sixty tons of coal. It is said silver lode has been struck on Wrangel Island.

Oakland Cotton Mills.—Work has been resumed at the Oakland cotton mills. The earthquake cracked the chimney and threw down part of the walls.

Cotton or woolen covered with oil which oxidizes rapidly when distributed thinly over a great exteut of surface, has often been the source of disastrous conflagrations.

Several flowing oil wells have been struck one league from the coast, in the State of Oaxaca, near Port Angel, Mexico. This strike has created quite an excitement in that part of the country.

John Wilson, of Salt Creek, Siskiyou County, last week returned from a hunting tour in the mountains of Klamath, Trinity and Humboldt, bringing with him fifty odd deerskins and six bearskins.

A company has been reclaiming Sherman Island, at the confluence of the Sacramento and San Joaquin rivers, containing about 13,000 acres. The company levied a tax upon the whole land of over four dollars an acre to meet the cost of reclamation. Two hundred Chinamen are at work, forming a broad embankment around the island, with a capacious drain ditch inside. Floodgates are being provided to relieve the ditches of water at low tide.

Coal Mining by Machinery.—At a recent meeting of the Institution of Mechanical Engineers, Leeds, a paper was read by John Fernie in which the objects to be gained by the application of machinery to coal cutting were stated to be: 1st, the cheapening of the work; 2d, the saving of a large quantity of coal, which, in the ordinary process of hoisting or undergoing by hand labor with the pick, is broken up into slack and dust; 3d, the removal of the danger attendant upon undergoing by hand labor; 4th, the getting a larger quantity of coal out of the pit; 5th, in the case of machines worked by compressed air, the collateral advantage of better ventilation and a cooler atmosphere in the mine, owing to the discharge of compressed air after each stroke of the tool. The machine traverses along the working face of the coal, and cuts out a horizontal slot or groove along the bottom of the seam of coal, or along a parting in the thickness of the seam itself. The work is at the rate of 8 yards to 12 yards per hour, including all stoppages, and undergoing the coal to the average depth of about 3 feet 4 inches in from the face. The work by each collier by manual labor is about 6 yards per day of 8 hours, undergoing to a depth of 3 feet in from the face. The machine, therefore, performs the work of from 12 to 18 men.

At Pittsburg, Pa., there is in operation a machine of this kind, which goes either by steam or man power.

To Preserve Shingles and Fence Posts. In a paper recently read before the Farmers' Club of the American Institute, J. B. Lyman says: "In using many kinds of wood, and especially chestnut and sappy pine, for shingles, pickets, trellises, etc., much durability will be gained by boiling in lime-water, or a weak solution of carbonate of soda. The boiling coagulates the most perishable parts, and the alkali corrects the acid of the sap, and prevents the growth of fungus. Whitewash is to be recommended as a valuable preservative of wood for a similar reason. Fence posts should be well seasoned and then treated by boiling the end to be set in the ground in tar or resin. For a foot each way from the surface of the earth, when set, fence posts should be well coated with a paint that will exclude water. Setting posts top end down does increase their durability. Painting green wood is worse than useless. It promotes decay by shutting out the air which would stiffen the albumen beneath the surface."

Dynamite.—The Prussian Government have just concluded an extensive series of experiments with dyuamite, and next month the French Government will follow suit. The verdict given by the Prussian Military Commission regarding dynamite is, that it is at least equal in power to ten times its weight in guupowder, and that it is the safest blasting agent known.

THE BEST IN AMERICA.
The Mining and Scientific Press,

Is the Oldest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, **414 Clay Street,** San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its SEVENTEENTH VOLUME, and enjoys a large circulation It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend the* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money orders.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the PRESS and Patent Circulars sent free.

DEWEY & CO.,

The Oakland Daily Transcript,

A BIT PAPER.

The Largest Circulation in the County.

Advertisements in the Transcript will reach every part of Alameda County.

RATES FOR ADVERTISING

VERY LOW.

A NEW PAPER
Will be published on SUNDAY NEXT, November 1st, to be called
THE SPIRITUAL LIGHT.
Published (for the present) Monthly.

It is especially designed to promote the cause of SPIRITUALISM, and assist in the discussion and investigation of all subjects pertinent thereto; which will naturally include Religion, Philosophy, Ethics, Morality and Universal Liberty.

TERMS OF SUBSCRIPTION.—One copy 1 year (invariably in advance) $1, Three copies to one address 1 year, $2 50. For convenience of remission, Greenbacks will (for the present) be received at $1 25 to the dollar in gold—we hope soon to be able to receive them at par.

TERMS OF ADVERTISING.—One square, one insertion, $1 (equal to 10 lines of ordinary brevier type); One square 3 months, $2; one square 1 year, $5; One column, 1 year, $25; do. 6 months, $15; do 3 months, $10.

A copy will be sent gratuitously on application to the publisher, to all places where one cannot be seen at the Bookstores. Address GEO. G. W. MORGAN, Editor and Proprietor, 472 Harrison street, between Third and Fourth street; or, 1578 Post Office, San Francisco. 18v17t

OIL STOVES!
MORRILL'S
Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, , re MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. RULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m

NOTICE.

TO ALL WHOM IT MAY CONCERN.—Notice is hereby given, that I am the first discoverer, first locator, and first Recorder of the Morey District, Nye County, Nevada, and I warn all persons from buying any interest in the said Morey mines until I prove my title to be perfect and lawful to said mines. THOS. J. BARNES.

Austin, Nev., Oct. 9, 1863. 16c17 1m

To Capitalists.

Two rich Gold-Bearing Quartz Veins—one of 6,400 feet, and the other 3,000 feet—situated in El Dorado County, about fifty miles from Sacramento, are offered for sale, under reasonable conditions For particulars, inquire at J. A. MARS', **512** California street, near Wells, Fargo & Co's, San Francisco. 18v17-4w*

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents

Changing the Address.—No charge is made for changing the address of this paper. BUERK'S
Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O Box, No. 1057. 23v16-6m

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge;* the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus debarring those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

Patent Rejections.

FIRST. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is ten weeks. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Candid Reasoning.

A gentleman eminent for his ability in all points pertaining to specifications, gives inventors the following sound advice:

To properly prepare a specification may seem a very simple and easy task, but such is not the case. It requires a knowledge of the arts, of science and scientific terms, and their proper use—of mechanics and the principles that govern their action—of law, and of the grammatical and legal force and construction of language, which is possessed by but very few persons.

Lawyers seldom possess the mechanical knowledge, while mechanics still more generally lack the legal knowledge necessary to enable them to properly prepare a case for examination.

It requires such a *combination* of legal and mechanical knowledge, together with a special knowledge of the principles and rules that govern the action of the office, that no person is really competent to undertake the business but those who *have made it a study, or had experience at it.* In view of these facts I unhesitatingly advise every person who has an invention worth patenting to get some responsible and competent agent to attend to it for him.

No person scarcely would think of entering upon a suit at law without employing a lawyer to attend to it, and make out his papers for him; and if a sensible man would not do that, much less would he attempt to prepare an application for a patent without knowing anything about the business.

I am aware that persons frequently attempt it, but I am also aware that *many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given when once rejected.*

Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their invention, and is therefore useless. It is for this reason that many applicants are compelled to reissue their patents at as great, and often greater expense, than the obtaining of the original.

Hence I repeat, every person having an invention worth patenting should employ a competent and responsible agent—I say *competent and responsible*, for, unfortunately, there are many who are neither competent nor responsible.

If worth filing at all, these cases should be prepared with very great care and caution.

One intentor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented, or "Patent applied for."

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexations delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a SPECIALITY of legal jurisprudence; or, as Mr. Phillips, an eminent patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* and *experience.* As agents with such qualifications, we solicit honest patronage.

Re-Issues.

When, through "inadvertence, accident, or mistake," an *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can be cured by a *re-issue.* In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground lor asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Illustrate your Innentiovs.

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

To Eastern Inventors.

Our close proximity to Mexico, Australia and the Islands enables us to obtain Letters Patent for you with much less *delay* and expense than they can be secured through any other agency in the United States.

Comparatively few inventors seem to be aware that Melbourne, in Australia, is a city nearly double in size to San Francisco, besides the adjacent colonies of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,

REMOVAL.

THE

MINING AND SCIENTIFIC PRESS

(Patent Agency, Newspaper and Job Printing Office)

Will be REMOVED this day from No. 505 Clay street to

No. 414 Clay Street, below Sansome,

About one-half block east of our former location.

August 5th, 1868. **DEWEY & CO.**

ATTENTION.—Virginia City, Aug. 9th, 1868—Dewey & Co., San Francisco.—Gents:

The Patent, enclosing your favor with Inventor's certificate, etc., came duly to hand, and for which please accept my grateful acknowledgements.

I am pleased to learn that the business of your agency for Patents, etc., is rapidly increasing. This is as it should be. Your promptness, fidelity and skill, as Patent Agents, entitle you to public confidence and patronage.

I can see no good reason why Inventors on the Pacific Coast should employ agents in New York and other Eastern cities to transact their business at the Patent Office, when we have among us those equally qualified by long study and large experience.

Yours truly, J. A. C.

New Mining Advertisements.

Chihuahua Mining Company—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of November, 1868, an assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. n7

Senator Silver Mining Company.—Location of Mine: Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1868, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourth day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-fourth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. oc7

Mining Notices—Continued.

Cordillera Silver Mining Company, Morello District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of October, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

San Francisco, Oct. 10, 1868. oc10

Machinery.

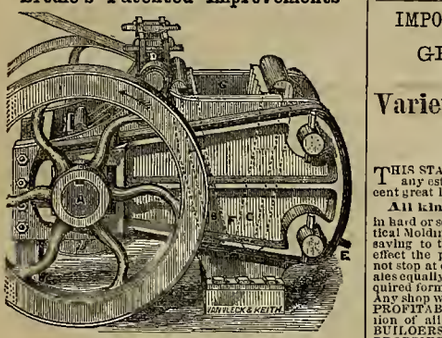
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1vl San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BROOIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BROOIE'S PATENT WIND-BLAST SEPARATOR FOR ORY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

IMPORTANT TO LUMBERMEN.

ANDERSON'S
Patent Mulay Saw Hangings.

These Mulays will cut FIFTY PER CENT. MORE LUMBER PER DAY than any other Mulay in use, with fifty per cent. less power. They are very durable, and easily kept in order, and warranted to give satisfaction. No Mulay Mill should be without them, as they will pay for themselves in a very short time. No other mode of manufacturing Lumber can compete with the Mulay Saw with this improvement. Send for circular. FULLER & CO.,

Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

HYDROSTATIC WORKS.

SAN FRANCISCO

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Hoses and Hose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞I also keep all kinds of COUGLASS and other makers' Pumps on hand. 11v17-tf

IS ON THE COVER OF THE PACKAGE

NONE OTHER IS GENUINE.

FOR SALE IN EVERY STATE IN THE UNION.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address OSWEX & CO., Mining and Scientific Press office, San Francisco.

BY MAIL.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of the old and new location, and the paper will be sent accordingly.

NEW ZEALAND GOLD FIELDS.—The London *Mining Journal* has a letter from the new gold region, a portion of which we quote: The gold fields extend from Cape Colville, through Coromandel, the true El Dorado, 20 miles inland. Nearly the whole of this territory belongs to the natives, who have leased a portion of it to our local government. There is no approaching it except seaways, the jealously of the natives making it too dangerous for visitors to avail themselves of the shorter land route. Every miner pays 20s. for his license, 15s. of which is handed over to the proprietors of the soil. Upwards of 6,500 of these licenses have already been granted, and it is believed the number will exceed 30,000 before the close of the summer. For the above fee of 20s. the digger is put into possession of a strip of land 150 feet in length by 50 in width. This is called the "claim." But the usual practice is for three or more to associate, and secure between them a larger extent of ground, each paying, of course, for a separate license to work. In one of the earliest claims thus obtained, belonging to three individuals, a fourth share was almost immediately disposed of for 2,250*l.*, and 25,000*l.* more was afterwards offered, and refused, for the whole lot. Limited as its area is, nobody doubts that it contains metal to the value of 1,000,000*l.* sterling. The four lucky fellows are laboring upon it themselves. No other claim approaches this in value, yet there are many yielding to their owners 200*l.* and 250*l.* per week. The quartz throughout the district certainly averages 12 ozs. of gold to the ton. Prospecting parties are at liberty to select for themselves within the proclaimed area any unoccupied spots. All that they then have to do is to pay off so many claims, according to their numbers. These companies are generally limited, too; in no case, at all events, do they exceed 20 members. After receiving his license the adventurer must be daily on the ground and at work, or provide a substitute, otherwise his claim may be "jumped"—that is, forfeited to the first comer, he being himself a licensed miner, who discovers it "idle."

GOVERNMENT AND THE FORESTS.—In France and Germany forestry is one of the state professions of the highest character, and regularly filled from the better and educated class who are trained for that purpose. France has 2,700,000 acres of state forest, revenue £1,740,000, in the conservation and management of which £500,000 is annually expended. Prussia has 5,070,000 acres, Bavaria 1,962,000 acres, while the forest area of Austria is 13,000,000 acres, with an export value of £3,000,000 sterling annually realized. Systematic conservation in Europe has restored forests to an area of correct proportion to the cultivation of the country, and secured a supply for profitable exports.

England has taken steps to save the teak and sal forests of India by putting them in charge of a special department of the government. There were in 1830 probably 4,000 square miles of purely sal forests along the foot of the Himalayas, besides those in Central India available to the government. The sal timber is almost the only one found capable of standing the Indian climate for railway purposes; yet now the East Indian railway has been obliged to import pine sleepers from Norway, sal being scarcely procurable.

On our western half of the American continent forests are the exception instead of the rule as in the East and in Europe. In due time the agricultural societies will undoubtedly take steps to induce the Legislature, or Congress, to do something for the perpetuation of our forests.

GOLD AND SILVER PRODUCT OF THE WORLD.—The *Banker's Magazine* estimates that from 1492 to 1848, the yield of the world in gold and silver, was equal to $8,300,000,000, of which $2,261,000,000 was in gold, and $5,678,000,000 in silver. But the proportion of gold to silver has greatly changed in recent years, so that from 1854 to 1868, of $5,574,000,000 of the precious metals, $3,379,000,000 were gold, and only $2,194,000,000 silver. It is supposed that Europe and America possessed, in 1848, $6,000,000,000 of gold and silver, of which $1,900,000,000 were gold, and $4,100,000,000 silver.

A New Treatise on Concentration of All Kinds of Ores.

INCLUDING THE CHLORINATION PROCESS FOR Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally, by GUIDO KUSTEL, M. E. & M., author of Nevada and California Processes of Silver and Gold Extraction—120 lithographic diagrams.

OPINIONS OF THE PRESS.

KUSTEL'S NEW WORK.—Mr. Guido Kustel has just put forth another volume, a copy of which we have received from the publishers, Dewey & Co., San Francisco. The book contains 120 diagrams on seven plates. In issuing the work, the design of the author appears to have been to exhibit the present state of the art of concentrating ores as practiced in the older and more experienced mining sections of the world, as well as in the more recent mining operations in California. The principles on which the system of concentration is founded are stated without entering into scientific reasons.

The dressing of ores is treated at great length, and the plan is based on these principles: "1st. Each constituent of the mass of ore must be brought to the highest value which can advantageously be given to it. 2d. The useful minerals must be concentrated only to the most advantageous degree of purity; and, 3d. All loss of the quantity and value of the useful mineral must be avoided as far as practicable." Reduction in its diversified modes—by rock-breakers, stamps, rolling mills, and grinding in arastras, pulverizers, Chili mills and pans—necessarily occupies large space by reason of its importance.

The plan of reducing ores by stamps, in either the wet or dry process, forms a complete treatise of itself, and may be studied with advantage by all persons connected with reduction works of that character. Concentration of gold ores is specially treated in section 49, and of silver ores in section 50. The latter subject should possess interest for our millmen and miners, as the plan of concentrating ores is certain to be resorted to as soon as the business is understood and reduced to a system.

The sections of the work devoted to the extraction of gold from sulphurets, arseniurets, or quartz, by chlorination, are based on Plattner's process of the property of chlorine gas to transform metallic gold into soluble chloride of gold. By this process it has been demonstrated that gold is extracted perfectly. Our author says the process was first introduced into Nevada, California, in 1858, where there are several establishments in successful operation.

The process of chlorination is described in the fullest manner, and embraces a particular description of the various roasting furnaces in use, as well as of the operation of roasting.

We commend Mr. Kustel's treatise to the attention of all concerned in the business of mining and reducing ores, to whom it must prove a valuable hand-book of practical knowledge.—*Daily Reese River Reveille, Jan.*, 1868.

Price of the work, $7.50. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS, San Francisco, who will supply orders, by mail or express, at wholesale or retail.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

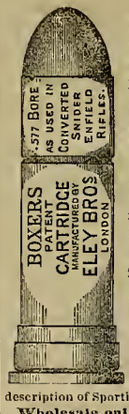
Cocoanut Matting, Rugs, Mats, Etc.
And Cocoanut Fiber for Upholstery.
South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purposes:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.



3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 M, 9 M, and 7 M, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Nov. 2, 1868.

The Vice-President, Dr. J. G. Cooper, called the meeting to order. President Dr. James Blake afterwards came in and took the chair. Twelve members present.

Elected resident member, Amos Bowman.

Mr. Bloomer moved that the Academy adjourn on account of the small attendance and political excitement prevailing. Mr. Gregory Yale objected, and spoke of the necessity of obtaining reliable information in regard to the earthquake, stating also that the public expected something from us on the subject.

Dr. Jas. Blake explained that it is not our province to advance theories as to the cause of earthquakes, as that had been done by men who had made these phenomena a life Time is required to collect facts and obtain reliable information on the subject, and when this is accomplished, the results will be given to the public. We cannot accept newspaper and second-hand reports, and jump at conclusions therefrom, but must wait for scientific investigations.

Dr. Blake inclines strongly to the terrestrial theory of gaseous eruptions and explosions. There are usually two waves in an earthquake; one which moves vertically directly towards the surface, and one which spreads out horizontally from this on the surface, radiating from the center. It is the last, or undulatory shock, which does most damage. On Sunday evening, Oct. 25th, we had these two very distinctly illustrated. The geological formation of the surface has nothing to do with the cause, although a shock is transmitted with three times the velocity and severity through granite or hard rock that it is through sand. Hence, it is safer in this case to "build your house upon the sand" overlying a solid base. The center of our heavy shock was probably a few miles to the north of Hayward's. In this place houses had been moved bodily from their bases; one two feet to the southward; another near by two feet at right angles to the first, and still another eighteen inches up a slope in an opposite direction to the last. All the waves seem to converge toward the San Ramon Valley, to the north of Hayward's. Dr. Blake and others are going to continue their investigations.

Col. Ransom offered the following resolution, which was not acted upon but laid over until the next meeting:

Resolved, That a committee, to consist of the President, Gregory Yale and Dr. J. G. Cooper, be appointed to collect facts connected with the recent earthquake in this vicinity, and that they report the results at some subsequent meeting of the Academy.

WHITE PINE.—All of our Nevada exchanges come to us plethoric with accounts of the extent and richness of the mines in White Pine district, in that State. There is now no doubt but that these mines are yielding an immense amount of silver, as will be seen by referring to our weekly Mining Summary. This is one of the benefits we derive from the Pacific Railroad. It opens up the country to prospectors, and we would not be surprised to hear of similar mines or deposits having been discovered in numerous places along the road. The Austin *Reveille* of Oct. 27th, gives the following exciting account of the mines and manner of working them:

The excavations of the miners, which are of every form and of different dimensions, are necessarily close together; in some instances they are only a few yards apart. These openings vary in depth from a few feet to 20, 30 and 40. In every instance, pockets or bunches of good ore have been struck in these excavations; and in several cases the ore is equal to that produced by the most famous claim in the district. Some claims, as the Stonewall, have large piles of valuable ore upon their dumps. The work in these multifarious mines is carried on with unexampled vigor, and the limestone crown, which covers the rich deposit of silver, is buffeted lustily by stalwart arms. "Why," said the talker from White Pine, "as many as 40 shots may be heard in an hour. Little else is heard during the day but the blows of the sledge and the exploding blasts. In some net-work of claims, where the limestone has been cut only a few feet below the surface, there is danger from the fragments thrown out by the blasts; and when the fuse is lighted, 'look out!' is shouted sharply, and a score or two of men, who were before hidden, jump out of their holes and run to shelter with amazing vivacity. That was the way at first; but as the men lost too much time running and dodging every time a blast went off, they contrive now to set off their blasts about the same time. It's a wonderful place. In my opinion, Chloride Flat is a vast basin of rich silver ore, into which every poor man may dip his iron spoon and help himself."

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

CALIFORNIA
BUSINESS UNIVERSITY.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

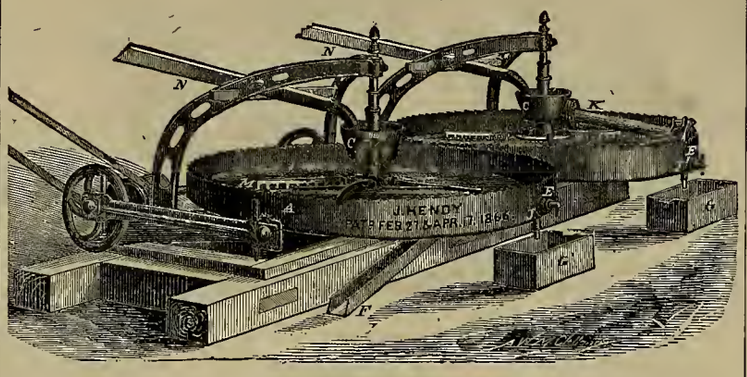
This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.



The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

---

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It has donned a new-style hat; or, in newspaper parlance, a new heading, which gives it the solid, scientific look it merits. Other improvements typographical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868,
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.

A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made
Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK:

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR NOVEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

Nov. 6th—CONSTITUTION.....Captain W. H. Hudson. Connecting with ALASKA, Capt. Gray.

November 14th—GOLDEN AGE.....Capt. W. F. Lapidge, Connecting with OCEAN QUEEN, Capt. King.

November 21st—COLORADO.....Capt E. S. Fainsworth, Connecting with HENRY CHAUNCEY, Capt. Connor.

November 30th—SACRAMENTO.....Capt. W. H Parker, Connecting with ARIZONA, Capt Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Dorne, will be dispatched on SATURDAY, October 3d, at 12 o'clock M., from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

MILLS FURNISHED AT SHORT NOTICE,
At the lowest Market Prices.

AMERICAN
(WALTHAM)
WATCHES,
THE BEST!
THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all those respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first-class dealers in the United States and British Provinces.

METALLURGY IN COLORADO.—The only method of treating the Colorado sulphurets which has given satisfactory results is smelting, but that has been found practically too expensive, except for rich ores and tailings. Prof. Hill, of the Central City Smelting Works, has recently erected smelting works also at Black Hawk. He roasts the rich ores in heaps, the lumps being broken to about the size of the fist; a heap of fifty or sixty tons is piled up on a stratum of billets of wood, a funnel is left in the center to fire the wood through, and the whole heap is covered with a layer of tailings from the stamps. The fuel is consumed in about twenty-four hours, and then the sulphur and other combustible portions of the ors continue burning for several weeks, and are finally expelled. The ores are reduced in a reverberatory furnace, the hearth of which extends to a length of some twenty yards. They are first introduced at the end farthest from the fire, and are gradually pushed on towards the heated portion. A copper matte, with which the gold and silver is combined, is formed in the furnace, and this Mr. Hill finds most advantageous to ship to Swansea for refining and extraction of the gold and copper. In consequence of the failures of amalgamating processes for the extraction of the gold combined with the sulphurets of iron and copper, the miners have reverted to the old system of passing the pounded ore from the stamps over amalgamated copper plates, and in some mills, after passing from these, it falls on percussion tables, the bottoms of which are formed of corrugated copper plate, also covered with a coating of mercury. This extracts any free gold which may have escaped on the fixed plates, and gathers in the grooves some of the richest portions of the tailings. Probably more than half the gold is lost by this system, which, if it has no other merit, can claim that of extreme simplicity. Sometimes the tailings are saved, and, if rich enough, are treated in pans or are smelted. This may be considered the result of ten years experimenting on the refractory gold ores of Colorado.

MECHANICAL MOVEMENTS.—We have received a second copy of a valuable book for mechanics entitled "507 Mechanical Movements," by Henry T. Brown, of the *American Artisan*, New York, which work was noticed in our issue of Aug. 8, 1868. For sale by Fuller & Co., 109 Montgomery street. Price, $1.

White Pine—Ore Deposits and Geology.

It is evident that the hidden stores of metallic wealth in our silver and golden veins whose magic influence has developed, under the reader's own eyes, the almost boundless energies that the human mind and body, and that individuals and communities are capable of, have not been exhausted, and will not be till the Pacific Railroad and possibly the Darien Canal shall have become old and threadbare facts. It is these resources and the calling into exercise of such energies, that creates giants and heroes in our time, and far down into the future generations of our Pacific Slope will the traces of the generous influences of the mountains and of our smiling subterranean treasures, mark themselves in the peculiar characteristics of the people.

Fig. 1.

No sight can be more edifying than a genuine mining excitement, based upon something real, for it is there where the most refreshing originality of character and the most remarkable individualities develop themselves; where an old sailor becomes Mining Engineer and Mayor of a mountain city, at the same time that he will persistently adhere to his nautical old four hours habit of sleeping and waking "watch and watch;" where prospectors, out of reach of the shoe market, will travel in gunny bags, with a contempt for distances and looming mountains and storms, such as would have won the most complete respect from tough old Ganger Rolf himself; where uneducated people sometimes observantly think themselves into a correct appreciation of the principles of geology such as would put the scientific possessors of communicated knowledge to shame; where every element must bend or give way to the play of human will; and where character everywhere ripples and dashes forth as freely as the brooklet tumbles down a mountain's side.

Fig. 2.

Very agreeably to us a breeze from White Pine came yesterday bringing to us some tangible information of the kind we were in need of, in the shape of a visit from, and a conversation with, the indefatigable Major Sherman, whose career is so intimately identified with the history of silver mining in Nevada. Shermantown, the future city of White Pine, will commemorate his connection with the first notoriety of these mines, since June last—the town lots of which burg were sold for the benefit of a free road to the mines.

What is the nature of these deposits? To this question the answer will be best illustrated by the annexed sections, drawn lengthwise (a distance of 1¼ mile north and south) and crosswise, of Treasure Hill.

According to information heretofore obtained, the deposits thus far worked at White Pine have been described by us as chiefly surface ores and infiltrations, though it was surmised that regular veins would be found to exist in connection therewith, whence the material of the superficial and horizontal deposits was derived. The occurrences in Derbyshire were adduced as an example where true fissure veins and horizontal infiltrations existed extensively together; and Reveille District was cited as an example of the latter, without our being able to give any definite information of the existence of the former, though it may be confidently accepted that the argentiferous solutions everywhere must have traveled through subterranean fissures previous to their deposition at or near the surface.

There are two general directions to the locations and deposits on Treasure Hill, (White Pine), according to Major Sherman's testimony. They are represented by our two sections, from north to south, and from east to west. It would seem that they are ranged along a series of genuine fissure veins, parallel to each other, which exist along the top of the hill, running north and south, (like Fig. 1) and also on the eastern side, while at the southern end of the hill there is the Eberhardt and a parallel series of veins running square across the above mentioned, or east and west, (like Fig. 2). It is maintained by Sherman and others who have given the matter close attention, that these are one and the same series of veins, which make a turn easterly and northerly of the Eberhardt, in the manner indicated by the arrow in Fig. 2; but the supposition is not at all necessary, and systems of veins are much more likely to cross each other than to bend aside in a uniform manner to pursue a different direction—because the forces which opened the fissures operated in straight lines. In the direction of or parallel to Fig. 1 are the Aurora, Hidden Treasure, and a dozen other *named* ledges, a few of which are indicated in the cross section, Fig. 2, and about which there are disputes, and lawsuits,—for the simple reason that the mines have not been opened sufficiently to distinguish the horizontal from the vertical deposits. In the direction of or parallel to the cross section, Fig. 2, are the Eberhardt, Argyle, the Irvine, a mile and a half to the south, etc.

The walls in the Eberhardt, running east and west), and in the Hidden Treasure (N. & S.,) we are told are perfectly defined; a little ragged as far as gone down, but regular, and often smooth on both sides like a whitewashed wall; clearly separated from the chloride ore, and not discolored thereby. "Slickensides" do not exist, a fact which may be accounted for by the nature of the magnesian limestone.

On the top of the hill, in the Aurora and Hidden Treasure mines, the dolomitic limestone crumbles more easily than it does in the Eberhardt, but the ore channels are equally regular. At no place have the miners yet gone down more than 30 feet, so that the data concerning the probabilities of contraction or of the splitting up of veins, are not yet within our reach. The width of the Eberhardt deposit is 180 feet. The continuance of such a vein to any depth would certainly be the most remarkable as to size yet discovered in this country, if not in the world. There is exposed to the sight a deposit as large as Wells, Fargo & Co's building in San Francisco.

The parallelism of other series of veins running in the same directions, if sufficiently established, would furnish the most positive evidence of the existence of deeper ores and true fissure veins throughout the entire district.

But the characteristic and most remarkable feature of the White Pine chloride deposits is illustrated in the cross section, Fig. 2. The limestone strata dip 10 or 15 degrees towards the west. From the veins underneath Chloride Flat, c, c, and to the eastward of Chloride Flat, there is a regular system of overflows from the veins or channels of metal into the interstices of stratification in the limestone; always on the lower or western side as represented, and never on the eastern side of the veins. Miners blasting down through the shaded capping, a, a, find nearly everywhere floors of chloride of silver of varying thickness, from thin sheet to a number of feet in dimensions, and the distances apart of these floors also varies greatly, generally from two to eight feet. The uniformity and extent of these infiltrations is remarkable. The superficial area of the locality known as Chloride Flat, is about 400 yards square.

DARIEN SHIP CANAL.—The newspapers are gaining faith that the Darien inter-oceanic ship canal is really to be dug within a few years, since Seward, Peter Cooper and others have interested themselves in the matter. Like the Pacific Railroad, the Darien Canal is a desideratum certain of speedy attainment as soon as the work is once fairly taken hold of. It will be another of the great historical consequences of the settlement of Oregon and California.

A MODEL PAPER.—Conspicuous amongst the many daily papers on this coast, published outside of this city, is the Virginia *Enterprise*. A glance at its well-filled pages is sufficient to prove its superiority. Published in a noted mining district, it labors to further the mining interest. We are always sure of finding something of interest in its columns, and would find ourselves lost without it. Long may it wave!

VOLCANIC.—It is reported that Mount Hood, Oregon, has followed the example of Mount Baker, W. T., and taken to smoking, and showing other signs of activity.

DIRECT trade between New York and Portland, Oregon, is now inaugurated by the vessels Sally Brown, Hattie Reese, and Oregon.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Metallic Deposits—Gold Nuggets—Theory as to their Formation.

BY DR. LANSZWEERT.

Mr. Cosmo Newberry (before the Royal Society of Victoria), continued his remarks as follows:

Prof. Bischoff has detected the occurrence of gold in meteoric waters, and by experiment he found it was slightly soluble in pure water. Once formed and present in the water, it is, like all other gold salts, easily decomposed. In an experiment I have made, the sulphide of gold was held in solution by a small quantity of an alkaline bicarbonate. A cube of iron pyrites and a chip of wood were introduced, and in a few days small irregular grains of metallic gold were deposited on the pyrites. What part the organic matter took in the reaction is not clear, but the gold was not deposited in the absence of it. In Mr. C. Wilkinson's paper a series of experiments are described in which gold was deposited in the metallic form upon a nucleus from a solution of the chloride by the reducing agency of organic matter—the nuclei being either gold itself or iron, copper, and arsenical pyrites, galena, zinc blende, sulphide of antimony, etc. Organic matter has long been known as an agent for precipitating gold in the metallic state from its solutions. Rose states that oxalic acid precipitates it in metallic laminæ. * * * But it was not known until the experiment of Mr. Daintree, and the following ones made by Mr. Wilkinson, that the deposit would take place on a nucleus, and be continued as long as gold remained in solution. If their action went on in the drifts it would account for the greater purity of the gold, and for the nucleus of brown iron ore so often found in nuggets and crystals. Strong solutions of gold immediately begin to decompose the pyrites, and interfere with the regular deposition of gold by a strong solution. I refer to one containing more than one grain of chloride of gold to an ounce of water. A weaker solution than this also decomposes the pyrites, but so slowly as not to interfere with the deposit taking place regularly. All the other sulphides are also decomposed. In the experiment in which galena was used as a nucleus this decomposition was best marked. Somewhat more than a year ago I placed a cube of galena in a solution of chloride of gold, with free access of air, and put in organic matter. Gold was deposited as usual in a bright metallic film, apparently completely coating the cube. After a few months the film burst along the edge of the cube, and remained in this state, with the cracks open, without any further alteration in size or form being apparent. Upon removing it from the liquid a few days ago and breaking it open, I found that a large portion of the galena had been decomposed, forming chloride and sulphate of lead and free sulphur, which are mixed together, encasing a small nucleus of undecomposed sulphide of lead. The formation of these salts had exerted sufficient force to burst open the gold coating, which upon the outside had the mamillary form noticed by Mr. Wilkinson, while the inside was rough and irregular, with crystals forcing their way into the lead salts. Had this action continued undisturbed, the result would have been a nugget with a nucleus of lead salts; or, if there had been a current to remove the results of the decomposition, a nugget without a nucleus of foreign matter. If, instead of galena, we had had a piece of pyrites to start with, the decomposition would have gone on in the same way, but the result would have been brown iron ore in place of lead salts. This decomposition gives a very simple means of accounting for the oxide of iron so often found in the nuggets and crystals of gold, the latter especially, as shown by the experiments of the late Dr. Becker, by cutting them in halves, and by their established low specific gravity, and their loss in weight suffered in smelting. Finding the brown iron ore of the miocene drifts contained gold, I was led to suppose that, though I could not make gold deposit on it, I might succeed in making them deposit together, which was the case. I arranged a mass of sand with chips of organic matter in it in a vessel, and slowly filtered through it a dilute, nearly neutral solution of sesquichloride of iron, containing a few drops of chloride of gold, and as it passed through repeated the dose. This continued for some weeks without any appreciable change taking place, but after some months thin bands of hydrated sesquioxide of iron began to form across the mass about the center, parallel with the surface. * * * Though the processes I have described will account for the formation of nuggets, it does not account for the appearance of gold in pyrites. I have examined about 100 samples, in none of which do I find any tendency on the part of the gold to assume the form of a coating, it being usually in irregular grains and small octahedral crystals, seldom to be detected, even with the aid of the microscope, until nearly all the pyrites have been oxidized and decomposed. In a few exceptional cases, pieces have been found projecting, but all tends to prove the priority of the deposition of the gold, and that instead of pyrites having formed a nucleus for the gold, the reverse has in a majority of instances been the case. It may also have been the first to deposit in the drift wood, for in all the experiments by Mr. Wilkinson and myself, the organic structure became so impregnated with gold that when ignited (so as to burn off the undecomposed organic matter) a golden model remained. Conditions such as these (before ignition) would be very favorable to the formation of pyrites, offering to a ferruginous water containing sulphates a reducing agent and a congenial nucleus for the crystals to form on. Crystalline gold is very easily made, by simply introducing a chip of wood into a solution of chloride of gold containing five or six per cent. of the salt. The crystals are first seen on the surface of the liquid as a thin film, which, as it grows heavier, falls to the bottom, where it assumes a moss-like appearance. If this is examined under the microscope, it will be found to be a network of octahedral crystals, resembling very closely the gold crystals from pyrites. In these experiments, as in all the others, organic matter is necessary, the action ceasing when it was removed, starting again immediately with a fresh addition. These experiments are based on the assumption that the gold exists in the pyrites in the metallic form, and not as sulphide, as has been supposed to be the case by some. * * * Prof. Bischoff suggests silica as the medium for the transmission of gold to the quartz reefs. Gold, as he points out, certainly has a great affinity for silica, always being found in connection with it in mineral veins in the drifts, and even in the pyrites, where I have always found silica as grains and minute nearly perfect hexagonal crystals, the occurrence of which I have always been at a loss to account for. The Professor's experiment is a very instructive one. He reports it as follows:—"On adding to a solution of chloride of gold a solution of silicate of potassa the yellow color of the former disappears. After half an hour the fluid turns blue, and in time a gelatinous dark blue precipitate appears, which adheres firmly to the vessel. After the lapse of some days moss-like forms are to be seen on the surface of the precipitate like an efflorescence. On exposure to sunlight no reduction takes place, but after the lapse of some months, if the precipitate is allowed to remain undisturbed under water, a decomposition takes place, and in the silicate of gold appear minute partly microscopical specks of gold." If this is the method by which the gold reached the quartz lodes, as this professor argues, the origin of the silica is also that of the gold. The origin of the former we believe to be the silicates of the rocks, by the decomposition of which the silica is conducted to the lode cracks. In these silicates we have therefore to look for the gold, and it is possible that it is contained in them as silicate. To prove this is almost impossible, even if we found the gold; for it must, if present at all, be in a quantity too small to determine whether in combination or not. Silicate of gold is extremely insoluble in water; but if we assume that its solubility is in the same ratio to the solubility of silica as the gold of even our richest quartz reefs is to the silica in the reef, we will find no difficulty in believing this theory is possible. In several instances an amathestine color has been observed in both quartz reefs and the washdirt of the drift. Mr. Alpin tells me that he observed in a lead near Beechworth this color in the washdirt. In the mine no gold was to be seen in it, but on bringing it to the surface and exposing it to the air the color disappeared, and the dirt was found to be full of very fine gold, which looks very much as if there had been a compound of the gold with some other substance. Ulrich some years ago was told by Mr. Clement, a successful quartz miner, that in the center of the German Reef, Maldon, some seventy feet from the surface, where the quartz was ten feet thick, he observed dark blue clayey bands, portions of which on being brought to the surface and exposed lost all color, and were found to be full of very fine gold. Be this as it may, there can be no doubt that nearly all the native sulphides contain gold, especially those which also contain silver. I have found it accompanied with this metal in every sample of iron, copper, and arsenical pyrites, galena, sulphide of antimony, and zinc blende, which I have examined from the rocks of this colony; and Dr. Percy proved its existence in every sample of galena he examined, even though they contained little or no silver. Bischoff, in reviewing facts like these, says that it has been repeatedly proved that in the decomposition of ore lodes the silver takes part in the oxidation processes, and is removed in soluble combinations. * * * If further experiments prove that alkaline silicates favor the solubility of silicate of gold, the silica theory will be open to but few objections, and the difficulties to impede our progress in solving this most interesting problem of chemical geology will be greatly diminished.

[Written for the Mining and Scientific Press.]

Mining in Sierra County.

SIERRA CITY—THE BUTTES MINE.

This place promises to become a lively mining place. Until now no other mine besides the famous Sierra Buttes mine above town, was opened. This pays regularly from $38,000 to $45,000 at each clean-up, about five weeks' run of two mills. The lower tunnel on the level of the upper mill is finished, as they have found the ledge, and commenced drifting now. Mr. Ferd. Rice will go (after the election) to the Eastern States to spend the winter. The mine gives employment to 65 men. A wagon road is projected from Sierra City to Milton's, and in this way a connection with the railroad will be made. A good many mines in the vicinity of the Sierra Buttes are now worked, and all of them appear to be very rich. On the east side of the Sierra Buttes, high up to the Bluffs, is the

PHŒNIX MINE.

This company has a small prospecting mill erected below, on the river, and finished one run of fifty tons, which yielded $2,500. The company will make another run before winter sets in, and during the winter will only work their mine. The mill is rented to the Kentucky Company, which will commence crushing as soon as the Phœnix Company finishes their clean up.

THE KENTUCKY MINE

is situated on the same side of the Sierra Buttes; it runs below the Phœnix from east to west, and was worked already ten years ago, paying at that time well by grinding quartz in an arastra. Since that time the mine was not worked for some time, but the owners then made a contract with Mr. Bisbop to open the mine, and to crush ore for one-half of the gross proceeds. Mr. B. started a tunnel and found the ledge 70 feet deep under the surface. The quartz shows some free gold, although the part of the ledge where the tunnel strikes the same is about 25 feet off from the chimney of pay ore, on which the former party were taking out rich pay. The quartz will pay about $8 per ton, but as soon as the chimney is reached the company can expect pay ore of $50 per ton. The ore will be worked at the Phœnix Company's mill, to which a wagon road is just finished. The Kentucky ledge will either cross or connect with the Sierra Buttes ledges above Sierra City.

Here is a great and promising field for prospectors, which is already opened, as here are two mills, the Phœnix and the Chips mill, both not far from town, and there appear to be a large number of other rich ledges. As soon as the wagon road to Milton's is completed, this part of Sierra City will be easy accessible.

The next mine to the Kentucky is the

SIERRA BUTTES ENTERPRISE,

supposed to be the extension of the famous Rose ledge (one of the three ledges on which the Sierra Buttes Company is working.) The owner of this new claim is Mr. Kane. He started a tunnel about 80 feet below an incline on which he worked before. This work had to be stopped on account of water. The tunnel will tap the ledge a little above Biglow's place. If Mr. Kane could prove that his ledge is the extension of the famous Rose ledge, he would have an undoubtedly valuable property.

On the other side of the ridge, and on the extension of the Sierra Buttes Company's ledges, is situated

THE INDEPENDENT MINE.

The heavy snow slide of last winter forced this company to build a new mill, although their old mill is still running. The last clean up some days ago was over $18,000. The new mill is expected to be finished before the heavy winter sets in.

THE KEYSTONE MINE AND MILL

will soon be in full blast again, and fully recovered from the heavy snow slide of last winter.

THE PRIMROSE MINE AND MILL

are situated in Hog Cañon, above Ladies' Cañon, probably on the extension of the Sierra Buttes ledge, and is now worked again with energy. Mr. P. A. Lamping, the owner, erected a sawmill, and is building a new quartz mill of 20 stamps, and is opening the mine by a shaft on the Good Hope ground 168 feet perpendicular, and dropping from the bottom 480 feet, of which about 120 feet have to be finished to reach the old Primrose ground. This will give stopes of 126 feet, and bring the works again into the formerly rich Primrose ground.

THE SURFACE MINES

in Ladies' Cañon are still paying rich. More extensive river mining on the Yuba river is commenced by building dams and working by water wheels. It is tedious and slow work for miners accustomed to easier and better times, but the work is paying. Companies of white men employ a good many Chinamen.

DOWNIEVILLE.

Quite an excitement in town has attended the final success of the Gold Bluff Mining Company. This company have worked their mine since many a year, but after the ground was worked out they concluded to open their mine again by a lower tunnel. This tunnel was commenced three years ago. The company run a drift from their tunnel, and from this drift a shaft was raised and finally the ledge was struck a few days ago. The ledge dips at an angle of 35 degrees and shows very rich rock. This strike is of the greatest importance for Downieville and vicinity, as it is now proved to evidence that the belt of veins passing above and below Downieville contains true fissure veins. Some, and in fact all mines round here stopped work partly last year, and partly this year, to see the end of the Gold Bluff's Company's work, as everyone round here was convinced that by this deep tunnel of the Gold Bluff Company's mine, the question of continuancy of the mines in close vicinity of town would be settled. This is done by the energy of John Stumpf and his partners, all working men. The proof once more is given that success in quartz mining is dependent upon energy and perseverance. A former company on the same property broke up. Many other companies round here, not finding at the start rich pay, gave up their work and were waiting for these industrious and energetic Gold Bluff men. New life came into this community, and undoubtedly this fall work on many of the surrounding claims will be taken up again. The Gold Bluff Co. will raise their shaft where they struck the ledge by running an incline upwards on the foot wall of their ledge to have air for the lower works. They will establish two levels to work on, and will repair their flume and mill, to start the same again by the first of December, and crush rich ore for years to come. This success of the Gold Bluff Co. has already started the Good Hope Company again, which commenced about two years ago to work a quartz ledge a little nearer to town than the Gold Bluff, and running parallel with this ledge. The Good Hope Company found rich pay on the surface, and is now going to finish the lower tunnel. The Wheeler Company will commence work again, and the Oro mine will be worked by some enterprising men from Indian Valley.

F. B. S.

Sierra City, Oct. 15th, 1868.

Chinese Laborers in the Southern States.—All objections have been withdrawn to the introduction of Chinese laborers into the Southern States. A New Orleans paper says: No further interference of that character can occur without a violation of the stipulations of the Burlingame treaty, which provide for the free emigration and immigration of the people of both nations, placing the Chinese Empire in the same relation to the United States that the European States maintain.

Mechanical.

THE BEST MATERIAL FOR SHAFT-ROPES. The *Colliery Guardian* gives some articles by M. Deroux upon "the winning and working of coal,"—translated from *La Houille*,—from which we take the following upon shaft-ropes: "It is extremely difficult to resolve the problem whether preference is to be accorded to cables of hemp, of aloes, or of wire. Each of these has its patrons and its detractors, and no absolute conclusions have been yet arrived at. The sudden snapping to which wire ropes are liable, has caused them to lose ground in the confidence of engineers. For several years the problem has seemed on the point of being resolved by the employment of steel wire, and especially by the employment of manganese steel wire, the resistance of which, at an equal section, has been found much superior to that of the iron wire. But cables of steel wire are subject to rapid changes; they grow brittle. People accordingly continue the use of hempen ropes, and more especially of "aloe" ropes, which are lighter and offer greater resistance for a given section. The property enjoyed by the aloe thread, of not growing rotten, renders it valuable for employment in pits generally moist, and particularly in those which do not permit the return of the air of the inner workings. M. De Mot, one of our principal manufacturers, says that "under favorable conditions a cable of aloes, lifting a weight of from 3,200 to 3,400 kilos. from a depth of from 400 to 500 metres, and of a mean weight of 7¾ kilos. to the current metre, may extract from 130,000 to 140,000 tons."

LARGE PUMPS.—The *Colliery Guardian* notices some centrifugal pumps just completed at the Hammersmith Iron Works, which are the largest ever made. Each is intended to lift 250 tons, or upwards of 50,000 gallons of water per minute, to the hight of six feet. The revolving disk, or "fan," is 4 feet 6 inches in diameter, and its width at the periphery 8¼ inches. The suction and delivery pipes are 3 feet 6 inches in diameter. The whole hight of each pump is 11 feet 6 inches, and its length 9 feet, while the extreme width, in the direction of the main spindle, is 8 feet 9 inches. The spindles are of Bessemer steel, 6 inches in diameter through the disk. The weight of the disk is 18 cwt., of the spindle 16 cwt., and of each side casing 2 tons 13 cwt., the whole weight of each pump being 7 tons.

ADHESION OF METALS TO METALS.—If two pieces of metal are scraped very clean,—says Prof. Robinson,—a smart blow will make them cohere so as to be inseparable. Gold and silver are thus fixed upon steel surfaces. The steel is scraped clean, a thin piece of the gold laid upon it, the die applied, and a blow with a hammer given. The two metals will not so adhere if polished. Perhaps some of the greasy matter generally used in polishing, remains. Moreover, the scratches and ridges, made by the scraping, allow the air to escape as the pieces come together. In coining, the piece would adhere fast to the die, but for the fact that the hollow which is to form the relief of the coin, is filled with air which is confined by the engagement of the flat face of the die with the coin, and serves as a cushion. In a certain case, the die happened to crack in the highest part of the relief. From that time it was useless, and had to be thrown aside; for it was found almost impossible to separate the coin from it.

CEMENT FOR STEAM PIPES.—The following directions are given for making a cement impermeable by air and steam, which is said to be superior to any in use for steam and gas pipes: Six parts of finely powdered graphite, three parts of slaked lime, and eight parts of sulphate, are mixed with seven parts of boiled oil. The mass must be well kneaded until the mixture is perfect.

TENSILE STRENGTH OF CAST AND WROUGHT IRON.—The extension or elongation of a wrought-iron bar is in proportion to the weight or force tending to stretch it. This ratio does not hold in the case of a cast iron bar, which, instead of being elongated the 1-10000th part of its length for every ton of strain per square inch, is stretched to double this amount, or the 1-5000th part, and moreover does not obey the law as the magnitude of the strain is increased. Judging from the different internal structure of the two materials, one is at first inclined to consider the elongation of cast iron as somewhat paradoxical—to be surprised that it should be double that of wrought iron for the same strain and sectional area. A little reflection will point out that this proceeds from confounding the immediate effect of the strain upon the iron with that which it produces when the breaking weight is reached. Thus, although cast iron extends twice the amount of wrought with a given strain, yet its ultimate tensile strength is barely a third of that of the latter material. Briefly, cast cast iron may be said to extend too quickly—too much at a time, and consequently its ultimate powers of tensile resistance are very soon arrived at. Wrought iron, on the contrary, is not affected so rapidly or to the same extent, and is enabled to bear in consequence a greater strain before its resisting capabilities are overcome.—*Engineer.*

PLIABLE STEEL.—At the Quarterly Meeting of Ironmasters at Norwich, in September,—says the *London Mining Journal*,—samples of steel were shown by Messrs. Fox, Head & Co., from ingots cast by Samuelson & Co., and the wonderful pliability of the metal, two-thirds made of Cleveland iron, created considerable astonishment. It was worked in three different processes, known as the A, B and C. In process "A" the strain was, with the grain 58.6 tons per square inch, across the grain 52 tons; "B," with the grain 50.6 tons, across the grain 48 tons; "C," with the grain 56.3 tons, across the grain 56.3 tons. During experiments with the three processes it was shown that the steel, while cold, would bend double without the slightest flaw, and this either with or across the grain. The heated metal would also bend across the grain, and then, after being doubled, would bend back with the grain; while the plates were afterwards punched, in order to test if the fabric had been in any way injured by heating, and were found thoroughly sound and pliable.

FOREST LEAVES FOR TANNING PURPOSES. At a recent meeting of the Farmers' Club of the American Institute, Mr. Orville M. Tinkham exhibited specimens of leather tanned with an extract obtained from forest leaves, and claimed that not only could a valuable tanning material be obtained from leaves, but that the value of the leaves for manuring purposes would not be impaired by the steeping process involved therein. Mr. James A. Whitney was appointed to make chemical analyses of different varieties of leaves and report on the probable value of the above-named discovery.

USEFUL ALLOYS.—A German chemist has analyzed several alloys which are used in Paris for the manufacture of table ware. The first, a beautifully yellow alloy, is really aluminum bronze, and is composed of 89.3 parts of copper and 10.5 parts of aluminum. The second, "oreide," is composed of 79.7 parts of copper, 13.05 parts of zinc, 6.09 parts of nickel, with 0.28 parts of iron, and 0.09 parts of tin. The two last named are no doubt accidental ingredients. The third is a beautiful white metal, very hard, and taking a beautiful polish. It is composed of 69.8 parts of copper, 19.8 parts nickel, 5.5 of zinc and 4.7 of cadmium.

BRASS.—The following is from Prof. Dussauce on "Alloys" in the *American Artisan:* Ordinary brass must contain 67 of copper and 33 of zinc. Often it contains two to three per cent. less of copper, which is substituted by lead and tin.

Brass employed to make threads must be tenacious, and is composed of 64 to 65 of copper, 33 to 34 of zinc, 0.8 of tin and lead.

Brass to be worked with hammer contains 70 of copper and 30 of zinc. For naval constructions brass is much richer in copper; some specimens contain 76 of copper and 24 of zinc; others are composed of 85 of copper, 14 of zinc, and 1 of lead.

Scientific Miscellany.

The Mound-Builders of Tennesse.

The *Nashville Press* of Oct. 22d, has an account of a lecture delivered in that city by Dr. Joseph Jones, who has been occupied during the past year in the exploration of the mounds of Tennessee. In the center of a pyramidal structure of earth, he found what appeared to be the remains of a chief, surrounded by other human skeletons. Ashes, bits of pottery, and bones, indiscriminately mixed, were found in another part of the same mound. Vases and shell ornaments were also found. Two large stone idols were shown, carved out of a dark iron-colored rock, the largest some thirteen inches in hight, and the other, perhaps, four inches less. One represented a female, and had the hair gathered up behind in a diminutive waterfall, while in the longer specimen, that of a male, the hair was represented twisted in a queue.

Two copper crosses were exhibited, together with three vases, the outsides of which were divided into three regular compartments, having three crosses and three crowns, a vase resembling a child's foot, with the opening at the heel, and another surmounted with a carved head and hemlet, were shown. In a mound near Franklin was found the skeleton of a child, the face of which was covered with a shell ornamented with "hieroglyphics," among which the triangle often occurred. An idol, exhumed from the mouth of Lick Branch, Nashville, was also displayed, and a small female effigy in white clay, with the marks of the cross upon the shoulders.

The Doctor exhibited a great number of implements of warfare, such as stone axes, arrow-heads, knives, spears, etc. Also, culinary utensils, mortars used for grinding Indian corn, and paint. He thinks that the builders of these mounds probably belonged to the great Natchez tribe, which, coming from the south, spread itself through the valley of the Mississippi and its branches.

ARTIFICIAL RUBIES.—The white basis for artificial gems is made by mixing quartz 45.7 parts, carbonate of soda 22.8, calcined borax 7.6, salpeter 3.4, and red lead 11.8—by weight—and heating to redness in a charcoal fire. In England mineral coal is often used instead; and owing to the sulphur therein contained, the product is inferior to that obtained upon the continent. According to M. Douault, a magnificent artificial ruby can be obtained in the following manner: Of the mixture given above 31 parts by weight are taken, which, finely pulverized, are intimately mixed with glass of antimony 2.30 parts, and purple of Cassius 0.05 parts. On cooling this mixture after being well melted it sometimes gives a transparent mass, and at others an opaque product. When transparent it is a brilliant imitation of the topaz; when opaque it forms a splendid imitation ruby by melting 2 parts of it with 8 parts of the primary mixture. The product, when taken from the crucible, is in the form of a brilliant yellow crystal, but before the blow-pipe it is transformed into a vivid red crystal, having exactly the tint of the Oriental ruby.

THE MUSCLES OF INFUSORIA.—Stein, in the recently published second part of his work upon infusoria, modifies the opinion expressed in the first part,—that these organisms had no muscles;—saying that the works of Kuhne have now proved that an independent irritability exists in the muscles, and that their contractile power does not depend upon the action of nerves. Kuhne has shown that an extremely dilute mineral acid, too weak to act upon the intermuscular nerves, will produce strong convulsive movements of the muscles. Ammonia, which does not act upon nerves, will produce the same effect, convulsing the muscles by its fumes even at some distance.

PREPARATION OF CARBON TUBES.—G. Gore thus prepares small tubes, rods, crucibles, etc., of carbon. Articles of the desired shapes, but of sufficient size to allow for shrinkage, are formed of different kinds of wood. These are allowed to dry in a warm place, with occasional turning. They are then enclosed in a copper tube retort provided with two exit tubes for the escape of gas; the tube placed horizontally between fire-bricks and heated,—with extreme slowness at first, finally to bright redness,—by means of a row of Bunsen's burners. It is necessary continually to turn the retort, and so to distribute the heat during the burning process that none of the evolved tarry matter shall be condensed upon the articles;—otherwise their form is distorted. The heat is continued until gas ceases to be evolved. The materials used are the harder woods, as lignum vitæ, boxwood, ebony, etc. The first named is by far the best.

A HINT TO ENTOMOLOGISTS.—The difficulty of securing specimens of butterflies without injury, makes the following worth notice. T. W. Wood, F.Z.S., sends to the *Intellectual Observer* for September, a description of his method of catching the delicate little orange-tip, *(Anthocaris Cardamines)* which sleeps upon the blossom of the wild parsley. A small box (pill-box) is opened and closed very gently upon insect and flower together; the stem is severed outside the box, which is then placed in the pocket. If this is carefully managed the insect will not have moved. The box may be placed under a tumbler with a few drops of prussic acid upon blotting-paper. In a few minutes the butterfly will be dead and stiff. The next day it will relax,—and will then be ready for setting. By this plan, all *fluttering*, which so greatly defaces the beautiful wings, by rubbing off the down, is avoided; no legs are broken off, and no crushing of the insect to destroy its symmetry of form, is risked.

LIGHTNING.—Marshal Vaillant, in a paper read before the French Academy of Sciences upon this subject, after remarking that discharges of atmospheric electricity may take place in three ways, either from a cloud to the earth, or from the earth to the former, or from one cloud to another, says that thunder can rarely be heard except in the two former cases, it being generally much too distant in the latter to catch the ear. He considers what is called "summer lightning" to be not a mere consequence of heat, but the discharge of electricity from very small clouds, which their distance renders invisible to us, though we perceive the sheet of electricity they exchange between each other. Marshal Vaillant is further confirmed in this opinion by the fact that, very soon after "summer lightning" has been observed after a very hot day, large clouds generally appear in the sky with great suddenness.

ANTI-GLACIAL THEORY.—Alfred Tylor, F.L.S. F.G.S., read a paper "on the Quaternary Gravels of England" at a recent meeting of the Geological Society, in which he took the ground that the gravel beds in the valleys of the Aire, Taff, and Rhonda, are due not to moraines produced by the melting of ice, but to a long period of excessive rainfall, which he terms the "Pluvial period." He thinks the ice-action, of which there is evidence, was subordinate to the aqueous action; and that the immediate source of the gravels was the high land adjoining the rivers. Mr. Tylor's view was combatted by several speakers; among whom were Sir Chas. Lyell, Prof. Ansted, Boyd Dawkins, and others.

A MARSUPIAL FISH.—At a meeting of the Farmers' Club of the American Institute, on Oct. 6th, Dr. Feuchtwanger read a brief paper concerning a marsupial fish stated to have been recently caught on the coast of New Zealand, and which has been termed the kangaroo fish from its resemblance in some respects to that animal. The specimen caught measured five feet in length when stuffed, and is described as having a long cartilaginous snout, fine at each side, and legs like those of the jumping quadruped above mentioned.

Washoe Ores, Reduction Mills and Machinery.

Almarin B. Paul, an experienced and well-known quartz operator in Nevada, after giving an interesting review of the mining history of Virginia City and vicinity, in the *Evening Bulletin*, closes with the following:

As will be observed by the foregoing tests, the surface ore of Gold Hill commenced with two-thirds gold and one-third silver; this gradually changed in depth, and my last working on these ores ran down to one-third gold in value to two-thirds silver.

A BIT OF THEORY.

This creates a query, as yet never satisfactorily answered to my mind, and will no doubt have to be propounded many times before we can arrive at a solution that cannot be overthrown. It is presumed and generally acceded to, although some very prominent geologists think not, that these bodies of mineral are ejected from below. But if so, how is it that the surface always carries a higher percentage of gold, and which loses itself as you descend in depth? Are we sure that gold, through the action of the sun's heat in connection with atmospheric action and the other metals, is not the product of silver as a base? As we are all at sea in reference to the formation of gold and silver, we can only suggest theories, noting Dr. Lanszweert, Daintree, and others' views.

A WORD ABOUT THE HOWLAND ROTARY BATTERY.

I will now ask the attention of the reader, if engaged in mining, to a few observations respecting the Howland Rotary Battery, as no act of mine in mining has been more criticized than the adopting of these batteries in my Washoe operations. Their adoption was no blind work, as I had used them for three successive years previous, and in no test with other mills was I beat in returns. I had then and have now great faith in their principle. It certainly is in the right direction. They will in time, I am confident, become popular, especially when introduced with the later improvements, on account of their simplicity, efficient working and cheapness.

SOME SUGGESTIVE FACTS.

They have now been running in the Gold Hill mill of the Imperial Silver Mining Company, for over seven years. As this will be admitted by all to be a good test, we will see how it figures up in the later years as to yield per ton and wear and tear. To get at it we will take the official reports of the company for 1865, 1866, 1867, 1868. It must be understood that the Imperial Company have two mills, one of forty stamps, (rotary) at Gold Hill, run by steam power, and one of eighty stamps (straight batteries) at Dayton, run by water power. The tests I bring up are on ore from the same mine—"Alta"—of which these mills have worked thousands of tons within the time named:

1865—Gold Hill Mill, yield per ton	$30 23
1865—Rock Point Mill, " "	28 75
1866—Gold Hill Mill, " "	31 02
1866—Rock Point Mill, " "	29 72
1867—Gold Hill Mill, " "	29 31
1867—Rock Point Mill, " "	27 98
1868—Gold Hill Mill, " "	20 29
1868—Rock Point Mill, " "	22 22

By this, it will be seen that, with the exceptions of the last year, the Gold Hill mill had yielded a larger percentage per ton than the Rock Point with all its modern improved amalgamating appliances, the former having the Knox pan, which was first introduced when I built the mill.

So much for the yield per ton; now for the wear and tear. The amount of ore worked during the foregoing year, was: Rock Point mill, 95,312 tons; Gold Hill, 43,279 tons. The receipts for old iron during the same period, was: Rock Point mill, $16,338.53; Gold Hill, $4,817.81. This gives the wear and tear per ton of Rock Point mill, 17 cents, and a fraction over, per ton; Gold Hill, 11 cents, and a fraction over, per ton; fractions being about equal.

These are undeniable facts, and will no doubt set quartz men, who are not governed by prejudice, to thinking, as the saving of money in the first investment, and being daily benefited in yield and wear and tear, is an item they generally are ready to consider and accept.

IRON AND WOODEN BATTERIES.

Somehow in California there seems to be an opinion that batteries constructed entirely of iron will not do, while in Europe and America they are superseding the wooden ones. The only trouble in the past with us has been that all iron batteries were too lightly constructed, which proved misplaced economy. In localities where timber is poor or scarce, they certainly are cheaper and more durable. I might here add that my expenses of working ores at Gold Hill mill, from 1st of January, 1862, to 1st July of same year, (being six months,) was $1.52 per ton. This is the only working statistics I can now find among my papers.

THE KNOX PAN.

As I have before observed, the pans for amalgamating introduced into these mills were those known as the Knox Pan. These were originally got up for gold ores, and this was their first introduction into silver mining, and we may say the beginning of the iron pan process of working silver ores, unless we except the Hungarian bowl, or the two foot Bartola pan as the original pan. The Knox pan is four feet in diameter, with iron mullers and copper plated cross-boards, and is in an entirely new direction to either of the above. These pans working so well, there was a general desire to improve on them, which has culminated in more than a dozen different kinds, all of which are about the same thing, varying, however, in size, speed and power. For *amalgamating slowly* I think Knox's is preferable to all others. Waklie made his five-feet diameter, which gained some celebrity through the Smith and Dewey process. These pans were set on brick furnaces and heated by wood. Howland conceived the idea of a stove, as cheaper and better (for the foundry). They were made of iron, and beneath the pan was a circular flue, in which the heat and smoke circulated.

IMPROVEMENTS.

About this time Waklie, I believe it was, took up the idea of using steam directly in the pan (at Mexican Mill, Virginia, Nev.) Howland caught at this idea and put steam instead of smoke into the iron chambers below the pan. About the same time Mr. Palmer, of Palmer, Knox & Co., brought out the false bottom with steam chambers; and these are the steps, in order, which have culminated in the Washoe Pan process, and the introduction of the Varney and Wheeler & Randal pans, which have attained a great popularity from their pulverizing as well as amalgamating qualities.

THE GERMAN PLAN PREFERABLE.

Although the first, as I claim to be, to launch out on this new line of working silver ores, I nevertheless think it would have been better for Washoe had the German mode been adopted. It would have been going slower, to be sure (which does not suit our active American blood), but that is what we have got to learn in mining land with it—not to expect too much in a short time. We would have been going slower, as I before observed, but we would have had 30 per cent. more bullion out for circulation, or the Comstock lode many thousands of tons unextracted.

A FINAL SUGGESTION.

I don't think it would hurt any of us young American miners either if we would set aside a little of our conceit, and study European and even Mexican modes more than we do, especially the former. We act, talk, write and think too much as though there never was any mining done until California was discovered and Americans went to mining. I don't think it would hurt the shareholders of the Comstock to reflect on their losses, as on an average 40 per cent. of the Comstock metal is going into the Carson river. The general idea is that a School of Mines is going to remedy all these evils. It may in years to come, but there are any number of practical and scientific miners in California obtainable at fair salaries, who know more of metallurgy and mining than a School of Mines can teach new pupils in a quarter of a century. Why not commence now if we want to remedy evils by science? I do not wish to be understood as being opposed to a School of Mines—that would be absurd.

As Prof. Phillips has well observed: Practice is as essential as science.

CREATION OF MAN IN HAWAII.—The god Kane drew his image on the sand, and called it to life by the prayer oft repeated: "*E hiki au e ola*"—"Live through my power." It became a man named *Hulihonua*, or "turning earthward," as did the god when drawing the figure. The man lived, and, being tired of his lonely life, besought the god for a companion. The light from the heavens, *lani*, cast his shadow on the sand. It became a woman, and she was named *Keakahulilani*—"Shadow looking heavenward" (for its source). These were the aborigines of Oahu, their names as above being found in an old *mele* of the Oahu chiefs.

(Written for the Mining and Scientific Press.

An Opportunity for the Erection of Iron Works.

In the development of the unmatched resources of California, one of our faults has been to neglect what may be called the sinews of our strength and wealth, for objects which glittered. Agriculture generally was deserted in early days for gold digging, and now, iron, tin, granite and marble are neglected for gold and silver. This is wrong. We should not give any one or two interests a monopoly of our attention and capital. In diversity of industry lies the greatest wealth and the greatest safety and strength. This, the history of the richest countries of the world has abundantly shown.

The fame of the wealth of the Sierra Nevada range in gold and silver deposits is world-wide; but little comparatively is known, because but little has been done to show how rich they are in iron, marble, granite, lime, copper, tin, and many other valuable deposits. The first named—iron—is the most requisite metal to commerce. We use vast quantities of it, and enrich those who produce it abroad, and those who carry it to us from thence, every year. This we need not do. Large deposits of iron ore are found in many places in the Sierras, notably at a point distant seven miles from Tinker's Station, on the Pacific Railroad line, above Cisco. This ore is of the very best possible kind, and without selection or picking, yields, when smelted, 80 per cent. of pure iron, of a quality which is suitable for steel making purposes. The locality is thickly covered with timber, and a really first class road connects it with the railroad line. A trip to this place would not cost over $50, and is one of the pleasantest possible. The development of this iron would hardly fail to be very profitable to our manufacturing interests, and we think it would be wise for some of those interested to visit the place and see for themselves the advantages that are offered. No speculators have possession of these iron beds; they are open to the first parties who come along to work them in good faith. The Pacific Railroad Company offers every inducement to those who set about developing any of the rich resources along the line of its road. Only half the usual charges are levied upon the native products. The State of Nevada is a large consumer of iron, and the deposits named are about 250 miles nearer to it than this city is, whence our sister State receives her iron supplies. The difference in freight charges would therefore constitute a handsome premium to the iron of the new district. Will some of our iron merchants or foundrymen look into this matter? There is both profit to the individuals and the State in it.

T. M. G.

San Francisco, Nov. 16th, 1868.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

KERN RIVER IRRIGATION CO.—Kern Co. Nov. 7th. Capital stock, $50,000. Trustees: W. C. Ralston, Alvinza Hayward and E. V. Joice.

CALIFORNIA TYPE FOUNDRY CO.—San Francisco. Nov. 9th. Capital stock $100,000; 1,000 shares, $100 each. Trustees: Wm. Faulkner, G. L. Faulkner and F. W. Faulkner,

DRUIDS HALL SOCIETY.—San Francisco. Nov. 11th. Capital stock, $50,000; 5,000 shares, $10 each. Trustees: J. L. E. Schuetzen, H. J. Hartnagle, Conrad Berghofer, Julius George, Fred. G. E. Tittel, John Staude, John Otto, Charles Kittelberger, Adolph Falk, Geo. Hobe, J. W. Andrzeiowsky, Theodore Hartung, Joseph Lingenfelser, J. Vanderleith, Jacob Vogelsdorff and Julius Wildermuth.

ELECTION OF OFFICERS—EMPIRE MINING CO.—Nov. 2d. Trustees, Delos Lake, John O. Earl; President, Delos Lake; Secretary, T. W. Colburn.

RISING STAR S. M. CO.—Idaho Territory, Nov. 2d. Trustees, Geo. D. Roberts, J. W. Gashwiler and J. C. Flood; George D. Roberts was also chosen President.

PILE driving over the main channel of the Yuba is progressing finely.

IRON ore mining is flourishing in Western Massachusetts.

FARMERS in Montana are trying to domesticate the buffalo.

THE farmers at Tampa and Clear Water Harbor, Florida, have engaged their crop of oranges at $20 per thousand.

IN the Platte Valley the wheat crop will yield forty bushels per acre, in a large portion of the valley; oats fifty to eighty bushels.

BALLOON ascents have shown that over England the cloud region has a thickness varying from 1,500 to 3,000 feet, and that the temperature at the top is not lower than at the bottom.

THE Egyptian Government has appointed the English traveler, Mr. S. Baker, to direct an expedition toward the sources of the Nile, with a view of establishing commercial relations with the natives.

COBALT IN TASMANIA.—The Hobart Town *Mercury* of the 17th inst., says: "Some time ago a lode was discovered on the river Don, in the Devon district, yielding cobalt, silver, copper, and antimony.

A SECTION of the Perry block pavement was laid at the corner of Montgomery and Jackson streets last Saturday. The advantage claimed for it is a kind of fossilization process, rendering wood indestructible by moisture, age or the *toredo*,

A SCIENTIFIC KING.—The King of Siam is an able astronomer, and possesses a collection of instruments that would excite the envy of any European savant. He edits the Bangkok Almanac and makes frequent and long excursions in order to study the starry firmament.

COLONIAL TIMBER.—The Hobart Town *Mercury* reports that a Huon-pine waterwheel, which has been at work for nearly fifty years, underwent examination, and was found to be almost as sound as on the day of its erection. This fact speaks well for the durability of our colonial-grown timber.

PRACTICAL ASTRONOMY.—A French astronomer, Lieutenant Fleuriais, has been sent to Honolulu by his Government to ascertain more accurately the longitude of that port, as a basis for future astronomical and geographical research. Occultation of the various stars will furnish him with data.

EXPLORATION OF THE HIMALAYA.—Prof. Robert Von Schlagintweit, of the University of Giessen, one of the celebrated explorers of India, especially of the Himalaya region, is soon to arrive in this country, under an engagement to deliver a series of lectures at the Lowell Institute of Boston, on "The Results of a Scientific Mission to India and Upper Asia."

A POPULAR German geologist and liberal politician—Prof. Karl Vogt—has been engaged by a New York manager to lecture in the United States. Vogt is not only a learned naturalist, but famous as the leader of the liberal school. He was one of the celebrities of the Left in the Frankfort Parliament, and when that body, in June, 1849, went from Frankfort to Stuttgart, he was elected one of the five regents of the empire. He is an eloquent speaker.

THE CATHOLIC RELIGION IN CHINA.—The Catholics are erecting a $3,000,000 cathedral in Canton, China, and another, quite as magnificent and costly, is to be put up in Pekin, while in nearly every important city of the empire they are building a church. The Jesuits throughout the empire have adopted the dress, habits and customs of the Chinese—eating as they eat, sleeping as they sleep, shaving the forehead and not the crown, just as the Chinese shave theirs.

THE orange louse or aphis is destroying the orchards at Kona. From one orchard of three hundred trees there is a prospect of but 2,000 oranges, less than the fair yield of a single tree, and the largest orchard in the country is about to be turned into a cane-field. The blight, which has appeared and receded so capriciously for many years, seems now to have settled down beyond any reasonable hope of relief. Under these circumstances, it is unlikely that any further attempt at fruit culture will be made in this beautiful district, though coffee culture is being slowly extended, the percentage of loss by blight leaving a margin of profit.

PICNICS.—All in search of health, pleasure or recreation, will find Woodward's Gardens one of the most desirable places of resort this side the garden of Eden. *

IT may be singular, perhaps not, that no one who has purchased spectacles of C. Muller, 205 Montgomery street, is ever dissatisfied with his bargain. *

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, November 14, 1868.

Financial.

Our local money market is undergoing a slight pressure of the screw, but is very far from experiencing the throes which are reported to be convulsing the Eastern markets. An inclination to hold balances is apparent among the banks and savings and loan institutions, and although the deposits in these last are about equal to the withdrawals, the demand for money is so great as to exceed the means of supply. Some have ceased for the present to receive applications for loans upon mortgage, and flat loans are wholly ignored. The only ones effected are made re payable in monthly instalments at rates rather higher than below 12 per cent. per annum. Offerings upon collateral security are large. First-class business paper, with double endorsements, is done at 1¼ per cent. per month; acceptable paper rules at 1½ per cent. monthly. While it is admitted that there is a scarcity of money at present, yet we are wholly free from the financial agitation experienced in New York, because the nature of our currency will not permit the discreditable transactions systematically effected in that city. Whenever stringency occurs here, it is real, arising from the scarcity of coin, and the scarcity, just now, is due to the more extensive employment of money all over the State. It is possible that hereafter the Secretary of the Treasury may be enabled to repress the tendency to speculate in gold and legal tenders. He has announced, that he possesses the power to re-issue any legal tender notes that have been redeemed, but not canceled, to the amount of $400,000,000. Of this sum $356,000,000 have never been redeemed, and are now in circulation, while $44,000,000 have been retired but not canceled; and it is this latter sum the Secretary holds ready to re-issue. Should he do so, it will preclude the necessity of selling Government gold to that amount, and will seriously interfere with the schemes of unscrupulous speculators who make it a point to obtain and lock up, out of the market, from ten to twelve millions of currency about the time of the banks' quarterly statements, thereby causing a severe pressure for the time being. The fact that the Secretary can come to the relief of the business community will have the effect to repress such speculations.

A great deal of our coin has been paid over to farmers while their products are lying unsold in our warehouses, which at present hold considerably more grain than ever before. So soon as this shall have been disposed of, our stringency will be at an end. Gold bars are in good supply, having come to the relief of the silver market, the bars of which are scarce and in demand. We quote gold bars from 830@830, as the extremes, the bulk of the business being confined within those margins. Silver bars rule from par to ¼ per cent. premium. Currency bills on Atlantic cities sell at 83 per cent. premium on gold; sight drafts, payable in coin, are negotiated at 1 per cent. premium; telegraphic transfers are made at 1¼ per cent. premium; sterling exchange is at 48¾@49d; commercial do, 49⅛@49¼d; Mexican dollars are quotable at 4@6 per cent. premium. Gold in New York, on the 12th instant, was selling for 133½. With us Legal Tenders rule at 73½@74.

City Stocks.

Dullness pervaded the market for miscellaneous securities during the period under review. The sales in the Board have been—100 shares San Francisco Gas stock at $72 per share; 3 shares State Telegraph stock at $20. At the close California Steam Navigation stock declined to 65 per cent; Spring Valley Water realized $65, and San Francisco Gas sold at $73.

The Merchants' Mutual Marine Insurance Company paid its annual monthly dividend of 1 per cent. on the 10th instant. The Bank of California will pay its usual dividend of 1 per cent. per month on the 16th instant. The California State Telegraph Co. announces its usual dividend, payable on the 16th inst.

Mining Share Market.

The list of mining stocks usually dealt in experienced a very marked decline during the past week, as will be more fully noticed in the remarks upon the various stocks herewith given. This depression culminated on the 11th instant, since which time some stocks have improved; however, the market is not characterized by any great degree of vitality, and sales have been comparatively light, having in the aggregate fallen considerably below the transactions when the daily open session was held.

Concerning the Comstock lode, a correspondent of the *Alta* writes as follows: "I suppose that it is no longer a secret that no considerable quantity of paying ore was discovered in this level [900, Crown Point]. There is abundance of quartz which works very easily, and the ledge is as clearly defined as at any point above, but the pay streak appears to have "jumped over," and must be sought beyond the clay wall, or still further below. There appears to be no fear that the bottom of the *bonanza* has been reached, but certain it is that this 900-foot level is a barren one. Those who argue that the Comstock lode must be tapped at great depth to relieve the mines from water are surprised and to some extent confounded by the discovery that at this depth no water is found. The water ceases to trouble the miners before this level is reached, and very little pumping is required. In the Yellow Jacket the pumps now run only about half the time. As the drifting on this level approaches the Kentuck ground, traces of pay ore are discoverable, and Mr. Jones [the Superintendent], appears confident that the latter Company will develop a great body of it. The drift is within twenty feet of the Kentuck line, and it is his intention to run on into their ground and prospect it well on this level. Ascending a ladder for fifty feet, we come to a fine body of rich ore in the Crown Point ground, midway between the 900- and 800-foot levels. This has been followed for 175 feet, and the end is not yet. There is enough rich ore in this body now in sight to last for some months at least. Descending again to the 900 foot level, we entered the cage and went up to the 800-foot level; then passed through the Kentuck ground, rambled around the various chambers, inspected the great bodies of ore in that mine, and finally came out into the Yellow Jacket, and returned to the surface of the earth through the hoisting works of that Company. The Kentuck has ore enough in sight to enable them to pay dividends for the next eight months—so old miners tell me, and so Mr. Jones thinks; he ought to know—and the Company is working very successfully, perhaps more so than any other on the ledge. It is a noticeable fact that all the ore in the ground south of the Yellow Jacket pitches towards the ground of that Company, and this, with the recent developments there, leads people in Virginia and Gold Hill to entertain great confidence in the future success of that mine, a confidence which is strengthened by the $300 dividend just declared."

Imperial.—declined from $97 to $83, rallied to $91, and closed at $88. On the 11th instant, $7,991 in bullion was dispatched to the office in this city. The shaft had attained a depth of 142 feet below the 900 level on the 9th instant, and at that date the rock was soft in the north end, while about three-fourths of it continued in hard rock. In the drift near the north line, running west, on the 900 level, they passed through the top part of a body of quartz containing a large quantity of lead and iron, but no silver, and as this base ore does not extend above two feet in height in the drift, they cannot prospect it below the bottom of the drift until the ledge is opened and the water drawn off. It is believed that by sinking in this base material a body of pay ore will be encountered.

Savage—declined materially since our last review, selling as low as $56, rallying to $63, and closing at $61 75. The bullion returns for the month of October foot up $128,000, against $140,000 in September. This company passed their dividend for the present month.

Crown Point—sold to a larger extent than the previous week, declining from $42 50 to $32 50, improving to $39, and closing at $37. Letters to the 10th instant state that enough work has been done on the 850 level to demonstrate that the body of ore will average from four to eight feet in width, and that it will extend south at least 160 feet and up to the 800 level track floor, showing a value of $28 to $40 to the ton. The rock in the shaft continues hard. A winze was started at a point five feet north of the south winze on the 900 level. The receipts of bullion for the month of October amounted to $45,669 51, and the expenses, including disbursements for supplies, foot up about $65,000. In September the bullion returns aggregated $44,369.

Hale & Norcross—sold within a range of $43 50@36, improved to $52, and closed at $47 60. During the month of October $26,641 26 in bullion was obtained from 1,228 tons of ore.....Kentuck dropped from $220 to $175, rallied to $191, and at the close realized $181.

Chollar-Potosi—receded from $136 to $120, then sold at $127 50, and closed at $126. During the week ending November 6th, 1,086 tons of ore were extracted, against 1,746 tons the previous week. In their new works, the north drift on the 1100 level is in hard rock. On the 6th instant, the whole length from incline was 876 feet, and the depth of incline 418 feet, being 58 feet below the 1200 station. At the present rate of sinking they expect to reach the 1300 level by the 20th of next month. On the 10th instant, $11,718 48 in bullion was forwarded to the office in this city.

Gould & Curry—declined from $85 to $66, improved to $70, and closed at $75. They have concluded to make a station at a depth of 1,056 feet in the new shaft, which will be called the seventh station. The indications at this point at present are more favorable for successful developments than at any portion of the shaft.....Confidence was not in the market during the period under review. Shipment of bullion on the 9th inst., $2,737 75. The annual meeting of this company was held yesterday afternoon. The accounts are made up for the fiscal year closing October 31, 1868, and, through the kindness of the Secretary, we are permitted to give the following statistics:

RECEIPTS.	
From bullion, 4,098 tons, equal to $19 89 per ton	$81,345 75
From ore sold	1,360 76
From assessment No. 6, of $10	15,600 00
From book accounts	11,479 97
From notes discounted	13,753 88
From other sources	7,836 70
	$131,326 01
DISBURSEMENTS.	
For reducing ores	$54,072 00
For mine expenses	36,600 23
On book accounts	19,696 48
Bills payable	15,803 83
Other payments	8,243 37
	$131,326 01

The liabilities are stated at $3,378 09; assets, $1,500—leaving the net liabilities at $1,878 09.

Amador—sold at $215@210. During the week ending Nov. 7th, they extracted 637 tons of quartz, and during the same time the Badger shaft has been increased in depth ninetecu feet, the vein showing the same as heretofore. The north drift on the Sacramento level has been driven about eight feet, and the ledge is said to be increasing in size as they advance.....Opinn was in the market at $20@17 25, closing at $18. On the 4th inst., the shaft was 519 feet in depth. An assessment of $3 per share was levied on the 9th instant. Joseph Marks has been elected Secretary of this company, in place of Robert George, resigned.

The sales in the Board during the past week amounted to $1,381,280.

A distinguished Methodist Minister and prominent Temperance Lecturer once remarked that go where he would, from one end of the country to the other, he hardly ever failed to find Plantation Bitters; and while he condemned the practice of using these Bitters too freely, he could not conscientiously say that he would discard them from the side-board, for he had himself experienced beneficial results from their use, and that, from a long and close observation, he was convinced that when used moderately, and as a medicine exclusively, they were all that was recommended. At the same time he warned his hearers not to pull the cork too often, for they were far too pleasant a tonic to trifle with.

Muzzle-loaders.—All the muzzle-loading arms in use in the English colonial stations are to be recalled for conversion into breech-loaders.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

The Animal Kingdom in Tasmania.—Gerard Krefft, the curator and Secretary of the Australian Museum, Sydney, has prepared a *brochure*, in which all that is indigenous in the animal kingdom of Tasmania is carefully classified and described. In summing up the vertebrata of the island (leaving out the extinct dingo, seals, whales, and marine fish), we find there are 26 mammals, 162 birds, 6 lizards, 3 snakes, 7 frogs, and 4 fresh-water fishes—in all, 208 vertebrata, about 37 of which may be considered as peculiar to Tasmania. The invertebrata have been collected to the number of more than 1,000 species—that is to say, of the class insecta, 950 species, and 98 of the class mollusca; 21 of the latter are land shells, and nearly all peculiar to Tasmania. The insects appear, with few exceptions to be identical with Australian species.

Glass Works in Australia.—A glass manufactory is being established in Melbourne, under the management of Mr. Nixon, a practical glass-worker. The buildings which are to be erected will be of a temporary character, but if the new industry is successful, their place will be taken by a more substantial structure. The appliances at the command of the manufacturer will enable him to melt and convert into glass 350 pounds of "metal," as it is technically termed, thrice a week, but this quantity can if necessary be easily doubled. At first, five hands will be employed.

Inducement to Plant Trees along Country Roads.—If a farmer plants a row of trees along the road in Wisconsin, he is exempted from working on the road. A similar law is in force since last winter in California, providing that the tree planter shall receive $1 for every tree planted along the public road, fronting on his own land, and thriving five years after planting.

Victorian Machinery for India.—The municipal corporation of Bombay have ordered six of Chambers' hydraulic stone-breaking machines, for the purpose of breaking stone for the roads of the municipality. It is satisfactory to the communities, as well as the inventor, says *Dicker's Journal*, to learn that Melbourne is exporting machinery to India.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

[OUR summary this week is unusually small, owing in great part to the "demoralization" of the interior press; but we will *Grant* them excusable this time, and hope that they will *Say-more* in the future about our mining progress.]

CALIFORNIA.

Alpine County.

Markleeville *Union*, Oct. 31st: The Pittsburg mill is pounding away on I. X. L. ore and will probably exhibit the bullion result from first run next week.

Butte County.

We clip the following from the Butte County paper: A handsome gold nugget, thickly veined, and nearly one-half covered with gold, was found in the Lincoln tunnel, Butte County, about 110 feet back in the drift, 2,500 feet below the top of the hill, and 800 feet above the bed of the Big Butte Creek. It contained about five lbs. of gold, worth $18 per ounce, and its value was about $1,080.

Calaveras County.

The *Chronicle* of Nov. 7th gives the following sensible and valuable remarks on mining: The only occupation in which men appear to engage without the least preparation or forethought is mining. The opinion is universally prevalent that this, our most important branch of industry, does not require the exercise of judgment or the possession of any business qualification whatever, to ensure a person to become a successful miner. "Trust to luck" is the motto, and leaving all in the hands of the fickle goddess, men embark blindly in mining speculations and enterprises, without any regard to the location of the claims they are purchasing or assisting to prospect, and with no practical knowledge of the business in which they are engaging. In early times, when every gulch contained gold, and all that was necessary to constitute a successful miner was to know how to handle a pick and shovel, and the possession of energy enough to induce men to use them, combined with sufficient discrimination between gold and mica, perhaps this loose way of prospecting was as good as any other. But times have changed greatly within the past few years. Placer diggings are among the things that were, and gravel mining is confined to hydraulic and tunnel claims, which require, as a general thing, years of labor and the expenditure of a large amount of capital to develop them. Miners, as a class, are poor, and unable to meet the heavy expenses incurred in operations of this character, and, as a natural sequence, their attention has been attracted to the more feasible and less costly task of prospecting the numerous quartz leads which traverse the State in every direction. While we cannot help admiring the spirit, energy and perseverance which have been exhibited by all classes of our citizens in the prosecution of this branch of mining, we think that bad judgment has been shown in the application of the money expended, and a lamentable lack of system displayed in the direction of the labor performed upon quartz leads in this vicinity. Too many companies have been formed, and the range of operations has been too extended. Prospecting, in order to be effective, must be thorough. One good paying claim would do more to give our mines standing and character than fifty half-prospected, undeveloped ledges, no matter how promising they may appear to their owners. That we have as rich quartz lodes in this district as can be found in the State, we sincerely believe; but the fact has yet to be satisfactorily demonstrated.

Nevada County.

Transcript, Nov. 4th: The Bavarian ledge, located on Rush Creek, and owned by Peter Coon, is one of the richest specimen ledges in this locality. A candle box full of specimens literally flaked with gold, has been taken out, and nearly a ton of first grade rock is ready for crushing.

Nov. 7th: The mines of Nevada County promise a first rate yield with a favorable winter. The quartz miners about Eureka and South Fork are highly encouraged by the results from prospecting during the summer, and many of the claims have been yielding good returns. In Meadow Lake, the Mohawk and Montreal, and several other mines are yielding good rock, have improved machinery, and the owners are delighted with their prospect. Grass Valley and Nevada mines are paying well, and our people look to them as certain and permanent sources of profit. During the past two years much attention has been given to hydraulic mining, large amounts have been invested by capitalists, and the results have so far been highly satisfactory. On the ridge the Red Rock Tunnel Co. have succeeded after years of labor and expense in opening an extensive range of rich ground. At Chalk Bluff, the Caseades, and other points, considerable prospecting has been done, and those engaged are confident of speedy and excellent compensation in the yield of their claims. On the Little York ridge, the property formerly owned by Jos. Gardner is in the hands of an energetic company, and they will do a large amount of work. In the lower part of the county, Squirrel Creek has been located and two companies organized for the purpose of working it. The North Bloomfield Gravel Mining Co. are employing a large force in building the new ditch, and as they own extensive claims in that locality and have a large capital at command will do much towards the development of mineral resources.

Grass Valley *National*, Nov. 7th: The Gold Hill mill has all the work which its 20 stamps can perform. Rock from the extension of the Dromedary is now being crushed. The rock looks finely, shows free gold in abundance, and is very rich in sulphurets. Sixty or seventy loads from a part of the North Star, which is let on contract, is awaiting its turn. Rock from this place has heretofore yielded $50 per ton.

EXCELSIOR.—Truckee *Tribune*, Nov. 7th: The Mohawk and Montreal Co's mill at Meadow Lake, cleaned up last week $10,000. Himes & Co. cleaned up 200 ounces of amalgam from 64 tons of rock crushed. The mines are said to present a very favorable appearance.

Grass Valley *Union*, Nov. 8th: Yesterday the owners of the Coe mine were paying off their debts, and on Monday the mill will again start up. The rock they are taking out looks to be rich enough to pay from $35 to $40 per ton. The short stop of the mill has been taken advantage of to put everything in the best possible order for saving gold.

Placer County.

Auburn *Herald*, Nov. 7th: John Gillard, who has been erecting a new quartz mill on the Mammoth quartz ledge, a few miles above Wells, on Dry Creek, has got it completed, and started it to work on Wednesday last.

The 20-stamp mill now being erected by McCarty & Co., on the Green Emigrant mine, will be completed and running within the next three weeks.

The San Mateo *Gazette*, says: A couple of miners at Willow Spring Hill, Placer Co., recently washed up the sum of $5,400.

Sierra County.

Downieville *Messenger*, Nov. 7th: The Orleans Co's tunnel at Little Grizzly is 1,800 feet in the bedrock. The pay channel is 1,000 feet in from daylight. Only a month ago two or three ounce pieces were taken out. Last fall this mine paid exceedingly well. At present, from $7 to $8 to the hand is obtained. This mine is a genuine blue lead. Twelve men are working at present. A contract has been given for 200 cords of wood for hoisting purposes.

The Chip's Flat correspondent writes: Considerable wood-chopping is being done here at present for milling purposes. A short distance below Chip's we saw a tunnel half blocked up in front and partially filled with water. We were told that this was a very lengthy tunnel. The American tunnel and mill machinery is still unworked, as has been the case for years.

The Mammoth Co's gravel claim is situated near Chip's. The tunnel here is 2,000 feet in length; hight, six feet below the caps. Drifting is at present being done. Seven men are now working. In two weeks twelve men will be employed. In about a week a breast will be finished at present end of the tunnel sufficiently large for two shifts of six men each to work. Present pay is not large, but better returns are expected.

The Oak Flat Co's mine is situated about one mile west from Chip's on the south shore of Kanaka. Length of lower tunnel 1,500 feet on the ledge; upper tunnel, one thousand feet on the ledge. A shaft runs down from the surface for 225 feet. This mine prospects well, the ore paying from $30 to $40 per ton. Width of ledge averages from four to five feet. Arrangements are being made to build a mill.

We collected a few items at Chip's concerning American Hill. Good rock has lately been struck in the Von Humboldt mine, where the ledge is five or six feet wide and prospects well. Two men have been working here this summer. This mine is very well opened, and a mill will be built in the spring.

Bixby's diggings are paying from $4 to $5 per day.

We next visited the Live Yankee Co's gravel claim, at Balsam Flat. Length of tunnel, 1,400 feet; average hight, seven feet. Future prospects of this mine are good.

ARIZONA.

Prescott *Miner*, Oct. 24th: Henry W. Fleury has purchased the Lamson mill, It is his intention to fit it up and run it as a custom mill. He is also negotiating with Jas. Grant for the Eureka 10-stamp mill in same district.

Rico's pack train passed through town Thursday last, bound for the Sterling mill, with sulphuret ore from the Galena mine in Big Bug district.

The tunnel in the Chase mine is now in 190 ft. The rock is hard and water plenty.

COLORADO.

Georgetown *Miner*, Oct. 22d: Huepeden, Wolters & Co. shipped on Monday last, to H. Amy & Co., New York, 702 ozs. of silver bullion, coin value $701.50.

The shaft on the Elijah Hise lode is now 82 ft. deep, with 10 inches of galena and gangue in the bottom.

Mr. Watson has struck a vein of ore in the discovery on the Coin lode, which is said to be chloride of silver. It carries native silver in abundance.

The Emmet lode, on Sherman Mountain is developing finely. At a depth of 32 feet they have a 10-inch vein of solid galena, free from zinc blende.

Prominent among the lodes worked by the Hewett G. & S. M. Co., is the Cortez, situated on the eastern slope of Republican Mountain. It has been sunk to the depth of 35 ft. The wall rocks are well defined, and the ore vein consisting of sulphurets of silver and argentiferous galena, is about six inches wide in the bottom of the shaft. The ore is quite rich assaying from $289 to $830 per ton.

Ball & Mason, at Empire, are running the Knickerbocker mill for the Disbro Bros. on the Conqueror lode, with good results. Their average yield so far, is $225 per cord, coin value. Robert Steel & Co. have started up their Chilian mills at North Empire, and are running on surface ore from the California lode.

Wm. Crossley cleaned up from his arastra last week, and his retort amounted to about $200, coin value.

Cooley & Haskins are running their mill on ore from the Big Gun lode, and have a result of $125 to the cord.

Williams, Jefferds & Co. have commenced repairing the Liebig mill to receive the furnaces and amalgamators that are now on the way from the east. They expect to be in full operation at both the Peck and Liebig mills before the first of December.

DACOTAH.

Georgetown (Col.) *Miner*, Oct. 22d: A gentleman just returned from the Sweetwater mines gives the following concerning the mines: At South Pass City, Tosler & Eddy have erected a six-stamp mill for custom work. The ores are brought there from mines five miles distant, and the results so far are as follows, viz.: Ore from the Miners' Delight lode, averages $85 per ton, coin value. Corrisa lode gives ore from shaft 15 feet deep that averages $21 per ton. The ore from the Young America lode for 38 feet, the present depth of shaft, has given an average of $60 to the ton. These, with the Atlantic and Carriboo, are the principal lodes of the Sweetwater district. The Atlantic has the deepest shaft of any there, being 70 feet in depth, showing a crevice of 12 feet in width. The material from these lodes is all of a similar character, being a smoky quartz, carrying free gold.

IDAHO.

Lewiston *Journal*, Oct. 10th: On French Creek, east of Pierce City, there are four or five companies at work and doing well. New discoveries have been made on Quartz Creek; several companies are now at work there with a fair prospect of doing well. The miners on the new diggings on Cow Creek are opening their claims and preparing for winter. On Gold Creek preparations for winter and opening claims is going forward with energy.

At Last Chance Gulch, the same operations are going on.

The diggings about Pierce City are still worked with vigor.

Oct. 24th: It is reported that the new mining district, to the north and east of Pierce City, known as Moose Creek, is extraordinary rich and extensive. It is believed that this new camp will eclipse any that has been found within the last ten years, and will furnish ground enough for 1,000 or more men to work. The prospects average on the hills, ten to twelve cents to the pan, and in the gulches from 15 to 25 cents to the pan, which warrants the belief that this new camp will exceed Florence and equal California in '49. Water is abundant, and little or no stripping, and the gravel from five to six feet deep. Nearly all from Pierce City and thereabouts have gone there, and parties and pack trains are daily leaving. There can be no doubt of the truth of this exciting news. Mr. Loewenburg has dust from there that will assay at least $17 per ounce.

Owyhee *Avalanche*, Oct. 31st: The main shaft in the Rising Star mine is now down 185 feet, yielding splendid ruby silver ore, and plenty of it. The south drift is now in 300 feet from the main shaft and shows the lode to be as large and rich as ever.

The engine house, ore house and other buildings at the Oro Fino are now completed. Everything is in tip-top shape, so that the storms of winter will not hinder the working of the mine. Rich ore continues to be taken out, and it is thought an extensive and good paying chimney has been found.

The Golden Chariot Co. have struck richer ore than ever, south of the main shaft. The mine is in splendid shape for working, and will yield millions within the next twelve months.

Repairs are rapidly progressing on the Lincoln mill, and it will be ready in a few days to commence turning out again some more of those $22,000 bricks.

Boise *World*, Oct. 31st: The editor has been on a tour through the Boise Basin, and gives the result of his observation as follows: Along on the brow of the hill across from Placerville, and down on either side of the road to the creek, a good deal of preparatory work has been performed, in the way of reservoirs and small ditches for free water, telegraphs for hydraulics, etc. Every indication is presented that the claim owners expect a prosperous ensuing season, and are resolved to make the most of it. Indeed, about Placerville are to be found the richest diggings perhaps in the Basin, and the finest gold is taken from claims in that section—some that will assay from $17 to above $18 per ounce. On the hill we alluded to above, just across from the camp, the pay is good from surface to bedrock, for a depth of from 10 to nearly 100 feet. But for lack of water to work these claims properly, it is rarely that more than a few weeks' mining can be performed in any one season.

A gentleman who just returned from the newly-discovered mines in the Kootenai country, writes to the Lewiston *Journal* as follows: The old Kooteuai camp has some few very valuable mines yet—but principally in the hands of Chinamen. Five or six days before my departure a very rich mining district was discovered, which is called Perry Creek. The mines are situated in a westerly direction from the old Kootenai camp, on a tributary of St. Mary's River. The gold in appearance is coarse and very similar to that of the old camp. Three men after a rather unsuccessful prospecting trip, struck this district in returning to Kootenai, and panned out in three days without any tools but a prospecting pan $225. In returning to the old camp the sight of this prospect raised a great excitement, and in the course of a few hours, the next morning everybody who were able to procure a canyse started out for the new discovery; so in a few hours after the news got to camp, only about a dozen men were left in the old district. Inside of 24 hours most of the men came back with prospects varying from two cents to several dollars to the pan, taken from the top dirt.

NEVADA.

Humboldt.

Unionville *Register*, Oct. 31st: The new mill of Stewart & Co. is progressing finely and will be in complete running order in about 15 days.

The ledge in the Arizona mine is well defined, and varies in width from four to six feet between the upper and lower tunnels, while the ore is regularly distributed through the vein and improves in quality as depth is gained. It has been predicted that the ore would become more refractory in the lower works, but such is not the case so far as yet ascertained, and we apprehend but little fear need be entertained of rebellious ores taking the place of that now found in the mine, and which is being so readily treated in the mills. That this ledge will be permanent and lasting in its supply of pay ore there can now be no doubt, as the developments already made show it to be of sufficient strength to hold its own in any formation that may be encountered or met with in its course downward.

Nov. 7th: The Arizona Extension boys have increased the force on their mine, and are now extracting from eight to ten tons of ore per day. The ledge is from three to

five feet wide and the ore of superior quality. At present the ore is hoisted by a windlass through a shaft 90 ft. deep, but in a few days a whim will be erected and horse power brought into requisition. Some 40 or 50 tons of ore are now on their dump, which will average $150 per ton.

G. W. Holt will have his mill running by the 15th inst. He has contracted to crush 1,000 tons of ore from the Golconda mine. This mine is growing better every day, and can furnish enough ore to supply half a dozen stamp mills.

By a private note received from H. H. McColly, of Quin's river, we learn that very promising placer gold mines have been struck in Quin's River Valley. No particulars.

Fall & Co. shipped this week, per Wells, Fargo & Co's express, 3,000 ounces of fine bullion.

Reese River.

Austin *Reveille*, Oct. 31st: During the week ending this date, the Manhattan mill of this city produced 27,484 ozs. of bullion.

Nov. 2d: Wells, Fargo & Co. shipped from their office in this city during the month of Oct. 269 bars of bullion, weighing 20,383 lbs., and valued at $341,663.95. Of this amount, $159,221.94 were shipped by John A. Paxton & Co., and $101,308.83 by the First National Bank.

On Saturday five bars of bullion, of the average fineness of .983, and valued at $7,013.07, were brought to the assay office of David Lundbom in this city from the Monte Cristo mill at White Pine.

Nov. 5th: We learned last evening that the 10-stamp mill in the Northumberland district, which was built under the superintendence of Mr. T. F. White for the Northumberland Co., was completed and running, and that its first product of silver bars would shortly be brought into this city.

Virginia *Enterprise*, Nov. 4th: Quite a number of White Pipers were in town yesterday. All with whom we conversed spoke very highly of the mines. They talk as glibly of $20,000 ore as we do in this vicinity of $50 rock. Thus far the weather has been very favorable in that region.

A gentleman who resides in Gold Hill, and who lately returned from White Pine, tells a by no means flattering tale of the new Silverado. He says that there are but two or three mines in the whole region that appear to him likely to prove lasting. The other strikes of which we hear so much are, he says, but large bunches of ore, separate from any thing like a vein, and surrounded on all sides by hard limestone—they run in no particular direction and have no walls, dip, or any other of the characteristics of a mineral vein. His idea is that the greater part of the so called mines now being worked are mere nodules of ore that have formed in cavities in the limestone. He advises his friends to stay away from White Pine.

The Gold Hill *News* says: John Church, formerly State Printer, is now in the district of White Pine. He has been prospecting around the country for several weeks, and has struck a big thing at last. He, together with others, has found a ledge, deposit, nodule, body, or other congregation of silver, which prospects splendidly. Mr. Sylvester a day or two since showed us some pieces of ore from the claim which was recently sent to them by Church himself. These specimens had been subjected to the roasting process, and showed a richer and more numerous amount of fine little globules of silver bullion than we ever before saw in pieces of the size.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.

Virginia *Enterprise*, Nov. 6th: During the month of October, Wells, Fargo & Co's shipments of bullion from this city amounted to $585,317.45, and from their office in Gold Hill $263,730.61.

Nov. 10th: Though the village surrounding the Gould & Curry mill is almost deserted, below will be found a smaller mill, belonging to that company, working what is called "slime"—which consists of the sediment of the water running away from the mill battery. This "slime" assays from $18 to $20 per ton, and the assay value of this deposit belonging to the Gould & Curry Co. is in the neighborhood, we understand, of $150,000. The working of this necessarily gives employment to quite a number of persons, for the oftener this "slime" is shoveled, and the more it is exposed to the atmosphere, the greater becomes the yield. After much shoveling and exposure to the air this "slime" will yield about 80 per cent. of its assay value. Below this "slime" mill of the Gould & Curry are several small mills employed in working "tailings," which yield a living business, if not good profits. In leaving the mills the road passes on over a sage brush plain which, as you enter upon it, presents to the gaze many boulders. A little further on, however, the boulders disappear, and the soil, though sandy, gives evidence of ability of rewarding the husbandman with an abundant harvest. Thousands of acres present themselves to view with a surface as level as the eye could wish to see. Water and the requisite labor are all that is wanted to make this desert bloom, and it is believed that the water could be obtained by the sinking of wells and pumping by windmill process. But we pass over this magnificent waste, and after a short drive reach Dayton. As we enter the town from the north, the large mill formerly belonging to the Empire Co., but now owned by the Combination Mill Co., is thundering away upon the ores of the Comstock.

Statistical Items.

Utah claims a population of 80,000.

There are 90,000 mowers and reapers annually made in the United States.

The slate pencil factory near Heath's Ferry, Vermont, turns out 100,000 pencils per day.

The highest inhabited place on the globe is Ancomara, Peru, which is 16,000 feet above the sea.

The zinc works at Potosi, Washington County, Mo., are turning out 1,200 to 1,400 pounds of zinc per day.

The entire product of the Lake Superior copper mines from 1845 to the end of 1867 was 100,000 tons. The product of 1867 was 11,735 tons.

There are fifty-eight oil refineries in Pittsburg and neighborhood, which employ 700 operatives, whose wages amount to $500,000 per annum.

According to statistical returns from India, it appears that in 1866, in the Presidency of Madras alone, there were 1,899 deaths from bites of serpents.

The average yield of wheat per acre in thirty-two States east of the Rocky Mountains last year, was 11.17 bushels, and the average price $2.23. Connecticut furnishes the largest average per acre, 17.5; South Carolina the least, 6.4.

A late *Quarterly Review* estimates the population of the world at 1,350,200,000. Of these 195,000,000 are Roman Catholics, 96,000,000 are Protestants, leaving more than ten hundred and fifty millions of pagans and Mohammedans.

Gas Generating Apparatus.—A curious machine has been invented for generating gas, which is cheap, simple and durable. It consists of a cylindrical vat or tub, which is filled with pumice stone. Over the latter is poured gasoline, which consists of a compound of the most volatile portions of petroleum oil. The inflammable material is poured over the stone until the latter ceases to absorb the gasoline, when the surplus liquor is drawn off through the means of a faucet at the lower end of the vat. Above the vat is placed an air chamber in which bellows, operated by machinery propelled by a spring like clock-work, are placed. The bellows force air through an india rubber tube into the vat where it comes into contact with the generated gas and forces it through pipes to the burners. The light produced is steady and brilliant; and in point of economy, we are told that it far exceeds anything in use. As soon as the gasoline escapes or evaporates from the pumice stone, the latter is again saturated, and so on for any length of time. The safety of the apparatus for burning gasoline is a very strong recommendation in favor of its general adoption.

From Oakland to San Pablo.—For months past the stages running between this city and San Pablo, have been crowded with passengers, a correct indication of the amount of work being done in that portion of the country between this city and San Pablo. Land is being continually subdivided, and farms are becoming smaller. As a consequence the population is greater and there is more prosperity.—*Oakland News.*

Cotton Culture in Tulare Valley.—Fine cotton is grown on the lands of Jack & Kincaid, Tulare County. Forty-eight bales have been shipped, this year's being the third crop. In the opinion of competent judges it will compare favorably with Tennessee or Mississippi upland cotton. There are, no doubt, large tracts of land in various parts of the State, eminently adapted to the production of this staple, and its cultivation can but prove a source of profit.

Engineering.

What is "Engineering?"—"The term engineering properly includes within its scope every department in which the inventive and constructive powers of man are employed to ameliorate the condition of the race; whether it be in the manufacture of the engine that furnishes the motive power of factory or car or steamer, the structure of the pavement under his feet, or the laying of the pipes and mains that supply his dwelling with gas or water."—*American Artisan, Oct. 7th.*

Hydraulic Pipe Engineering.—On the north side of Wood's Creek, Tuolumne County, Messrs. P. J. Walsh, and J. R. Watkins, water-pipe contractors, have laid a hydraulic pipe in accordance with a survey made by R. M. Wilson, U. S. Deputy Surveyor of Mineral District, No. 8, which descends the slope of the mountain, a distance of 4,800 feet, with a depression of 800 feet, passes under the bed of that creek, and up the mountain on the south side a distance of four thousand feet, with an elevation of five hundred feet to the point of discharge. The perpendicular pressure sustained by the pipe at the lowest point is 684 feet. It is guaranteed to carry 300 inches of water with safety at one time, and it has been tested sufficiently to know that it has a still greater capacity. It is supplied with self-adjusting air valves, and lies under the tremendous pressure of water within it, without even a tremor or vibration in any portion of the whole line. The pipe is made of sheet iron, and is eleven inches in diameter. The inlet is 200 feet higher than the outlet, giving that amount of pressure to the column of water passing through the pipe.

The Land Surveyors are still busy in mapping and plotting surveys for private parties. Many of these are in considerable tracts lying in Tulare Valley, and in the southern counties. In mine surveying the extension of the mineral land Act to gravel mines, has increased somewhat the labors of the Deputy U. S. Surveyors of the several districts.

California and Oregon Boundary Survey.—The Yreka *Journal* of Oct. 30th has the annexed:

We learn a few items in reference to the California and Oregon boundary survey, through E. W. Potter, who has just returned from his trip to see if anything had happened to County Collector Ream, in coming from Surprise Valley. He met the surveying party at Lost River, where they were camped awaiting assistance from Fort Klamath to get their wagon out of Lost River, which was upset and lodged in the stream where it is about 25 or 30 feet deep. The surveying party consists of eight men, aided by seven soldiers, under charge of Daniel A. Major, U. S. Astronomer and Surveyor, with John J. Major as Assistant. The party expected to get their wagon out in a day or two, and in ten days calculated to get as far as Cole's Mountain House on the Siskiyou Mountain. The initial point at the intersection of the Oregon, Idaho and Nevada lines, is just 12 miles north of Fort Bidwell, which locates all of Surprise Valley in California. The altitude of Surprise Valley is 4,680 feet, and it was the intention of the surveyor to take the altitude at different points but for the breaking of his barometer. From the initial point to Tule Lake the distance is 69 miles, and to the natural bridge on Lost River about 10 miles further. The line is about half a south of the natural bridge, and leaves inside of California nearly all of Tule Lake, all of Clear Lake and half of Goose Lake. The surveyor had no idea where the exact line would run at Klamath Lake, but believed it would bring a large portion of Little Klamath Lake in California.

Col. Gowan, the American who raised the ships sunk at Sebastopol, is to make an attempt on the Spanish galleons which the Dutch and English fleets sent to the bottom of Vigo Bay, somewhere about 1702.

The Pacific Dredging Company have recently ordered from New York two of Morris & Cummings' patent dredges. They will cost about $35,000 each, and are expected to arrive in about two months.

Enterprises and Developments.

A Yankee drives an omnibus over the new macadamized road from Jaffa to Jerusalem.

Extensive horse-breeding farms have been established at the Cape of Good Hope for the supply of horses to India.

The ramie nettle planters in the East think they can prepare the fiber at a cost of two cents a pound, and sell it for one dollar.

A Northern capitalist is purchasing all the locust trees in the vicinity of Lynchburg, Va., to supply ship-builders in Europe.

"The Enterprise."—A splendid new steamer, owned by the farmers along the Upper Sacramento, is making regular trips up and down the river.

The Atlantic cable is earning at the rate of $2,000,000 per annum in gold, equal to $2,900,000 in greenbacks, or at the rate of about fifty per cent. per annum on its cost.

Trade in Old Horseshoes.—It is stated that a new trade has been opened up by the Chinese in Australia, who are buying up worn out horseshoes for export to China, where they are eagerly purchased by the gun manufacturers.

Beet Sugar.—An experienced sugar refiner of New York is about to establish a beet sugar factory in Buena Vista county, Iowa. The machinery is to come from France at a cost of $100,000. Five thousand acres of land to grow the beets have been purchased.

Logging and Lumbering at Puget Sound.—There are over eighty logging camps on Puget Sound, employing over 1,000 men and seven steamboats constantly, besides an occasional raft by others, in towing logs to the mills, as is the case with three camps on Mudd Bay, which log for the Port Madison mills, while others are rafted to the mill without towage.

The black walnut is a rarity in California, but a fine grove of an indigenous species, including trees a hundred feet high and five feet thick in the trunk, in Foss Valley, Napa County, has lately attracted some attention. On Walnut Creek, there are a number of the same kind of trees. They are valuable for their nuts, and wood, and are beautiful shade trees, but grow only in moist soil.

A vast deposit of pure chloride of potassium has been discovered in a salt mine in Hungary, and a similar deposit has been worked for about five years in Prussia. Layers of chloride of potassium exist in connection with most inland basin salt deposits, and doubtless also in those of the interior of Nevada, Utah and Arizona; but labor is so much cheaper in Prussia, and the deposits there are so extensive, that the mining of it in this country to supply the world with the variety of chemical products obtained in connection with the chlorides, could not pay for many years to come. Iodine, bromine, and other valuable chemicals are won as side products.

Our Lime.—Though limestone is extensively interstratified in the Tertiary and Cretaceous rocks of the horizontal lying formation at the western margin of the Sierra Nevada, the lime which supplies San Francisco and the greater part of the State, comes from Santa Cruz. Three large schooners, the Adrianna, the Alfred Adams, and the Fanny Gilmor, are regularly employed in bringing lime from Santa Cruz, their capacity being 2,500 barrels each, and the vessels making four round trips per month. A few transient schooners are also engaged. From 120,000 to 130,000 barrels are landed here annually. San Francisco is the distributing point of the article for all this part of the country; and it is also exported, mainly to the Sandwich Islands, the lime made of coal there being of an inferior quality. The Santa Cruz lime is unquestionably equal to the best in the world. None that has ever been imported here can compare with it. The ledges occur in the coast range of hills, a few miles back of Santa Cruz, and the quality of the rock, which is very abundant, varies, as is the case with all vein mining. A face of the rock is obtained in the side hill, which is steadily worked against. That locality is particularly adapted to the business, owing to the extensive redwood forests in the vicinity for burning. The old fashioned "draw" kilns are principally used at Santa Cruz, in preference to the "perpetual" kilns, where the fires are kept up for several consecutive months. The hair used in making mortar is also brought from that vicinity, where a number of tanneries are in operation.

San Francisco:
Saturday Morning, Nov. 14, 1868.

Notices to Correspondents.

G. R. W., Grizzly Flat, El Dorado County. We are uot aware that there is any legal standard bushel in this State, that has been defined as such by statutatory enactment. The legality of such a measure in such case, therefore, depends upon custom. The measures of capacity in customary use iu the United States, have been derived from England, which had many local standards, the most celebrated and most usually adopted, being the Winchester bushel, which very nearly approximates to the Imperial measnre as fixed hy act of parliament. This Imperial bushel is fixed at 1,109.104 cubic inches. The apothecaries or wine measure, seems to have been adopted in the United States, of which the gallon contains only 231 cubic inches, consequently the bushel would only cousist of 924 cubic iuches. The wine measure was used in England only in veuding wine, oil, and other expensive or foreign liquids; the Winchester measure for beer, milk, and home productions, and all dry goods that were uot of a textile character, such as seeds, grain, etc., and charcoal, would he measured hy a similar standard. Now, however, all are sold by the Imperial standard gallon of 277.276 cubic iuches, wherever measure in place of weight is employed for the purpose alluded to, he the snbstance either liquid or solid. Respecting the rule of weigbts for selling charcoal, we cannot give you any information.

WOOSTER, Santa Clara.—The best mode of case-hardening iron will depend in a great measure upon the fiueness or coarseness of the work needed, and also whether the matter to he accomplished is to he regardless of expeuse, or economy is a desideratum. If the first, no mode has yet heen found superior to that employed by gunmakers in tempering patent breeches. This is done by placing the breech, surrounded by powdered hones, in an iron hox, and heatiug it red hot for souetime. This is sometimes done with prussiate of potash iu place of boncs. For larger matters, the best method is to cover the matter to he case-hardened with a coating of plumbago, and after bcing well dried; plunging the article into some molten cast iron until the molten iron will freely flow from the article on being withdrawn from the melted metal.

SEWERAGE.—Dr. A. B. Stont has published, in pamphlet form, his admirable paper on "Hygeine, as regards the Sewerage of San Francisco," printed originally iu the *California Medical Gazette*.

THERE are thirty millions of hearing vines in California, with a capacity of fifteen millions of gallous of wine and one million gallons of brandy, which at the lowest cstimate represents a yearly value of $8,000,000.

REDPATH is to visit Salt Lake and write of the Mormons.

Chemical and Metallurgical Establishments.

THE GOLDEN CITY CHEMICAL WORKS.

These works are located near the corner of Brannan and Eighth streets, and are quite extensive, being devoted specially to the manufacture of sulphuric, nitric and hydrochloric acids. H. P. Wakelee is the superintendeut, and one of the leading proprietors. Space and facilities are afforded here for the manufacture of much more of these products than the market at present demands, though an eye to the future will not fail to jnstify the extent of the preparations for our thriving industries. Liebig says the quantity of sulphuric acid used in a community indicates truly the general development of other industries in their midst. How true this is can hardly he conceived without some knowledge of the extent and manner iu which sulphuric acid enters into nearly every hranch of technological chemistry and manufacturing.

The process of manufacturing the common acids is very simple. It is in questions of economy concerning the details that the manufacturer must exercise his skill. Sulphurous acid (SO^2) is obtained hy burning sulphnr iu air, and this is changed to sulphuric acid (SO^3, containing an additional equivalent of oxygen) by mixing the SO^2 with fumes of nitric acid (NO^5), which readily give off one equivalent of its oxygen to the snlphurons acid. Enormous lead chambers are used to condense hoth the sulphuric and the nitric acids, and the latter, heing more volatile, is condensed last, and so separated and used over and over again. By boiling in glass hottles the acid is afterwards concentrated to 66 deg. Baumé. Platinum vessels are not found necessary to make the products required for this market.

Nitric acid is made by retortiug Chili saltpetre, or nitrate of soda, with sulphuric acid iu a horizoutal cylindrical retort, lined with brick to preveut the fumes from attacking the iron ; these are led over into a series of stone jars containiug water, and are there condensed. Purification and concentration are effected by repeating the process—by distillatiou, as there are now no solids iu the case. In making nitric acid, the uitrogen iu the nitrate of soda leaves that suhstance and joins the oxygen of the sulphuric acid, making NO^5, while the soda and sulphur remain behind in the retort, also combining, and making sulphate of soda or glaubers salts. This is stacked in a shed, and part of it is used to make sal soda hy hurning sawdust with it, which carries away the sulphur and leaves carbon in its place—being carbonate of soda.

Hydrochloric or muriatic acid ("salt acid") is made like nitric acid, only that common salt (chloride of sodium) is used instead of the Chili saltpetre, the remnant in the retort heing likewise sulphate of soda, while the suhlimated chlorine is led into water jars, and there combined with the hydrogen of the water, making H Cl.

All the acids as used are dissolved in water, aud their strength is the proportion of pnre acid to water. It is tested by the hydrometer, iudicating the specific gravity of the fluid, and the resnlt is expressed according to a scale inveuted by Baumé,

An acid factory is generally a very dilapidated looking establishment, iu consequence of the dcstructive effects of escaping gases. The Golden City Works appear to be exceedingly well arranged, having been huilt by an Englishman,—Mr. Robertson, of Newcastle, if we remember correctly,—and the management is in the hands of Mr. John Cairns, who is evidently a master of the business. The laboratory is in the charge of Mr. Howden.

Not having had the fortune to meet Mr. Wakelee, the Superintendent, we are unable to furnish, at the present time, any correct figures as tc tho size aud capacity of the works, aud the manner iu which their acids are chiefly disposed of after they are manufactured.

THE LEAD AND SILVER SMELTING WORKS AT NORTH BEACH.

An interesting visit to this place we find from want of time and space it will be more convenieut to defer giving an account of till next week. Prof. Thomas Price, the manager, is one of the most energetic of men, and it requires but a glance through the works to convince any one initiated that he is by no means a hunglr. The location of the works is judicious, as the slag and refuse products can be dumped into the sea to make dry land, instead of incurring the usually necessary expense of wheeling off rapidly accumulating matter to a considerable distance iu order to get it out of the way. Another evidence of the probable speedy success and growth into importauce of these works is the sonndness of the basis on which they are operating; attempting to treat only such ores as can be worked under preseut circumstances with economical results—the lead and antimonial ores and products from the interior, of which there is a two years' working supply on hand—leaving cupriferous and refractory auriferous ores to be sent to Swansea, either in the form of concentrated raw material, or of matte, as is done from the Colorado smelting works. A great advantage will result to tho entire coast from the success of an efficient first-class metallurgical establishment of this kind in San Francisco, since scores and hundreds of really valuable mines are to-day lying unworked and dead in the stock market, which might be worked to great profit if the metallurgical problem were satisfactorily solved.

COMMERCIAL PRODUCTS FROM SEAWEED. On the English and Irish coasts seaweed is used for manure, for which purpose its chief value consists in having a large proportion of mineral salts,—sometimes 38 per cent. of the dried weed;—in addition to which there is about three per cent. of nitrogen, which is capable of forming ammonia, a valuable fertilizer. Soda, the principal mineral ingredient, is now made from common salt hy Leblanc's method; and the kelp fires in the rocks and reefs would have gone out altogether, hut for the discovery of the red tinged iodine, which is now derived from the same source. Bromine may he ohtained from seaweed, hut a more economical source has heen fonnd in the salt beds of Prussia. Marine sugar or maunite is derived from many kinds of seaweed. From others mucilage may be ohtained which by prolonged hoiling with dilute oil of vitriol has heen made to yield arabia, which constitutes the pnre gummy suhstance of gum arabic. A seaweed gathered on the coast of Ceylon has long heen used in the manufactnre of an edible jelly, and the value to invalids of the demulcent drink made by digesting Irish, or as it is sometimes called, Icelaud moss in water, is well known. The French have used seaweed to make wadding for cannon.

PHYSIOLOGICAL CHEMISTRY is a hranch of chemical science the most difficult and obscnre. The great difficulty depends not so much upon the obscurity which surrounds the natnre of life itself, as the essential character of every description of force; and of the mysterious tie which exists between matter and force,—a question which has baffled the penetration of the profoundest philosophers, and which it is not probable that human intellect will ever be capable of elucidating. The chief difficulty in explaining the phenomena of organic chemistry arises from the extraordinary delicacy of the arrangements hy which the various metamorphoses of the organic kingdom are produced, combined with their complicated character. Other obstacles are also to be found, especially those arising from the great facility with which every organic suhstance, particularly those in the fluid state, undergo changes after the vivifying principle has ceased, the *rationale* of which has eluded all scientific scrutiny.

Antimonial or Hard Lead.

Some hundreds of tons of antimonial lead have been shipped from the works of Mr. Nason, at Oreana, in the Humboldt country, Nevada, by the Pacific Railroad since its completion in Juns last, and are now undergoing the process of "improving" or refining, to get rid of the antimony and what little arsenic there may he in it hy oxidation, at the North Point Smelting Works. Mr. Nason has been in this city for some days past, cugaged in sampling his products for assay. Though he has all the appliances for refining and cupelling at Oreana, and has heretofore heen shipping considerable quantities of hullion obtained hy the regular rontine of lead smelting, he finds since the railroad is completed that he can dispose of his hard lead in this city on advantageous terms at once—simplifying his operations in the vicinity of the mines, at the same time that he avoids having to pay a large extra price for fuel, costing $18 a ton of product in Nevada, to $3 a ton in San Francisco. Meantime the change is fouud equally advantageous to the smelting works in San Francisco.

For his reverheratory lead refining furnaces Mr. Nason has heen using sage hrush, and for his cupola (reducing) furnace, charcoal, which was hurnt in that vicinity. The ores are chiefly white lead—cerusite, or carbonate of lead—a noteworthy fact in the history of ore deposits, by reason of their very extensive occurrence in that country.

PERSONAL.—Mr. R. W. Raymond, Commissioner of Mining Statistics for the Pacific Coast, has arrived in New York.

Prof. Silliman is ou a profcssional tour in Colorado Territory.

Prof. Chas. H. Hitchcock has been appointed State Geologist of New Hampshire. He has already entered upon his labors in the field.

Thomas Dicker, tho founder, and until recently the editor, of *Dicker's Mining Record*, published at Melbourne, Australia, has dissolved his connection with that journal, and is about to open a miuing agency in Loudon.

Gardiner F. Williams and J. E. Davis, have recently returned home from several years' stay at the Mining Academy at Freiberg, Saxony.

Baron vou Koschkul has gone down tho coast.

Mr. Nason, of Oreana, Nev., aud Major Sherman, of White Pine, are in town on business.

J. F. Kidder, C. E., has heen appointed engineer of the Sau Joaquin Valley Railroad.

Wm. B. Treadwell, C. E., one of the engineers of the Central Pacific Railroad, has just arrived from the eastern end of the road, and purposes spending the winter in this city.

A. J. Bowie, M. E., has gone to White Pine.

JOINT STOCK COMPANY MANAGEMENT.—The English joint stock mining companies, whose operatious extend all over the world wherever undoubted wealth is found under the soil, hold stated (quarterly or annual) public meetings, at which as many as possible of the stockholders are expected to attend and to ask questions of the managers, to discuss the prospects and proposed operations of the company in detail, and where the press is desired to be represented, in order that full and satisfactory information may be afforded to all who are interested. The reports of these meetings occupy a large amount of space in the English local and mining journals. The first and most obvious results of such open dealings are, general confidence in the investments, and efficiency in regard to the management.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

New Publications.

A TREATISE ON STEEL; Comprising its Theory, Metallurgy, Properties, Practical Working, and Use. By H. M. C. Landrin, Jun., Civil Engineer. Translated from the French with notes, by A. A. Fesquet, Chemist and Engineer. With an Appendix on "The Bessemer and Martin Processes for Manufacturing Steel," from the Report of Abram S. Hewitt, United States Commissioner to the Universal Exposition, Paris, 1867.

All who are interested in iron and steel, whether in the way of producing or manufacturing, will find this manual a useful one, for reference as well as for study. Within a few years, advancements of such importance have been made in the production of steel by direct processes, in which large quantities of common malleable iron are transformed by economical wholesale methods into that degree of combination with carbon which we call steel, and which is found so far superior for almost every kind of use to which iron can be put, that a book on the subject supplies a really urgent demand. These iron and steel manipulations are interesting of themselves, in a general way, to all who have ever chanced to have the opportunity to observe such a grandly simple chemico-metallurgical manipulation as the Bessemer process for example.

In this book the author gives in small compass an insight into the whole question of the production of steel, including the selections of the ores or kinds of iron and of the fuel to be employed, and the apparatus and treatment to be preferred. The book enters into the history of the art and explains the various processes and methods long used on the small scale on which only they have been applicable, as well as the new processes of Bessemer, Chenot, Taylor, Uchatius, and others, which contemplate—and the first named one especially practically effects—the manufacture on the large scale necessary for an extensive substitution of steel for iron. The report of Mr. Hewitt, given as an appendix, is valuable as showing the present state of steel industry. For sale by A. Roman & Co.

AMERICAN HOUSES: A Variety of Original Designs for Rural Buildings. Illustrated by twenty-six Colored Engravings, with Descriptive References. By Samuel Sloan, Architect, Author of "The Model Architect," "City and Suburban Architecture," "Constructive Architecture," etc.

This is a collection of sixteen different designs, with perspective views and ground plans, for country dwelling houses, churches, etc., which will be found of value to prospective builders. The descriptions in type are brief and distinct, making it a handy reference book for the selection of a suitable plan or design.

PRESIDENT OF THE STATE UNIVERSITY.—At a meeting of the Board of Regents of the State University, held at their rooms on California street, on Tuesday afternoon, all but one member of the twenty-two being present, Gen. George B. McClellan was elected to fill the office of President, by twelve votes, while the Rev. Horatio Stebbins received five votes, Prof. William Henry, of the Smithsonian Institute, one vote, and F. L. Olmstead, one vote. The names of those who voted for Gen. McClellan were not reported, but it is understood that he was elected strictly by a partisan political vote, the Board being composed as follows: Democrats—Messrs. Haight, Hager, Holden, Fitzgerald, Ryland, Hammond, Archer, Parker, Butterworth, Doyle, Watt, and Moss. Republicans—Messrs. Dwinelle, Stebbins, Felton, Hallidie, and Low. Reed was absent. We have no doubt that Gen McClellan will accept the position.

AN "ADVENTURER IN MINES" writes to the London *Mining Journal:* "The metals are at a paying price for young mines, but old mines get more expensive every year, after 400 yards deep, and very few of them pay after such a great depth. More crosscutting and adit driving ought to be encouraged. This is the true way to discover a mine."

UNITED STATES AND FOREIGN

PATENT AGENCY.

DEWEY & CO.,

PUBLISHERS MINING AND SCIENTIFIC PRESS.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intentions of becoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers with a copy of the laws governing the same, but does not seek to point out its incorrectness, unless there be some glaring defect.

Our fee for a caveat varies from $10 to $15. The Government fee is $10.

Who Can Obtain Patents.

In the United States persons of either sex, and of any age, may obtain Letters Patent if they are the first and true inventors—and not otherwise. All foreigners (except those of the Provinces of Canada, other than New Brunswick) are entitled to the same rights and privileges as inventors and patentees, as our own citizens.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Confidential Advice.

We invite consultation in person or by mail. Communications kept inviolately secret, and honest and reliable advice given. Our permanent business interests guarantee, and the thousands on this coast who have consulted us will testify, to our strict compliance with our obligations to inventors.

Advantages of Our Agency.

Inventors on the Pacific Coast can sign the papers at once, and save at least two months' time in securing patents. When desirable, they can visit and give us personal explanations—better than written instructions.

We assist in bringing valuable inventions to the general notice of the public throughout the Pacific Coast by illustration or description in the columns of the MINING AND SCIENTIFIC PRESS.

From long experience in the business, and an intelligent and thorough understanding of the objects and peculiar characteristics of California inventions, we are able to present cases more intelligently to the Examiners at Washington than *any other agents.*

We guarantee inventors against losing their cases by delay, or the loss of their money in remitting.

Patents for inventors on this coast are finally secured cheaper through our agency than any other, however flattering may be the inducements offered at the commencement by others.

Extensive practice gives us great facilities, securing regularity in the transaction of our business, which extends to EVERY COUNTRY IN THE WORLD where patent laws exist.

Information for Inventors,

Printed in circular form, containing list of Government and other fees, sent free.

We draw up legal assignments for patentees; record assignments in the Patent Office; procure copies of United States and foreign patents; make examinations here and at Washington regarding the patentability of inventions; take up and prosecute rejected cases, depending upon success for our fees; reissues taken out; interferences prosecuted—in fact, every legitimate branch of the patent agency business is thoroughly conducted by us here and our branch agency in Washington.

California inventors should beware of placing their inventions and money in the hands of persons not well known as honest, responsible and capable.

DEWEY & CO.,

414 Clay street, below Sansome, San Francisco.

A. T. DEWEY. W. D. EWER.

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the PRESS from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

1T
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and breaking out on any part of the
body, and also removes pain
of every name or nature instantly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists everywhere, and at Moore's
office, 539 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from actual tests.

AGENTS WANTED FOR

SUNSHINE AND SHADOW IN NEW YORK

Matthew Hale Smith's New Book.

This is the most popular work ever introduced on the Pacific Coast. It outsells every other publication. Agents report from 60 to 150 subscribers per week. If you wish to know how fortunes are made and lost in a day; how shrewd men are ruined in Wall street; how countrymen are swindled by sharpers; how ministers and merchants are black-mailed; how gambling houses and lotteries are conducted, read SUNSHINE AND SHADOW IN NEW YORK, and learn about New York bankers, merchants, brokers, editors, police, military, detectives, gift swindlers, pickpockets, etc., with biographical sketches of all the prominent men in the great metropolis.

Agents desiring territory for this rapidly selling book should apply immediately to E. J. TRUMBULL & CO.,

20v17l1p1m 426 Montgomery street, Room No. 5.

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

CASES OF THE COLLINS METAL (IMPROVED ONOIDE)

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notice that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full Jeweled Patent Levers;* those for Ladies an improved Escapement, better than a lever for a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. Those for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $6. Also, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part of the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is,

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well known among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It keeps accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends, and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office State Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E. COLLINS & Co.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid bill on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,982. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. PHIPPS.

Address,

C. E. COLLINS & CO.,

37 and 39 Nassau street, New York.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.

How Concentrated;
And How Worked;

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 2v15tf

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

EXTRAORDINARY GOLD YIELD.—We gave, recently, a portion of a letter to the London *Mining Journal* from the new gold fields in New Zealand. The same paper for Oct. 3d has another from the same pen, which gives, from a private letter, some extraordinary figures in reference to the Hauraki, or Thames Gold Field. The writer says: "The newspapers will tell you what we have done during the last fortnight, so that I need only add that this claim (Hunt's) turned out over 5,000 ounces of melted gold as the result of four days' crushing; and, on the whole, the second weeks' work shows no falling off. The Panama steamer, leaving Auckland on August 3d, will take about 10,000 ounces from this claim alone, to be forwarded to the Union Bank, in London, and this the result of twelve days' crushing. Of course, we cannot expect to keep up this amazing yield, but even if it should be reduced to 1,500 ounces a week, that will allow of a satisfactory dividend. The price of the Thames gold is low, in consequence of the admixture of silver, so that about 2*l.* 16*s.* an ounce is all we get at present. The machinery, kiln, furnaces, and shops have cost a round sum of money, but they are all paid for. It is probable we shall be obliged to work only four stampers for want of water to drive more. The steam engine is of 20-horse-power, and takes a great deal of water. We must deepen the well, and if that does not suffice, erect a water-race for two miles from a neighboring creek. Fifty hands are constantly employed at high wages. Hitherto everything has gone on smoothly."

DISCOVERY OF COAL ON THE HUMBOLDT. We were shown by Judge Carter one day this week, says the Humboldt *Register* of October 17th, some samples of coal taken from the outcrop of what appears to be an extensive coal field, situated about eight miles from the Humboldt River and below Gravelly Ford. The samples in Judge Carter's possession burned very freely, giving out the unmistakable bituminous smoke and odor, and in appearance resembled exactly the coal found to the east of Salt Lake along the line of the Union Pacific Railroad. The coal basin is said to be several miles in extent, and its discovery at this time seems almost providential. Its proximity to the railroad in a part of the country where fuel of any kind could not be obtained without a long reach of transportation, will be of incalculable advantage to the railroad company, and will insure for the fortunate discovers a fortune of no mean proportions. The *Register* having been presented with a quarter section of coal land, we go up in a day or two to make an examination of the premises.

"SAFETY" EXPLOSIVES.—Dr. Nisser makes two compositions, non-explosive while apart, and sifts them together when required for use. The powders, therefore, can be stored and transported with perfect safety. The ingredients of one composition, are mainly chlorate of potash and niter; the other is composed of sulphur, woody fiber, and some cheap carbonaceous materials. When sifted together a powder results, which, from experiments made in Cornwall on some of the hardest granites, seems to possess about four times the strength of ordinary blasting powder, and costs rather less than blasting powder.

COST OF RAILWAY SLEEPERS.—We have over 40,000 miles of railway in this country. The average life of a railway sleeper is seven years. There are 2,112 to a mile. The average cost is 50 cents each. Thus our sleepers are costing us $150 a mile every year for each of the 40,000 miles in the Union. The sleepers on the English roads last on an average fourteen years, and when properly treated with preserving substances they last for a century.—*J. B. Lyman.*

PAPER BOXES.—A machine has been invented in Albany, N. Y., which makes paper boxes directly from the pulp. The latter is poured into a vat, passes through two pipes, and is shaped on four "formers" into perfect boxes. These are then passed through a steam dryer, and made ready for finishing and coloring, which is also done by machinery. This machine, worked by six men, turns out 12,000 boxes per day.

SUGAR BLEACHED BY ELECTRICITY.—The Loodon *Times* quotes from *Travelers' Circular* that one of Wilde's magneto-electric machines had been set up in a sugar refinery with the object of bleaching sugar by means of a powerful stream of electricity. The machine is no doubt employed to ozonize a large volume of air which is forced through the syrup, the ozone acting as the bleaching agent.

The Last Half Century the Greatest.

The following is part of a racy article in the *Spectator:*

"Few phenomena are more remarkable than the degree in which—the progress of mankind in those contrivances which promote the comfort of daily life—has been concentrated in the last half century. It is not too much to say that in these respects more has been done in our own lifetime than in all the previous lifetime of the race. It is in the matters of light, locomotion, and communication that the progress effected in this generation contrasts most surprisingly with the aggregate of the progress effected in all generations put together since the earliest dawn of authentic history. The lamps and torches which illuminated Belshazzar's feast were probably as brilliant, and framed out of nearly the same materials, as those which shone upon the splendid fetes of Versailles, when Maria Antoinette presided over them, or those of the Tuileries during the Imperial magnificence of the First Napoleon. Pine wood, oil, and perhaps wax, lighted the banquet halls of the wealthiest nobles, alike in the eighteenth century before Christ and in the eighteenth century after Christ. There was little difference, except in finish of workmanship and elegance of design, between the lamps used in the days of the Pyramids, the days of the Coliseum, and the days of Kensington Palace. Fifty years ago, we burnt the same articles, and got about the same amount of light from them, as we did five thousand years ago. Now, we use gas, of which each burner is equal to fifteen or twenty candles; and when we wish for more can have recourse to the electric light or analagous inventions, which are fifty fold more brilliant.

The same thing may be said of locomotion. Nimrod and Noah traveled just in the same way, and just at the same rate, as Thomas Assheton Smith and Mr. Coke of Norfolk. The chariots of the Olympic Games went just as fast as the chariots that conveyed our nobles to the Derby, "in our hot youth, when George the Third was King." When Abraham wanted to send a message to Lot, he dispatched a man on horseback, who galloped twelve miles an hour. When our fathers wanted to send a message to their nephews, they could do no better. But the progress in the means of communication is the most remarkable of all. In this respect, Mr. Pitt was no better off than Pericles of Agamemnon. If Ruth had wished to write to Naomi, or David to send a word of love to Jonathan when he was a hundred miles away, they could not possibly have done it under twelve hours. Nor could we to our friends thirty years ago. In 1868 the humblest citizen of Great Britain can send such a message, not a hundred miles, but a thousand, in twelve minutes."

MANUFACTORIES IN GREAT BRITAIN.—England still maintains her supremacy as an exporting nation, yet there are indications of a great depression in several departments of industry. In Germany and Belgium labor is cheap, machinery plentiful, and capital has recently directed itself in an eminent degree to manufacture. Hence, over 1867, there is a decided decrease in the British exports of carpets, druggets, and cloths, while '67 shows a falling off from the preceding year. Meanwhile, the money value of these exports decreased nearly six millions of dollars in gold. Linen shows an extensive falling off; so likewise, haberdashery, apparel, and machinery. The exporting beer trade indicates a loss of nearly a million over last year. In coals, tin, copper, and iron there were large exportations in both crude and manufactured materials. Nevertheless, the London *Times* remarks that what was gained in quantity was lost in values; all classes of goods exhibiting a depression in rates of sale. The loss of England is, however, the gain of other nationalties. All the populations along the Baltic Sea are enriched from the increase of their manufactories. In the United States, despite the heavy internal tax, industrial pursuits indicate a steady increase.

FORTY MILES OF CARS.—The Reading Railroad Company own 16,355 cars of all kinds, and 268 engines. Were these cars and engines all placed in line on their track, commencing at Mt. Carbon, the opposite end of the string would reach to Exeter station, a distance of forty miles.—*Penn. paper.*

SAN FRANCISCO
Pioneer Screen Works,
JOHN W. QUICK, Manufacturer.
Removed to Vulcan Iron Works, Fremont street, between Mission and Howard, San Francisco.
Screen Punching in all its branches, at rates reduced from 25 to 40 per cent less than the established rates. I can furnish Improved Quartz Screens several sizes finer than any Screen ever punched, giving universal satisfaction, and for strength, cheapness and durability are not excelled. Also, Punched Screens of all sizes and fineness made from all qualities of material, for Quartz, Cement, Flour and Rice Mills, etc. Screen Punching made a specialty; therefore milimen forwarding their orders to me will receive none but the best. Orders solicited.
N. B.—J. W. QUICK is the only competent and successful manufacturer of Screens in the State, having made Screens for the principal mills in this State and adjoining Territories for many years. Quartz mill owners using punched Screens which have universally failed to give satisfaction, when visiting the city will please call and see me 5v17-1y

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR G. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v16 3m

RADICAL CURE
—OF—
RUPTURE!

Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process, 624 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets.

DEWEY & CO.,
American and Foreign Patent Agents,

Publishers and Proprietors of the MINING AND SCIENTIFIC PRESS, the only well established successful Patent Agents on the Pacific Coast, will give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing information for inventors sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be car ful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Oldest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,
Patent Agents, Publishers, Book and Job Printers, 414 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books.

THE MINING AND SCIENTIFIC PRESS is now in its SEVENTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California and recommend the* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money orders.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the PRESS and Patent Circulars sent free.

DEWEY & CO.,

The Oakland Daily Transcript,

A BIT PAPER.

The Largest Circulation in the County.

Advertisements in the Transcript will reach every part of Alameda County.

RATES FOR ADVERTISING

VERY LOW.

A NEW PAPER
Will be published on SUNDAY NEXT, November 1st, to be called
THE SPIRITUAL LIGHT.
Published (for the present) Monthly.

It is especially designed to promote the cause of SPIRITUALISM, and assist in the discussion and investigation of all subjects pertinent thereto; which will naturally include Religion, Philosophy, Ethics, Morality and Universal Liberty.

TERMS OF SUBSCRIPTION.—One copy 1 year (invariably in advance) $1, Three copies to one address 1 year, $2 50. For convenience of remission, Greenbacks will (for the present) be received at $1 25 to the dollar in gold—we hope soon to be able to receive them at par.

TERMS OF ADVERTISING.—One square, one insertion, $1 (equal to 10 lines of ordinary brevier type); One square 3 months, $2; One square 1 year, $5; One column, 1 year, $25; do. 6 months, $15; do 3 months, $10

A copy will be sent gratuitously on application to the publisher, to all places where one cannot be seen at the Bookstores. Address GEO. C. W. MORGAN, Editor and Proprietor, 472 Harrison street, between Third and Fourth street; or, 1578 Post Office, San Francisco. 18v17t

OIL STOVES!

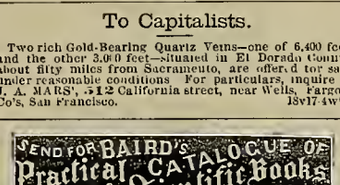
MORRILL'S
Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of $100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. R. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m



NOTICE.

TO ALL WHOM IT MAY CONCERN.—Notice is hereby given, that I am the first discoverer, first locator, and first Recorder of the Morey District, Nye County, Nevada, and I warn all persons from buying any interest in the said Morey mines until I prove my title to be perfect and lawful to said mines. THOS. J. BARNES.

Austin, Nev., Oct. 9, 1868. 16c17 1m

To Capitalists.

Two rich Gold-Bearing Quartz Veins—one of 6,400 feet, and the other 3,000 feet—situated in El Dorado County, about fifty miles from Sacramento, are offered for sale, under reasonable conditions. Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR NOVEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

Nov. 6th—CONSTITUTION.. .....Captain W. H. Hudson, Connecting with ALASKA, Capt. Gray.

November 14th—GOLDEN AGE.....Capt. W. F. Lapidge, Connecting with OCEAN QUEEN, Capt. Klug.

November 21st—COLORADO.....Capt E. S. Farnsworth, Connecting with HENRY CHAUNCEY, Capt. Connor.

November 30th—SACRAMENTO.....Capt. W. H Parker, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—it desired an amount of £40 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Boone, will be dispatched on SATURDAY, October 3d, at 12 o'clock M., from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge;* the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus debarring those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

Patent Rejections.

FIRST. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Steps Necessary to Procure a Patent.

The first thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the inventinn consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is ten weeks. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Candid Reasoning.

A gentleman eminent for his ability in all points pertaining to specifications, gives inventors the following sound advice:

To properly prepare a specification may seem a very simple and easy task, but such is not the case. It requires a knowledge of the arts, of science and scientific terms, and their proper use—of mechanics and the principles that govern their action—of law, and of the grammatical and legal force and construction of language, which is possessed by but very few persons.

Lawyers seldom possess the mechanical knowledge, while mechanics still more generally lack the legal knowledge necessary to enable them to properly prepare a case for examination.

It requires such a *combination* of legal and mechanical knowledge, together with a special knowledge of the principles and rules that govern the action of the office, that no person is really competent to undertake the business but those who *have made it a study, or had experience at it.* In view of these facts I unhesitatingly advise every person who has an invention worth patenting to get some responsible and competent agent to attend to it for him.

No person scarcely would think of entering upon a suit at law without employing a lawyer to attend to it, and make out his papers for him; and if a sensible man would not do that, much less would he attempt to prepare an application for a patent without knowing anything about the business.

I am aware that persons frequently attempt it, but I am also aware that *many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given when once rejected.*

Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their invention, and is therefore useless. It is for this reason that many applicants are compelled to reissue their patents at as great, and often greater expense, than the obtaining of the original.

Hence I repent, every person having an invention worth patenting should employ a competent and responsible agent—I say *competent and responsible,* for, unfortunately, there are many who are neither competent nor responsible.

If worth filing at all, these cases should be prepared with very great care and caution.

One intentor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented, or "Patent applied for."

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexations delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a SPECIALITY of legal jurisprudence; or, as Mr. Phillips, an eminent patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* and *experience.* As agents with such qualifications, we solicit honest patronage.

Re-Issues.

When, through "inadvertence, accident, or mistake," an *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can be cured by a *re-issue.* In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Illustrate your Innentiovs.

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

To Eastern Inventors.

Our close proximity to Mexico, Australia and the Islands enables us to obtain Letters Patent for you with much less *delay* and expense than they can be secured through any other agency in the United States.

Comparatively few inventors seem to be aware that Melbourne, in Australia, is a city nearly double in size to San Francisco, besides the adjacent colonies of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,
414 Clay Street, below Sansome, San Francisco.

SEPTEMBER, 1868.

ATTENTION.—Virginia City, Aug. 9th, 1868—Dewey & Co., San Francisco.—Gents:

The Patent, enclosing your favor with Inventor's certificate, etc., came duly to hand, and for which please accept my grateful acknowledgements.

I am pleased to learn that the business of your agency for Patents, etc., is rapidly increasing. This is as it should be. Your promptness, fidelity and skill, as Patent Agents, entitle you to public confidence and patronage.

I can see no good reason why Inventors on the Pacific Coast should employ agents in New York and other Eastern cities to transact their business at the Patent Office, when we have among us those equally qualified by long study and large experience.

Yours truly, J. A. C.

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

New Mining Advertisements.

Colorado Silver and Copper Mining Company, Arizona Territory.

NOTICE.—The Annual Meeting of Stockholders of the Colorado Silver and Copper Mining Company, of Arizona Territory, will be held at the Company's office, No. 713 Montgomery street, Room No. 40 (3d story), on MONDAY, DECEMBER TWENTY-EIGHTH, 1868, at 3 o'clock, P. M., for the election of Trustees and the transaction of such other business as may properly come before it.

nov14 B. W. MUDGE, Secretary.

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment (No. 26) levied on the fifth day of October, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No Certificate.	No. Shares.	Amount.
Carman, Wm	319	50	$50 00
Haley, Robert	323	10	10 00
Jordan, A H	342	25	25 00
Jordan, A H	343	25	25 00
Jordan, A H	397	10	10 00
Jordan, A H	398	10	10 00
Jordan, A H	399	5	5 00
Keenan, Wm	232	10	10 00
Kernan, Wm	279	8	8 00

And in accordance with law, and an order of the Board of Trustees, made on the fifth day of October, 1868 so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on the thirtieth day of November, 1868, at the hour of 12 o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.

Office, No. 28 Merchants' Exchange, south side of California street, between Montgomery and Sansome streets, San Francisco, California. no14

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that the Annual Meeting of the Shareholders of the above named Company will be held at the office of the Company, No. 426 Montgomery street, San Francisco, on THURSDAY, the twenty-sixth day of November, 1868, at 12 o'clock M., for the election of Trustees to serve for the ensuing year, and for the transaction of other business.

CHAS. F. SCHULZE, Secretary pro tem.

Office, 426 Montgomery street, San Francisco. no14

U. S. Grant Mining Company.—Location of Works: Carlisle, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of November, 1868, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 226 Clay street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the fifteenth day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the second day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ENOS TAYLOR, Secretary.

Office, No. 226 Clay street, San Francisco. nov14

Mining Notices--Continued.

Cordillera Silver Mining Company, Morelia District, Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of October, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.

Office, 321 Washington street, San Francisco. oc17

Chipionena Mining Company--District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of November, 1868, an assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. n7

Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty eighth day of October, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 40 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary.

Office, Room No. 40 Merchants' Exchange Building, California street, San Francisco. oc31

Fogus Mill and Mining Company.—Location of Works: Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of October, 1868, an assessment of two dollars and fifty cents ($2,50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office in San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twelfth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Washington Mining Company.—Location of Works: Nevada County, California.

The regular Annual Meeting of this Company will be held on SATURDAY, the SEVENTH DAY OF NOVEMBER, 1868, at one o'clock P. M., at the office of the Company, No. 318 Front street, San Francisco.

JOHN J. SCOTCHLER, Secretary.

San Francisco, Oct. 10, 1868. oc10

Machinery.

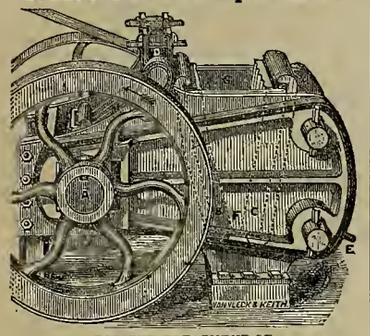
VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

HYDROSTATIC WORKS.

SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in the market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞ This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere. ☞ I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION PATENT
Variety Molding and Planing MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

21v16tf JOHN J. FULTON.

Two Rocks, Sonoma Co., Cal., Sept. 23, 1868.—Messrs DEWEY & Co:—On my arrival home, I found my Letters Patent all arranged to my entire satisfaction. Please accept my thanks for the energy, skill and dispatch with which you procured it for me. In future, should I require assistance in your line of business, I shall most certainly apply to you. Truly yours,

MICHAEL LAUFENBURGE.

Geology of the Gold Region of Nova Scotia.

An elaborate report by Dr. T. Sterry Hunt, F.R.S., addressed to Sir W. E. Logan, F.R.S., director of the Geological Survey of Canada, upon the Gold Region of Nova Scotia, has just been printed by order of the local House of Commons. The rocks of this region consist chiefly of slates and quartzites; they are, however, cut in many places by intrusive granites, and in addition to these several small areas of gneissic rocks occur in different parts of the belt, but their true relations to the great mass of strata are not yet clearly made out. Leaving these aside, the rocks which cover the principal part of the area under consideration are, by Mr. Campbell, divided into the quartzite group and a clay-slate group, the latter conformably overlying the quartzites, and the two constituting one gold-bearing series; the total measured thickness of these two divisions is, according to the same authority, nearly two miles; but the gold appears to be chiefly confined to the quartzite and the lower portions of the clay-slate division. The geological age of these rocks is uncertain; although comparatively little altered, they are without fossils, as far as yet known, and are very unlike the fossiliferous Upper Silurian and Devonian rocks met with in other parts of the province; at the same time, the high antiquity of the gold-bearing strata is shown by the fact that the carboniferous system rests upon their upturned edges, and is partly formed from their ruins. The rocks of the gold series are affected by undulatious running east and west, which have raised the strata to high angles, often approaching the vertical. According to Mr. Campbell there are not less than six principal anticlinals exhibited on a transverse line of section, extending from the sea-shore at the southeast entrance to Halifax Harbor, northward to the Renfrew gold district, a distance of about thirty-five miles. The direction of these nearly parallel anticlinals is about east and west; but to the westward they bend toward the south, and to the eastward in like manner disappear beneath the sea, between Cape Canseau and Liscombe Harbor, with a strike, E. 30° S. In addition to the great east and west folds, the gold series is affected by a second series of more gentle undulations, having a north and south direction, and producing transverse anticliuals, on the crowns of which the gold-bearing portions of the series are brought to the surface, while they are concealed not only in the great east and west synclinals, but also in the north and south cynclinals, where these traverse the east and west anticlinals. The total thickness of the series, as already stated, is estimated at about two miles. As far as yet observed, the gold is confined to the quartzite and the lowest portions of the overlying clay-slates. The gold mines of Nova Scotia belongs to the Crown; and the law of May 10, 1864, regulates all questions as to the concession and working. In concluding his report Dr. T. Sterry Hunt remarks that it may well excite surprise that so little mining has yet been done in Nova Scotia, where gold is known to be spread over an area of not less than 6,000 square miles, and where, notwithstanding the want of skill of the early adventurers and the lack of capital, such remarkable results have already been obtained. The lodes in this region, which are very regular in structure, have been shown to preserve their richness to depths of 200 and 300 feet, and from their geological relations there is every reason to believe will continue unchanged to the greatest attainable depths. To this it may be added that the price of labor is moderate, not exceeding $1.25 a day; fuel, both wood and coal cheap and abundant; the region healthful, and easily accessible from abroad. When all these things are taken into consideration, it would appear that no other gold mining region offers such inducements to the introduction of capital and skilled labor, and that these alone are required to make Nova Scotia one of the great gold-producing regions of the world.

JOCUM VALLEY.—A correspondent of the San Diego *Union* writes: "There are several settlements in this vicinity, mostly emigrants from the States. Some families have recently moved in from Texas and settled here. Some have located in the vacant valleys, while others have bought places with some little improvements on them.

POST OFFICE MANAGEMENT.—The official organ of the North German Post Office Department says that in no civilized country in the world is the post office business carried on so loosely and recklessly as in the United States.

A New Treatise on Concentration of All Kinds of Ores.

INCLUDING THE CHLORINATION PROCESS FOR Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally, by GUIDO KUSTEL, M. E. & M., author of Nevada and California Processes of Silver and Gold Extraction—120 lithographic diagrams.

OPINIONS OF THE PRESS.

KUSTEL'S NEW WORK.—Mr. Guido Kustel has just put forth another volume, a copy of which we have received from the publishers, Dewey & Co., San Francisco. The book contains 120 diagrams on seven plates. In issuing the work, the design of the author appears to have been to exhibit the present state of the art of concentrating ores as practiced in the older and more experienced mining sections of the world, as well as in the more recent mining operations in California. The principles on which the system of concentration is founded are stated without entering into scientific reasons.

The dressing of ores is treated at great length, and the plan is based on these principles: "1st. Each constituent of the mass of ore must be brought to the highest value which can advantageously be given to it. 2d. The useful minerals must be concentrated only to the most advantageous degree of purity; and, 3d. All loss of the quantity and value of the useful mineral must be avoided as far as practicable." Reduction in its diversified modes—by rock-breakers, stamps, rolling mills, and grinding in arastras, pulverizers, Chili mills and pans—necessarily occupies large space by reason of its importance.

The plan of reducing ores by stamps, in either the wet or dry process, forms a complete treatise of itself, and may be studied with advantage by all persons connected with reduction works of that character. Concentration of gold ores is specially treated in section 49, and of silver ores in section 50. The latter subject should possess interest for our millmen and miners, as the plan of concentrating ores is certain to be resorted to as soon as the business is understood and reduced to a system.

The sections of the work devoted to the extraction of gold from sulphurets, arseniurets, or quartz, by chlorination, are based on Plattner's process of the property of chlorine gas to transform metallic gold into soluble chloride of gold. By this process it has been demonstrated that gold is extracted perfectly. Our author says the process was first introduced into Nevada, California, in 1858, where there are several establishments in successful operation.

The process of chlorination is described in the fullest manner, and embraces a particular description of the various roasting furnaces in use, as well as of the operation of roasting.

We commend Mr. Kustel's treatise to the attention of all concerned in the business of mining and reducing ores, to whom it must prove a valuable hand-book of practical knowledge.—*Daily Reese River Reveille, Jan.*, 1868.

Price of the work, $7.50. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS, San Francisco, who will supply orders, by mail or express, at wholesale or retail.

CURRENCY TABLE.

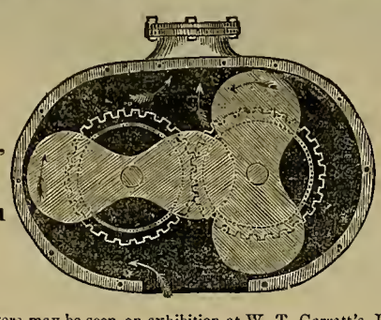
HARD RUBBER WAGONS.—The American Hard Rubber Vehicle Company have on exhibition at 27 Murray street, New York city, a whalebone rubber road wagon. The body, including the seat and dash-board, is cast in one piece. The surface is highly polished, cannot be easily scratched or stained by mud, and its inventors claim that it is stronger, lighter, and fifty per cent. cheaper than those made of wood.

A CONVENTION of gas manufacturers and engineers is to be held in New York or Philadelphia this fall



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR **Smelting, Foundry, Mining and Steamships.**

REQUIRES **Fifty Per Cent.** LESS POWER **Than any Blower** Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

JOHN PERRY,
MANUFACTURER OF
Cocoanut Matting, Rugs, Mats, Etc.
And Cocoanut Fiber for Upholstery.
South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely free in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

BUERK'S
Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada as about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast,

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 284.—Bog iron ore—hydrated oxide—from Sulphur Springs, Summit Valley, near the Pacific Railroad. Thomas McGee.

No. 285.—Galena, with a thick coating of red oxide of lead—minium, cystalline; from the Marguerita Mine, Arizona. Prof. Price.

No. 286.—Auriferious pyrites and lead sulphuret ore, from the Petticoat Mine, Railroad Flat, Calaveras county; working $80 to the ton. G. W. Hopkins.

No. 287.—Wood tin, from Durango, Mexico. Mr. Bennett, of Santa Clara.

No. 288.—Samples from the Virginia Mine, near Coulterville, Mariposa county, auriferous pyrites. Capt. Aiken.

THE CORNELL UNIVERSITY promises in its endowment, organization, and list of professors, to be the leading educational institution of the Union. It is a valuable feature connected with it that facilities are offered to students to earn sufficient to defray their expenses, by working in the field or in the machine shop.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

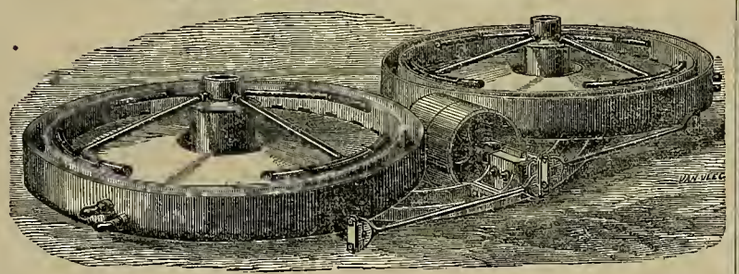
SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.



The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE, STEPHENS & HARRY.
13v16eow

HUNGERFORD'S IMPROVED CONCENTRATOR,
For Saving Gold, Sulphurets, Quicksilver, etc.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oncida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lamburd to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—Dear Sir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,
GODDARD & CO., San Francisco.
Or M. HUNGERFORD, at the Pacific Iron Works.

About the Pacific Railroad—The Builders and the Country.

The great event of the year in our field,—the building of the Pacific Railroad across Nevada,—demands attention from us, which we bestow with great satisfaction. Everybody has learned, by frequent reports in the newspapers, what force of white men and Chinamen the great railroad column from the Pacific is composed of; how great a pressure there has been to get the iron and other constructing material pushed on to the front as fast as it was required; how many miles east of Sacramento or of Reno, or some undefined geographical locality the terminus of the road was located at last accounts, under a certain rate of progress per day, if and provided the governing circumstances at the time did not disjoint things; and at what time next year Messrs. Crocker and Durant should strike hands, if they did not give each other the cold shoulder entirely. in Brigham Young's country, and run along to Missouri and to California respectively, from mere impetus or excitement in the great work. But where the oft-repeated names of railroad towns are to be located in our mental geography—how far east so many miles from Sacramento would be, and what kind of a country it is that we shall find presently opened up to our astonished view—there appeared to be no means of definitely ascertaining. The accompanying map, with the table of stations and distances made use of by the officers and employés of the Central Pacific Railroad Co. are furnished with the hope that our readers may derive such definite information in regard to the opening up of the great argentiferous interior as they may require to enable them to comprehend the situation.

The road is completed and in running order to Argenta, but it is graded and may be considered completed to Humboldt (12 mile) Cañon, or even to Humboldt Wells, on the other side of the Cañon. While during the winter the principal business terminus will be Argenta, it is thought that if the snows come lightly the whole road may be completed to Salt Lake, by January. There were on the 1st of November 440 miles of track to be laid yet, to complete the entire Pacific Railroad; of which 230 fell to the Central Pacific, and 210 to the Union Pacific Railroad Company. Construction trains on the building end of the Central Pacific, are designed to be kept constantly from 70 to 100 miles ahead of the terminus. Nearer than that we are unable to specify how far our end of the road may at this instant be pronounced actually "finished."

Not the least interesting feature in connection with the great railroad building is the engineering *personnel*,—the character of the men who are directing this historically picturesque army of laborers. Manly energy, sometimes possessed to an extraordinary degree, is the characteristic of every one of the engineers with whom we have had the pleasure of becoming acquainted; and the tone of the majority is such as would be derived from an ample experience in rough adventures, over no limited portions of the world, and of self-developed mental culture, according to the bent of the individual. We are not able to mention the names in full, but the following list will embrace most of them:

NAMES OF THE PRINCIPAL EMPLOYEES.

Chief Engineer—S. S. Montague.

Principal Assistants—Charles Cadwalader, in charge of the line this side of Humboldt Wells; Mr. Clement (also Chief Engineer of the Western Pacific R. R.) in charge of the line between Humboldt Wells and Salt Lake. Mr. Clement has gained the reputation of being a splendid engineer, a fact which was accidentally discovered by Mr Montague while he was employed in a subordinate position for which he had offered himself, no one having been made aware of his antecedents.

REFERENCES—1, Reno. 2, Wadsworth. 3, Maags. 4, Brown's. 5, Granite Point, or Pump Handle. 6, Lovelock's. 7, Oreana. 8, Humboldt City. 9, Mill City. 10, Raspberry Cañon. 11, Winnemucca. 12, Emigrant Cañon. 13, Reese River and Sink. 14, Argenta. 15, Humboldt Cañon. 16, Humboldt Wells. 19, Hunter's. 20, Crystal Peak. 25, Black Rock and Mud Lakes. 28, Belmont. 29, Hamilton. 30, Shermantown. 31, Pyramid Lake. 33, Carson Sink. 34, Goshoot Lake. 35, Aurora. 36, Humboldt Desert and Humboldt Lakes.

Consulting Engineer—George C. Gray, formerly of the New York Central R. R.

Locating Engineers—The pioneers who have been engaged in making the preliminary surveys and locations: Butler Ives, formerly Commissioner of the California and Nevada Boundary Survey; and Messrs. Bates, Phelps, Slade, McCloud, Lawton, and Stevenson; the last two having been engaged part of the time on the Western Pacific.

Constructing Engineers—Wm. Hood, H. Root, Robt. Finley, Col. R. E. Patten, formerly of the U. S. Engineer Corps, a well known and very competent engineer; Mr. Graham, and W. B. Treadwell, the latter having been connected with railroads in the Western States.

Engineers in charge of the track-laying.—Mr. Haslett, the author of Haslett's Engineering, formerly connected in some way with Columbia College; and Edward Mix.

Under the immediate authority of the Contractor, Charles Crocker, who is really the builder of the road, though the work is in his hands in the form of a contract at so much per mile throughout, is the

Superintendent of Construction—J. H. Strobridge, the actual manager and builder who "runs the whole concern,"—a very energetic man, and necessarily an important personage.

The Superintendent of Track-laying, under the contractor, is Mr. Minkler. Besides which there are, under Mr. Strobridge, known popularly if not elegantly, for want of a better designation, as

"*Riding Bosses*"—Messrs. J. B. Harris, Wm. Gray, Frank Freytas, and Michael Stanton.

THE KIND OF COUNTRY.

Beyond Reno the country soon becomes treeless, though not entirely barren, until after leaving the Truckee at Wadsworth to continue its course northward to Pyramid Lake, the traveler comes in sight of Humboldt Desert, which is remarkable and will become famous for its mirages, indicated by the name given to one of the stations. It is forty miles across. Thence to Winnemucca (11) the soil answers tolerably well for raising vegetables. At Raspberry Cañon (10), right in the alkali soil, they have been raising some of the best barley in the world; and vegetables enough were produced by a wide awake Teuton who went there and planted in season last Spring, to supply the entire railroad corps. On the Humboldt Meadows excellent grain of all kinds is raised. Paradise Valley, northeast of Winnemucca, is already transformed into a valuable farming country.—Thence on to Humboldt cañon the agricultural capabilities are good, the bottoms being covered with luxuriant grass, of which a great deal has been cut during the past season. The water from Reno to Gravelly Ford, (just this side of Humboldt cañon) is not good, being strongly impregnated with mineral matter. At Gravelly Ford, however, the country is pleasant, and the water good. Humboldt cañon is very narrow and precipitous. Beyond it, the soil and climate are excellent for farming, and it is settled by Mormons who have ranches all along from Humboldt Wells to the north end of Salt Lake.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Mining in Sierra County.

HOWLAND FLAT GRAVEL MINES.

Here are the Union, Hawkeye, Pittshnrg, Monumental, Empire, Virginia, Down East, French, Sugar Loaf, and other companies.

The leading company is the Union, which is 2,000 feet in frontage, and 3,400 feet long towards the hill, Table Rock. On the east side of the Union is the Hawkeye Company, 800 feet in front, 3,000 feet long; the Pittshurg, 800 feet front, 2,500 feet long; the Monumental, 1,200 feet front, 2,000 feet long; Empire, 1,200 feet front, 2,000 feet long; Virginia, 800 feet front, and 2,000 feet long. On the other side of Table Rock, on the south, running the tnnnel towards the works of the Union Company, is situated in Gold Cañon the Sierra Company, and the Fashion Company, each about 800 feet front and 3,500 feet long. The old river bed, on which all these companies are working, is to all appearance running from N.E. to S.W., and the bottom of the same lies very deep, so much deeper than Howland Flat, that it would require very long and deep started tunnels for drainage, in case these gravel mines shonld be washed as at San Juan, Smartsville, Timhuctoo, Cherokee Flat, or like diggings. But the main reason for working these mines around Howland Flat by drifting, is the scarcity of water, which could only be brought in from Gold Lake, under a very heavy expense. Now the different companies have, from springs in the neighhorhood, water collected in reservoirs, sufficient to wash their drift dirt.

The Union Company is working in the most extensive style of any company around here, and perhaps of any other gravel mine worked by drifts; and a particular description of this mine and the style of working the same, will be enough said in regard to these mines in general. The work which opened this mine was commenced in the spring of 1857. The same is 352 feet, at an angle of 24 degrees, and is prolonged by a tunnel following the rise of the bedrock. This tunnel is in about 3,500 feet, and to both sides a great many side drifts are made. Another tunnel is started from the stope towards the Hawkeye ground, now about 800 feet in, which will open new ground to he worked in about five or six years. A third tunnel will be started from the stope, nearly at a right angle with the last mentioned tunnel, which will in time become the main work tunnel. From 5 to 15 feet above the 3,500 feet long tunnel, an air tunnel is run, which ventilates the mine very well. This tunnel was more practical than raising air shafts to the surface, as the top and the sides of the Table Rock is covered with a very thick layer of lava and basalt. For timbering the mine, all sizes are used; for breasting, from 3 to 7 feet long; for spilings, 4½x5 feet long; round timber for posts, 6 to 7 feet in length; for caps, 5 to 9 feet long. In the new tunnel, called Broadway, timber is used for posts 6½ feet, and for caps 7½ feet, of a diameter from one foot to 20 inches. The gronnd needs very careful timhering, as the bedrock is swelling. The repair and retimbering of the tunnel which is now used as a main working tunnel, is so expensive that the company prefers to run the new tunnels as above mentioned.

In former times the company used steam power to hoist the gravel, but the expenses were too large, and the danger of fire was great, as during a great part of the year strong winds are hlowing here, so that the company have made arrangements for using water for hoisting in place of steam. This is a very cheap and a very conveniently arranged way of working. Tho water is carried in pipes from a reservoir, and has a perpendicular pressure of 124 feet, being brought on to a Fredenhurgh's patent wheel, 24 feet diameter, which moves a large drum ou which two wire ropes are running, hoisting one car and lowering at the same time another one on the double track of the slope. After the water is used for hoisting, it is discharged into a large reservoir from whence it is used for washing the dirt. This is done in front, and in proportion helow the slope on a platform, as usually used for this purpose. This place is covered hy a large house, which incloses the hoisting works and hlacksmith shop. The sluices are 1,200 feet long, which contain slat riffles covered with iron, and at the lower end old car wheels are used to a very great advantage. At the ahove mentioned reservoir, pipes and arrangements are attached to extinguish fire, which could hreak out in any of the surrounding houses, where a large amount of timber is stored. The company works on an average 75 men, sometimes as many as 100, paying from $3 to $3½ por day. The amount of hlne gravel hoisted last year, was 102,112 car loads (a car load containing one ton), at a total expense of $83,425. The total yield was $123,882.13, which left a surplus of $40,457. The deposit of this old river channel is mostly quartz gravel very little intermixed with slate. The gold is undoubtedly quartz gold, very frequently showing particles of quartz attached to it; some of the quartz boulders showing also free gold, and some showing considerable snlphurets. The mass of sulphurets, which appear hroken up in the gravel, seems to be rich, but the company has until now saved none of them. They will do it hereafter, as I pointed out to them the manner of saving the same, and having them worked. The deposit of hlue gravel is not high, and in no place, until now, has it heen found on the bedrock higher than 4 feet 8 inches, heing covered with a layer of fine sand 10 to 40 feet high, and this sand again is covered with a very extensive layer of pipe clay, intermixed with strata of sand. The Union Company has its own sawmill, water privileges, timher land, and reservoirs.

All other companies around here work on smaller scale, although they have rich ground. Here a very large field is left for working, as most of the surrounding hills contain gravel. The channel is, to all appearance, running from N.E. to S.W., and prohahly split hy Tahle Rock, one channel passing along Howland Flat, the other running along Cold Cañon, down to Poker Flat, and from there to Morristown. Nearly opposite Howland Flat is another channel, opened at Gihsonville, and higher up at Whisky Diggings. These channels go into Plumas County, but are there not opened. Here in Sierra Connty, wheresover deep ravines cut these channels, rich surface and river diggings are found, hut these places are mostly left to Chinamen, as white men consider them worked out. Wherever here in Sierra County large deposits of lava and hasalt are found, almost all these places show underlying deposits of gravel. Should this not bo a good gnide for hydraulic mines? In such a case, Clover Valley, and other placcs in Plumas County, shonld have good gravel diggings. Sierra County has proved, since the discovery of gold fields, one of the richest, if not the richest field for mining, and it still is plainly visible that all these old river channels crossing this county are only opeued and worked in comparatively few places. Capital is needed, but this only can he expected to come in after the railroad is finished, for then eastern capitalists will be induced to look at the mines for their own advantage.

THE EUREKA MINE,

John Parrott & Co., proprietors. This mine like so many discovered and first worked hy Mexicaus in their preferred style of grinding quartz in arastras, had iu former times two arastras running. The mine is situated on the north side of Jamisson Creek, in Plumas County, near to the line of Sierra County. The ledge is running along the hillside about 1,800 feet above Jamisson Creek, runs from northeast ot southwest, and crosses the creek and runs towards the Sierra Buttes, and is prohably one of the ledges on which the Sicrra Buttes Company is located; judging from the texture of the quartz and the sulphurets, it might be the Rose ledge, the richest of the veins on which the Sierra Buttes Company is working. The Eureka changed hands at different times, all the former companies having had incompetent managers, it is alleged. After the property came into the hands of John Parrott, a different stylo of working was adopted, under the superintendenco of H. L. Leightner. This gentleman has succeeded since last spring in shipping hullion to the amount of $80,000—in less than six months time, and the new openings which are made guarantee for the next year results of double that amount. This season was too short to finish the arrangements of supplying the two mills with sufficient water to work through the winter, and cousequently the mills were closed np last week, to remain standing idle until next spring. But at the mine work will be coutinued through the winter by thirty men, who will take out quartz. Since this spring the company opened new parts of the ledge and found rich quartz, averaging from $15 to $20 per ton. The company owns two mills, of 20 and 16 stamps, and one sawmill. The next claim is the Seventy-Six, located on the same ledge, but for the present not worked, in consequence of an injunction. This part of the ledge appears to be richer than the Eureka claim, hut the works are started considerahly higher up than those, and all the quartz was packed on mules over a very bad trail. The next claim on the same ledge is the Rough & Ready, belonging to John Parrott. Only prospecting work is doue, although the ground would afford a good opportunity to open up the entire ledge in the hest style, as the vein runs along the hillside, crossing Jamission Creek, where a deep tunnel could he run on to the ledge, which would give over 2,000 feet of backs. At this point on Jamisson Creek, mills could be erected and worked by water power, to run 100 stamps and more.

On the other side, northeast of the Eureka mine, are the Mammoth mine and mill. The works on the ledge are started too high, and in consequence the ledge is found hroken up, still showing in places very rich ore. The company finished a long railroad track on the side of the hill leading down to their mill, which is situated on Jamisson Creek, and a few days ago the mill was started. Surface mining on Jamisson Creek is very limited now; the places are worked out, hut paid very rich in former times. All the gold found in the creek is quartz gold, and not washed, and came uudoubtedly from the Eureka ledge and the surrounding claims.

F. B. S.

Enterprises and Developments.

Steamboat Communications are no longer a matter of experiment on the Colorado. A new stern-wheel steamer named the Chindu-Wan has been built at Stockton hy Mr. Davis, expressly for the Colorado river, under the superintendence of her present commander, Capt. R. T. Rodgers, who took the first boat up the Colorado river as high as Callville. Chindu-Wan is an Indian name and signifies "leader," or pilot.

On the Columbia steamers are now running regularly almost to the head-waters; up Snake river (the Idaho branch) as well as up the northern branch to the confines of British Columbia; the former having been put on by the Columbia River Steam Navigation Company, and the latter by private enterprise.

On the eastern side of the Rocky Mountains a lot of St. Louis stern-wheel hoats make regular trips to the foot of the mountains, and on the Saskatchewan occasional trips are made from Lake Winnipeg, in small steamers carrying Hudson Bay Company's freight.

As an example of the unprecedented development of our western slope within a few years, even independently of mining, we may single out harharous "Walla-Walla," that *Ultima Thule* of the days of Olney's Geography, which was then about the only place marked ou the river; it is now a center of 8,000 inhabitants,—a fact which even Californiaus can scarcely realize. Coastwise aud trans-oceauic steamers go everywhere—to every place that can offer any attractions for a visit from the "man of destiuy."

Tamalpais Lumbering Company.—A joiut stock company has beon formed uuder the leadership of well known names, which are recognizable "iu everthing," for the purpose of hringing to market "the redwoods" ou Shafter's Ranch, northwest of Tamalpais. A railroad is to he built, from the timbered section, via Lagunitas Creek to California City on Richardson's Bay, opposite the ferry landing at Saucelito, and nearly as close as that to San Francisco; the line having been surveyed some time ago, but left in *statu quo* for further developments. We understand that the Shafter Brothers retain an interest in the enterprise.

The following interesting items are extracted from the S. F. *Real Estate Review*:

The Salinas and Pajaro Turnpike Road Company has been temporarily organized, and will soon begin the construction of a road from Castroville to a point on the north sido of Elkhorn Slough, counecting with the public road which leads from there to Watsonville. * * * A contract has heeu made for boring an artesian well in Dry Creek Valley, Fresno County, and, if necessary, the boring will go to the depth of a thousand feet. * * * There are about 238 acres of tohacco growing in the neighborhood of Gilroy, and the owners expect to put 300,000 pounds this year. * * * A large tract of land near the foot of Second street, the sale of which to F. B. Tichenor, was mentioned in the papers some few days ago, is said to have been bought by that geutleman for the San Francisco and Alameda Railroad Company, with a view of running their boats across to that poiut, which is about the same distance from Encinal as the Pacific street wharf is from Oakland. * * * Six months ago the site of Salinas City was surveyed and the first lot sold. Then the city consisted of a dilapidated hotel and one store; to-day it hoasts of eighty substantial buildings, and among them a store of metropolitan proportions. * * * At San Diego the olive has long been one of the regular products of the soil, and has been cultivated to some extent for pickling. But of late, ranchmen are heginning to turn their attontion to the making of oil. A Mr. Sanborn, of San Diego, has 400 trees, and expects to make a considerable quantity of olive oil for exportation.

Proposed Road from Susanville to Surprise Valley.—Z. N. Spalding, foreman of a road party, reports in the Lassen *Sage Brush:*

We have succeeded in finding a practicablo route from Susanville to Surprise Valley, and one which will comprise a distance of not more than 60 miles. The route as proposed by us will be by way of Horse Lane and Red Rock, entering Surprise Valley at or near its southwest corner. The hill hetween Susanville and Willow Creek is the steepest on the entire line. Very little grading will he required, and, in fact, teams could now pass over it almost, if not quite, as easily as over the Smoke Creek route. Grass and water abound ahundantly. The longest stretch between watering places is only a distance of seven miles. On our return from Surprise Valley we made the trip with a four horse team in about three days. The major part of the labor in making this road will consist in throwing the rock out of the proposed track; this done, and all the travel will go this way all the timo in preference to any other route. What the expenses of a first class road will he is hard now to determine, but we are convinced that three weeks labor on each end of the road with ten men wonld cause the ahandonment of every other route into Surprise Valley. We therefore recommend this route as a very excellent one, and advise immediate action in its construction.

The same country will be found further described in the Boundary Survey Report, written by James S. Lawson, and published at Sacramento in 1864. This is a valuable section, having plenty of water, grass, and timber, on the horders of the barren mining country of Nevada.

Wood Working at Salt Lake.—The Deseret Steam Woodworking Company have commenced operations at their new shops, one hlock west of the Tabernacle, Salt Lake. The machinery is of the finest make, and with it the country can turn out surfaced lumher and tongued and grooved flooring in any quantity with dispatch.

Susool Branch Railroad Project.—A company has heen incorporated to build a road from Suscol across to the Saucelito and Humboldt Railroad, below Lakeville, a distance of about twenty miles, most of the way across the tules. When the southern part of the Humboldt Railroad is finished, this junction line will furnish a convenient method of reaching Sacramento and the interior from this city, as the distance will be shorter than hy the Western Pacific route.—*Alta.*

The San Diego *Union* advocates the establishment of an intelligence office iu that town.

Mechanical.

TEMPERING OF HARDENED STEEL.—The following is from Landrin's new treatise on steel: The colors, during the tempering, are a sure guide for the workman, of the degree of hardness or tenacity he desires to obtain. Dark blue indicates a great tenacity, straw yellow produces a greater hardness, and is the tempering shade for razors. Bistouries, lancets, penknives, erasing knives, some scissors, and generally blades requiring body, are reheated to full yellow. The strong blades for table knives and gardening tools are tempered to a brown or a purple brown. Purple is the proper color for large shears. Violet and dark blue are for springs; with a violet color, the spring will be very elastic but brittle, a blue shade will make it very resisting. It is very difficult to break a spring reheated to the color of water; but its elasticity is a great deal lessened.

"UNWEAVING" RAGS.—The saving of the fiber of silk or other rags for future spinning, has been repeatedly experimented upon without success. The mode most in use of utilizing these waste fabrics has been that of grinding them to "flock" to be mixed with new material for the making of "shoddy." The *Mechanics' Magazine* for Sept. 11th, describes a new, very ingenious, and very simple apparatus for "*unweaving*" these rags. It not only preserves intact the fiber, but it is also completely effective in separating for use the threads of such fabrics as are woven of silk or wool upon a cotton weft. It consists merely of an endless brush, which travels underneath a revolving roller furnished with pins. This roller combs out the threads, and is cleared of them by another roller above, which has a brush surface.

NEW ROCK-DRILLING MACHINE.—The *Scientific American* has seen a drilling machine recently invented by a Vermouter, which will make a smooth one and a-half inch hole "in extremely hard rock" at the rate of one inch per minute. It is thus described: The machine consists of an upright boiler, with an oscillating steam cylinder attached which drives the drill, and a pump which constantly forces a stream of water into the bore-hole. The drill is a short hollow cylinder of iron armed with diamonds placed on the lower end, which is serrated, to form seats for diamonds. This tool is fixed to a hollow tube of iron to which two gears are attached, connecting with the primary gear, which is driven by the steam cylinder. The upper and lower gear give, by the ordinary adjustment, reverse motion to the tube. The water is forced through the tube by the pump and effectually clears the bore-hole of detritus. The cutting is done in a circle, by the revolution of the tool, and a ping is left which passes up through the tube as the latter descends, leaving, however, sufficient room for the descent of the water. This plug or cylinder of rock is easily broken off and removed, and is in many cases valuable, as it is always a good specimen of the rock through which the boring is done.

HEAVY LOCOMOTIVES.—The general adoption of steel rails in place of those of iron, which it now seems probable will ultimately take place, will bring into use locomotives of much greater weight than are now desirable. *Engineering* says: It would afford a good exercise to many young engineers to set about designing six-coupled engines of a weight of 50 tons or thereabouts and having this weight equally distributed. The cylinders would require to be from 20 to 21 inches in diameter, for two feet stroke and five feet wheels, and the boiler should not have less than 1,800 square feet of surface, and 30 square feet of fire grate.

THE FRENCH ATLANTIC CABLE.—The manufacture of this cable has been commenced. The Great Eastern is to be moored, and fitted up as for her former cable-laying; and the cable will probably be stowed in her tanks as fast as finished.

CRYSTALLIZED TIN-FOIL.—Puscher, of Nurnberg, gives the following process for obtaining a crystallized surface upon tin-foil, used for various ornamental purposes:

A solution is made by dissolving two parts of chloride of tin in four parts of hot water, and to this is added one part of nitric acid and two parts of hydro-chloric acid. The foil is to be dipped into this mixture and left until the crystals appear; but it answers very well to brush the foil over with the liquid. In either case, as soon as the crystals appear, the foil must be rinsed with cold water. It will do to sponge the surface well with a soft sponge and plenty of water. When the solution is applied to cold foil the crystals are small, but very brilliant. Large crystals can be procured by heating the tin-foil on a hot plate, and brushing on the solution when the melting point is nearly reached. This solution may be used as a test for the purity of tin, inasmuch as tin containing only one per cent. of lead or copper will not give a crystallized surface.

BORING FOR COAL.—The rods are usually in 10-feet lengths, 1¼ inch square iron. The borings are usually made from two inches to twelve inches diameter with the ordinary tools—augers and chisels of various kinds. From twelve inches to eight feet the borings are made with a "miser," which is a wrought iron instrument, with a strong halfing joint at top. For a 12-inch boring the "miser" is made twelve inches diameter, and twelve inches high; it has a conical bottom, with a valve covering a small portion of the bottom; when the valve is opened, one edge of the opening acts as a cutter, scooping the material into the inside as the "miser" is turned round; when full it is drawn up to the top. In borings of large size and great depth steam-power is applied, with winding gear, jumping beam, and a high wooden framework, which facilitate the drawing and letting down the rods, and effect a great saving in time and cost,—very important matters in boring. Where the stratum is soft, and the bore-hole requires lining, wrought iron pipes are inserted with screwed ends, peculiarly made for borings, as they have no projections inside or out, and can be more easily forced down the holes. When these pipes can not be driven further, it is necessary to insert other pipes inside them, thus reducing the size of the boring, and increasing the cost.—"*La Honille*," *Coll. Guardian.*

AN ENDLESS CHAIN.—An English coal company,—the West Staveley,—has had constructed an endless chain three miles long, and weighing twenty-six tons, for the purpose of conveying coal by means of cars over hilly ground, from the pit to their colliery,—a distance of one mile and a half. It travels,—says the *Colliery Guardian*,—at the rate of two miles an hour over the ground, but is capable of being worked at the rate of six miles.

IMPROVEMENT IN BLAST FURNACES.—An English inventor has obtained "provisional protection" for certain improvements in blast furnaces, one of which consists in contracting the blast furnace at one or more elevations, whereby a support is afforded to the superincumbent mass, which prevents an undue pressure on the materials in the lower part thereof, and thus avoids a dense mass through which the air has to be forced.

GLAZED WATER-WHEEL.—A new wheel has been patented by an inventor in Troy, N. Y., which has its surface *enamelled*, to diminish the friction of the water upon it, and,—in the case of iron wheels,—to prevent oxidation. The substance used for the purpose is not mentioned in the notice which we have seen of the invention.

IMMENSE ROPE CABLES.—Three of the largest cables ever made have just been completed at the Chatham Dockyard, England. They are to be used for towing the new monster iron dock to Bermuda. Each is 26 inches in circumference, is 101 fathoms in length, and weighs seven tons.

CHILLED RAILS.—Rails with chilled surfaces,—produced by bringing water in contact with them when coming from the rolling-mill,—are talked of in England.

Scientific Miscellany.

Rust in Wheat.

The Commissioners appointed by the Governor of South Australia to inquire into the nature and causes of the rust, have collected several contradictory experiences of wheat growers. One finds that it occurs on newly cultivated land; another sees it only on exhausted soil. One thinks it is caused by manuring; another that it is prevented by it. One sows early, and it occurs; another late, with a like result. One says white straw is the best; another recommends the purple straw. The *Mark Lane Express* says: "There is no doubt that climatic conditions have the greatest share in the production of the red rust. A moist, warm season causes a florid development of vegetation, and opens the breathing pores of the plant, and so gives passage to the spores of the parasites which are continually held suspended in the air. These, entering the openings, throw out their rootlets, and, intercepting the sap between the stem and the ear, impoverish the grain and destroy the crop. Dr. Muecke is of the opinion that the red rust never attacks the wheat plant unless it is otherwise diseased. The following case is instanced by him. Part of a field of wheat, in which wild oats had prevented the wheat from growing, was cut for hay. Immediately the wheat sprung up healthy and vigorous, and developed full ears and fully grown grains; not a particle of rust was perceptible on this part of the field, whilst the surrounding thick and high wheat was completely covered with it. The cause assigned is, that the wheat did not grow till the time was passed in which the influences supervened that predisposed the plants to disease. While the spores passed over them they were not infected, because the spores did not find the conditions of their existence—that is, diseased sap and weak cells—upon them."

GEOLOGICAL APPLICATIONS OF PHOTOGRAPHY.—Mr. James Thomson, of Glasgow, saws thin plates from translucent fossil corals, polishes them in the manner described in the PRESS some time since as recommended and practiced by David Forbes, F.G.S., and then prints from them by means of photography. He has made upwards of two thousand such sections, and has undertaken to prepare a duplicate set for the British Museum. He has been working at the subject for seven years. It is a process requiring the most delicate care; for the cut must be so made as to exhibit the internal structure of the extinct organisms of which the coral is composed. One touch too much will spoil the specimen. Mr. F. has been occupied for ten hours in finishing a single section. He has had transparencies and micro-photographs also taken from these stone negatives.

ARTIFICIAL MAGNETIC OXIDE OF IRON.—Mr. Sidot introduces a small platinum disk, filled with colcotbar, into a porcelain tube, situated in a direction parallel to that of a dipping needle. After keeping the tube at a temperature a little below a white heat for about an hour, the colcotbar will be found transformed into a grayish metallic oxide, the particles of which are strongly agglomerated together. This mass possesses the property of polar magnetism.

ACTINOMETER.—A new actinometer has been introduced by Dr. Vogel, which is so arranged as to expose sensitive paper to light under a ladder formed by layers of paper resisting in varying and regular degrees the action of the light, and each one being indicated by its particular number. The instrument is used in a kind of frame or box resembling an ordinary printing frame, but opening at the side.

ALTERNATE ELEVATION AND SUBSIDENCE OF THE LAND.—At a recent meeting of the British Association for the Advancement of Science, Rev. John Gunn read a paper upon this subject. After referring to the post-glacial and middle drift deposits, he called attention to the forest bed and the laminated beds found thereon, as exhibiting in a striking manner the results of alternate elevations and depressions. This forest bed was formed, at least in part, in a basin of chalk covered with a bed of angular flints, bearing traces of the mastodon. At Easton Bavant, it abutted upon a bed of light blue clay remarkable for false stratifications and an indurated gravel. This gravel abounded with the remains of several species of elephas and cervus, which were found not rolled but sharply broken, together with the bones of cetaceans of enormous size and much-drifted wood—facts which indicated that the forest bed was a fluviatile or estuarine deposit open to the sea; and that the elephantine and cervine remains had been carried into it by some powerful current. He regarded the German Ocean as the vast trough or river bed, into which many tributary rivers poured their waters on the right and left banks, but closed by chalk hills to the south, so as to afford a communication between this country and the continent, and a way for the mastodon, elephant, and other mammals to traverse. The soil of the forest bed, after being thus deposited, was raised to the surface; the forest grew upon it; great change in fauna took place; different species of elephants and deer were introduced; and then, after remaining stationary for a long period, a gradual subsidence commenced, and the laminated series began to be formed.

THE GREAT SOLAR ECLIPSE.—From the observations made by the experts who were sent out to Bombay for the purpose, it appears that "the spectrum of the red protuberances which are seen around the black disk of the moon during totality, and which have long since been proved to belong to the sun, has been found to present a very remarkable and unexpected appearance, proving that the protuberances themselves are gaseous. These enormous masses of luminous matter, some of which exceed the earth many hundred times in volume, had been supposed to be solar clouds, formed by the condensation of the metallic vapors, which exist within the solar atmosphere, into liquid globules, in a manner precisely corresponding to the formation of aqueous clouds in our own atmosphere." We quote the above from *Engineering*.

NEW EXCITING LIQUID FOR BATTERIES.—M. Delaurier has communicated to the French Academy of Science a note upon a new exciting liquid for galvanic batteries. It is prepared by dissolving 20 parts, by weight, of proto-sulphate of iron in 36 parts of water,—without exposure to the air,—and stirring in seven parts of diluted (equal parts) sulphuric acid, then in the same manner one part of diluted (equal parts) azotic acid. Mons. D. states that this is the most energetic and economical excitant that he is acquainted with, and that it acts without any disengagement of hydrogen or binoxide of azote.

FLUX FOR BLOW-PIPE USE.—Stephen D. Poole sends the *Scientific American* a new flux for blow-pipe use, which will doubtless be welcome to many of our readers. He says: "A mixture of sulphate of lime and fluor spar, in equivalent proportions (say about two parts of crystallized selenite to one of fluor spar finely mixed), forms an easily fusible bead, which by itself gives only a very faint dull red tint (lime) to the flame, but which renders the presence of such elements as give color, most beautifully evident and characteristic. Thus, small portions of lepidolite, petalite, etc., mixed with this flux, impart the fine carmine tint; copper, strontium, their well known colors, especially after continued blowing. Potash and soda minerals (feldspar and albite) are at once distinguished.

TIMBER.

There is no timber along the road, except some cottonwoods on Maggie creek and on tbe north fork of tbe Humboldt—large trees and making tolerable timber of the kind. But in the cañons and on tbe hills tbere is plenty of scrub cedar all over the State, except in the Humboldt Desert country. More wood will be found in the hills than any hasty traveler would imagine, and it is not wortbless by any means, although it is scrub. Nut pines are nowhere found near the railroad, tbe nearest point being 70 miles soutb of Argenta on the Austin road.

LAND PROPERTY.

The lands not having been surveyed yet by tbe U. S. government, are not in tbe market. The government surveyors have got as far as Argenta, running up tbe section lines along the line of tbo railroad only for convenience. Tbe country will be open for settlement as soon as a plat has been made for the U. S. Surveyor General'e office at Virginia City. Government land is held at $2.50 an acre, and the Railroad Co's lands are tbe same, except town lots, which are sold at auction. A great deal of the land along the railroad will be withheld as mineral land; will not go to tbe Railroad Company, and will not be open for preëmption.

MINERALS.

On the Trnckee there are pyritiferous copper ores; on Humboldt Desert there are fine beds of pure salt; beyond tbat, in tbe vicinity of Oreana, there is a curious mineral section, which appears to be different from anything elsewhere known in the world, in baving large deposits of carbonate of lead, probably cerusite (we have not heard of any crystals); at Emigrant Cañon gold has been found; eleven miles beyond Argenta, at Shosbone Point, the railroad cuts through a ledge of argentiferous galeua; near tbe same place—six miles back—coal is found plentifully to smelt tbe same, and thenceforward to Salt Lake there are frequent evidences of coal.

GEOLOGICAL.

Humboldt Desert is volcanic, being covered by a black lava. There are many hot springs, incrusting lime and alkali. A very remarkable country of burning springs, which will become renowned, is situated due south of Beowawe Gate station eight miles. The entire ground for over a mile is covered with little blue flames, and the soil quakes. Indians resort thitber in the winter for warmth. Being on the side of a mountain, tbe fires can be seen eight miles distant, at Beowawe Gate.

Another volcanic region is in the Shoshone Point neighborhood, between Argenta and Gravelly Ford; a pass between two mountains there presents one of tbe most striking views on the road. A lava range, consisting of great bills, crosses there, running north and south. Tbe rest of the country is sedimentary, and to a great extent metamorphic; the country affords many fossil shells, and the sides of the mountains everywhere show parallel water lines, evidencing past submersion. In Humboldt cañon aj fossil mastodon and fossil lizards have been found, which were forwarded for Judge Crocker's museum.

IDAHO BRANCHES.

The Union Pacific Company have come aa far thia side of Salt Lake as Humboldt Wells, and are grading there, working backwards. It is supposed that they intend to branch off to Idaho, as there is not room for both railroads to get through Humboldt Cañon.

Winnemucca, it appears, is to be deprived of its significance as the Idaho wagon road junction, the railroad company baving determined to build tbeir works for the terminus of the Humboldt division at Raspberry Creek (10) several miles on this side of Winnemucca.

Businesses that Pay.

There is a look of prosperity on the streets in San Francisco. Down town, in the leading business streets, tbere is an air of care and responsibility, and not all the faces one meets speak prosperity; but the majority of them do. Montgomery street is filled with passing examples of people in exciting and prosperous business. Kearny street shows evidences of newly grown wealtb, and at tbe same time of moderate possessions, but the class represented by the latter case is speedily being transformed into sometbing evidently substantial. Going up on the hillsides, especially along the streets admitting of a through grade, one sees not only mansions that bave sprung up like spring weeds, but other evidences of wealth and luxurious ease; the latter showing themselves modestly as yet, and properly. But it is out in tbe new parts, where the Irishmen are still grading and the sidewalks have been completed only in stretches, that every object wears an air of life—the Irishmen being apparently tbe best satisfied of anybody .seen. Cartmen, teamsters, mechanics of all kinds, and laborers of tbe steady class, saloon keepers, aud even occasional idlers, who must be driving peculiar trades of their own, appear to be on the high road to wealth. Wood, furniture, and iron manufacturers of all kinds, are carrying on active, and sometime colossal businesses. Not many manufacturing enterprises are languishing, because they are not likely to be long pursned where other things appear more promising. Along the water front of Rincon Hill and Mission bay, and even partly on the Potrero side, there is a surprising array of evidence of great enterprises, and gigantic developments everywbere, that in a few years will present appearances most imposing.

To enumerate the prosperous pursnits in detail would occnpy more space than is necessary for our pnrpose; bnt everything related to building, opening streets, improving real estate, eupplying the wants of people wbether by manufacturing or by agricultnre, or trading in sucb products of nature and of industry as are indispensable, appears as prosperous as could be in any highly favored country. The great enterprises are all undertaken by combinations of industry and capital; affording to capitalist and servant tbe most favorable conditions for their advantage.

To observe correctly what trades and industries are the most certainly prosperous, requires but an intelligent realization of what is going on in the community. The commonest instinct of imitation is sufficient to put any industrious and well balanced person upon the same road of prosperity that others are traveling under his eyes.

Nevertheless, the great compensating fact of history stands out before us that the prosperous are not always the fortunate; tbat the higbly favored in mental and moral composition, in the matter of happiness and in the enjoyment of life, in influence upon the world for its good, and tbose who recruit the lists of fame, are more frequently than not the persons who follow businesses that do not "pay."

OSCILATING PUMP.—At Wadsworth station the C. P. R. R. Co. are about putting up one of H. B. Martin & Co's novel oscillating pumps, which has 6 inches diameter of cylinder, and 10 inches stroke—double cylinders—with a capacity of 10,000 gallons per hour, at 70 revolutions per minute; using from 8 to 10 horse power.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING NOVEMBER 3D.

[No list of Patents for tbe Pacific coast for the week ending October 28th has been received, owing perhaps to the detention of the Overland mails.—EDS. PRESS.]

83,622.—IMPROVEMENT IN BELL PULL.—James Garvey and Matthew H. Kimball, San Francisco, Cal.

We claim tbe application of tbe lifting wedge H, combined with the lug I, which being attached to the pull bar G, operates with it directly on the hammer E, in the manner herein described and for tbe purpose above mentioned.

83,623.—IMPROVEMENT IN BELL PULL.—James Garvey and M. H. Kimball, San Francisco, Cal.

1. We claim the lever D, as constructed, and the attachment of the wedge piece G, thereto.

2. We claim the attachment of the haudle or pull bar H, directly to the lifting wedge G.

3. We claim connecting the lever D, aud hammer K, by tbe spiral spring P, or its equivalent, the wbole constructed in the manner substantially as herein described and for the purposes as set forth.

83,624.—IMPROVEMENT IN SEEDING MACHINES.—Henry A. Gaston, of Stockton, Cal.

1. I claim the rotating fingers wben constructed to operate between fixed fingers f, of a grain sowing machine substantially as above described.

2. The combination and arrangement of the rotating sbaft D, and its fingers d, with the stationary fingers f, and the further combination and arrangement of the relief board H, witb the remaining iuternal machinery of a grain sowing machine, substantially as above described.

3. Tbe spur *c* in combination with the slice C, substantially as above described.

83,639.—IMPROVEMENT IN ROTARY SPADINO MACHINE.—Edward H. Kent, of Portland, Oregon.

I claim the spade bars E, moving in slots O, operated by pawls H, and lever L; also fastening the spade bars E, when extended outward in the slots O, of tbe cylinder B, by the latches D, falling in and out bebind the collars G, with the groovo M, on the sbaft N, and tbe concentric segment I, and combination of the various parts, as herein described and for the purposes set forth.

83,719.—IMPROVEMENT IN HORSE HOES.—Don Carlos, Matteson & Truman Paine Williamson, Stockton, Cal.

We claim tbe combination of the reversible double-edged cutter D, the pivoted bars C, C, and adjustable braces E, with a beam A, substantially as described.

83,742.—IMPROVEMENT IN BINDER FOR SEWING MACHINES.—William M. Stoddard, San Francisco, Cal.

I claim the two pieces, A, B, sbaped, bent, and otherwise constructed and arranged, substantially in the manner and for tbe purposes described.

83,775.—IMPROVEMENT IN CLOCK ESCAPEMENTS.—William C. Kellum, San Francisco, Cal.

1. I claim the detent lever D, with tbe locking screws e, e, the adjusting screw i, and the screw *m*, combined and arranged substantially as and for the purpose described.

2. In combination with the pallets a, a, and tbe locking screws or heads e, e, I claim the two parallel and symmetrical sets of escape teeth E, E, arranged and operating substantially as described.

Tbis improvement consists, first, in so constructing the detent lever tbat it locks by gravitation, or by spring; and second in the use of two sets of escape wheel teeth on the same axle turning in parallel planes, the impnlse being given to the balauce wheel by each set of teeth alternately, and in opposite directions, on the roller.

83,776.—IMPROVEMENT IN CLOCK ESCAPEMENT.—William C. Kellum, San Francisco, Cal.

1. I claim the impulse wheel D, on the same shaft with the escape wheel, D, and having teeth arranged to give an impulse in a direction the reverse of that given by tbe wheel D, substantially as described.

2. In combinatiou with the impulse and escape wheel D, and the reverse-impnlse wheel D, the double-head screw detent, substantially as described.

The nature of this invention is to provide an improved escapement for time-pieces, called a "Back Action Chronometer," and consists in so constructing the escape wheel or wheels, that there are two sets of escape teeth, moving about the samo axis, one of which gives its impulse directly to the impulse roller, while the other set of teeth are so constructed that as they pass tbe impulse roller, or pin, they give it a motion in tbe opposite direction from their own and from the backs of the teetb. We have before mentioned several improvements patented by the same inventor, relating to time pieces.

REISSUE.

3,179.—IMPROVEMENT IN PLOWS.—Patented March 12, 1867.—Don Carlos, Matteson & Trumau Pane Williamsou, Stockton, Cal.

We claim the curved standard A, with the lug B, and the off-sets, D and E, substantially as and for the purpose described.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Nov. 16, 1868.

Vice President, Dr. J. G. Cooper, in the Chair, and nineteen members present. The President, Dr. James Blake, afterwards entered and took the Chair. Proposed for membership: J. J. Owens.

DONATIONS TO CABINET.

Dr. Gibbons, on bebalf of W. C. S. Smith, of Napa, prescnted a fossil bone which was exhumed in digging a well at a depth of twenty-six feet, five miles south of Antioch, and two miles from the coal mines; also, fossil teeth from the same neighborhood, thirty feet below the surface, and in twenty feet depth of solid rock.

Gregory Gale exhibited a specimen of sand taken from a fissure in Hayward's, which was caused by the earthquake.

Dr. Cooper presented, on behalf of Rev. S. D. Simons, a fossil sbell found in a beap of aspbaltum, whicb was being used for paving our streets. It is not known on this coast, and is remarkable for having no trace of lime left,—aspbaltum having takeu the place of every otber substance.

CHEMICAL ANALYSIS.

Mr. Louis Falkenau read a letter on "Cbemical Analysis," explaining the different methods and illustrating the same by means of chemical apparatus.

Tbe thanks of the Academy were tendered to bim for his lecture.

CONCERNING EARTHQUAKES.

A discussion concerning tbe earthquake took place, and it was stated tbat Dr. Farnsworth felt severe shocks on the 3d and 4th of Sept., in the Kern River country, while traveling on a trail from Independence to Visalia. He had encamped for the night in a cañon, and on the evening of the 3d, several slight shocks took place, but the next morning while at breakfast, a heavy sbock occurred which sent large boulders down the mountains on either side. In tbe space of one hour he felt forty shocks, and in three days 500. It was quite smoky at the time, altbough no forests were on fire.

Mr. Yale spoke of an old adobe building which, seveuty years ago, was a fortification against the Indians, but was now tbrown in all directions. He thinks if we had the proper means of estimating, we should find that our coast had been elevated. Dr. Gibbons thinks tbere are volcauic eruptions of steam or gases in subterranean caverns, which, not finding vent, rush along underground. Higb buildings are mnch safer tban low ones, as it bas been observed that the high structures bave escaped with little injury. It is explained by the fact of the vibration becoming deadened before reacbing the top; before the upper portion can respond to the motion it is met by the returning wave which counteracts tbe first. In Alameda, a water tank on stilts thirty feet higb was not disturbed, while oue ou the ground near by had the water thrown out violently.

The Academy adjourned at 10 o'clock. The next regular meeting will take place on Monday evening, Dec. 7.

THOSE spectacles advertised "lost," for which a very large reward was offered, were purchased at Muller's, 205 Montgomery street. *

WATCHES AT FAVORABLE PRICES.—Howard & Co., of New York, who are well recommended, offer to sell American Waltham watches on reasonable terms. *

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, November 21, 1868.

Financial.

The very active demand for money noted in our last issue continues unabated. Deposits in our Savings and Loan institutions are very considerable, but not more than are constantly required for use. We see no reason to predict an easier money market for a steamer or two; neither is there ground to believe that it will be any more stringent. Much disinclination is shown to lend money on mortgages. Short loans on the best collaterals, repayable in monthly instalments, seem to be the only ones which find favor at present. Rates in bank rule at 1@1¼ per cent. per month for first class double endorsements; less acceptable paper pays 1½ per cent. Gold bars are quotable at 810@850, and silver bars from par to 1¼ per cent. premium. Currency bills on Atlantic cities are taxed 33⅓ per cent. premium on gold, and sight drafts, payable in coin, are negotiated at 1 per cent. premium; Telegraphic Transfers are effected at 1¼ per cent. premium; Sterling Exchange is made at 483¾@484; Commercial Exchange 491/2@493¾; Mexican Dollars command 3⅛@4 per cent. premium. Gold in New York on the 19th of November was 134⅛. In our local market Legal Tenders rule at 73¼@73¾. The steamer Continental arrived here from Mexico on the 16th November, with $275,000 in Mexican dollars. Independent of the efflux of treasure to the East, China and Japan, the Central Pacific Railroad draws from this city one million of dollars in coin each month, to pay the hands employed by the company, and as the field of operations is now quite remote, these sums do not find their way back very promptly; the tardiness of return being much greater in winter than in any other season of the year.

Our City Treasury contained about a million and a half of dollars on the 31st of October, while the State Treasury contains, probably, as much more. All this money is locked up from the requirements of business and helps to promote stringency. Large sums have also been invested in the White Pine mining district, and in other extensive operations distant from the commercial center. Immense stocks of cereals remain unsold in warehouse, the advances upon them having sought the agricultural districts, where they remain unemployed.

Our Branch Mint has been exceedingly active for the past three months, but is much more so at the present writing than at any other period this year. All the departments are taxed to their utmost capacity, and would be so were they twice as extensive. The principal coinage is in double eagles.

A new, elegant and commodious Branch Mint has been just erected at Carson City, Nevada. It is built of sandstone, quarried near the locality, and is described as being one of the finest edifices on the Pacific coast. The material is rather soft when first quarried, but hardens upon exposure to the air. The building is ninety feet front by sixty feet deep, and its architectural beauty is mentioned in terms of praise. The edifice alone cost $190,000 in currency, and with all its machinery and appliances in running order will cost a quarter of a million, currency. Fifty tons of machinery have been sent out, a part of it being on the way, to J. M. Eckfeldt, melter and refiner of the San Francisco Branch Mint, and will be put up, under his direction, in the Carson branch. It is not possible to form any estimate now of the amount of business which the new mint will be called upon to do. While some parties entertain the impression that the Carson branch will be kept quite busy, others think that it will be idle, and that the whole affair is a useless expense and unnecessary drain. Time will determine the question.

The rainy season may be said to have fairly set in with a soaking rain, which commenced on the evening of the 18th instant, settling the question of the next year's crop, and knocking the underpinning out from the croakers who have been predicting a season of drought and scarcity in 1869. There is reason to believe that it has been general and will render the soil available for tillage, while it ensures the germinating process of the seed already sown.

An idea of the increase of Stockton may be gathered from its real estate transactions during the past three years. The sales of real estate in that place for the first ten months of the current year are given at $825,000, against $654,000 for the same time last year, and $343,000 for the same time in 1866.

The California Pacific Railroad has been completed, and the cars are now running from Vallejo to Washington, opposite Sacramento. The steamer New World has been completely overhauled, and put in the best condition. She will soon take her place on the line between this city and Vallejo, to complete the connection.

On the 18th November the election for Directors of the P. M. S. S. Company took place in New York, when the following named gentlemen were chosen for the ensuing year: Allan McLane, Wm. Dennison, J. M. Brown, Howard Potter, A. A. Low, Francis Skiddy, Jonathan Thorn, William H. Webb and Sydney Mason.

The steamship Oregonian, late of the North American S. S. Company, arrived here on the 19th. She has been purchased by the P. M. S. S. Company. Under the rigorous direction of such men as W. H. Webb, Jonathan Thorn and Francis Skiddy, it is probable that the new line to Australia, via Honolulu, the Fejee Islands, around the south of Caledonia, and thence to Sydney, will be inaugurated at an early day. The schedule time from New York to Sydney is laid down at twenty eight days. An enterprise of this character must prove eminently beneficial.

The shipments of Treasure from November 1st to date (exclusive of Government account) have been as follows:

November 4—Per Japan—

To Obina	$761,076 44	
To Japan	20,000 00	
		$781,076 44

November 6—Per Constitution—

To New York	$191,565 66	
To England	114,933 08	
To France	50,968 37	
To Panama	15,000 00	
		372,467 11

November 11—Per Golden Age—

To New York	$220,183 98	
To England	106,054 89	
To Panama	10,000 00	
		336,238 87
Total since November 1st, 1868		$1,489,782 12
Previously this year		30,458,874 91
Total since January 1st, 1868		$31,948,657 03
Corresponding period 1867		35,954,583 98
Decrease this year		$4,005,926 95

City Stocks.

During the week under review we note the following sales in the Board of miscellaneous securities: 65 shares San Francisco Gas stock at $72 50@73; 82 shares Spring Valley Water at $65 60@65 per share. The North Beach and Mission R. R. Co. and Omnibus R. R. Co. have passed their dividends for the present month. At the close, North Beach and Mission Railroad Company sold at $65 50.

Mining Share Market.

The market for mining shares exhibited considerable activity during the period under review, sales of a few leading stocks being very large. The tendency has been toward improved rates, and a somewhat healthier feeling prevails at the close. Our information concerning the Comstock claims is comparatively meagre, nothing of any special interest having transpired since our last weekly reference.

IMPERIAL—ruled at $90@100, and at the close sold at $98. The three first shipments of bullion during the current month aggregate $18,968, against $19,197 same time in October. In reference to the condition of the mine we learn that the drift running west on the 900 level, near the Imperial north line, is in quartz and porphyry. The main shaft has attained a depth of 1,057 feet from the surface, work progressing at the rate of two feet per day. The drift on the 750 level, Alta mine, has been run north from winze 75 feet, and they are now cross cutting east from said drift, which is reported to be in barren quartz. The ore supply from the 700 level up continues about the same. They extract about 140 tons per day from the Alta mine.

CROWN POINT—opened at $42, declined to $38 50, improved to $43, and closed at $44. Advices of the 15th inst. state that the 850 track floor has been carried north nearly to the north winze, and is showing a body of fair ore all the way. The stopes above the 850 level exhibit no change since previous report. Sinking in the shaft goes down slowly. The winze commenced on 900 level, just north of south winze, had to be abandoned on account of a large amount of water that came in at the depth of nine feet. A small seam of ore is reported to have been encountered in this winze, but at the time of abandonment gave out, and the bottom was in porphyry and quartz, with little or no ore. The first shipment of bullion for October account amounted to $10,320.

GOULD & CURRY—sold during the week at $70@82. The Bonner shaft has been sunk seven feet during the week ending Nov. 14th, the material extracted being the same as previously reported. At the close of the present week they intended to make the seventh station, as before reported. They continue to take considerable ore from the croppings, 52 tons of good mill ore having been extracted during the period under review.....KENTUCK advanced from $195 to $247 50, and closed at $246. The bullion returns for November account to the 16th amount to $16,081.

CHOLLAR-POTOSI—sold within a range of $128 50@143 50, closing at $142 60. On the 17th inst. this company received $14,006 86 in bullion. For the week ending 13th, extracted 1,140 tons of ore. As the work is carried up in the Blue Wing stope, the ore stretches out to the north and south. In the new shaft sinking continues in hard rock. The drift going north has become softer, but the cross-cuts east and west are in very hard porphyry.

AMADOR—sold at $210@217 50. The first clean-up for November shows a bullion product of $24,000. A dividend of $4 per share was paid on the 20th.....EUREKA disbursed a dividend of $5 per share on the 20th inst.

OVERMAN—has been pretty active, selling at 48@42, then at $45, and closing at $46. On the 12th inst., $3,415 in bullion was shipped here, and on 17th, $2,861. An assessment of $20 per share was levied on the 13th inst. ....SIERRA NEVADA levied an assessment of $12 50 per share on the 16th inst.

ALPHA—declined from $33 to $30, advanced to $38, and closed at $37 50. A connection has been made by this company with the Imperial on the 940 level. The raise from the 940 level is reported to look very well, and the drift on the same level is said to be in very good looking quartz. The face of this drift is 83 feet from the main drift, or 163 feet north of the south line....OPHIR advanced from $18 to $25, and closed at $23. The new shaft is now 539 feet in depth.

SAVAGE—has been quite largely dealt in, over 8,000 shares having changed hands within the past week, selling at $69 60@62 50, then at $70 50, and closed at $69 50. ....YELLOW JACKET has also been in better request, rising from $825 to $1,200, and at the close reahzing $1,195.

The sales in the Board during the past week amounted to $1,703,207.

THE LUMBER TRADE SUDDENLY INCREASES.

During last week an unusually large amount of lumber arrived at this port, mostly from the Mendocino and Humboldt mills. On Saturday last there were received here not less than 4,285,000 feet of lumber and 505,000 laths. It is not improbable that the late earthquake has had something to do with this, as it undoubtedly created a very general preference for wooden houses to live in.

News can now be telegraphed from Hongkong to San Francisco, by way of Europe, in ten days.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

CITY PAVING CO.—San Francisco, Nov. 14th. Capital stock, $500,000. Trustees: Charles E. McLane, Wm. Alvord, Robert C. Page and Henry F. Williams.

TAMALPAIS LUMBER CO.—Marin county. Nov. 15th. Capital stock, $1,500,000; 1500 shares, $100 each. Trustees: S. F. Butterworth, Alvinza Hayward, W. C. Ralston, Lloyd Tevis, W. E. Barron, L. L. Robinson and Charles Webb Howard.

SAN FRANCISCO LAND CO.—San Francisco. Nov. 17th. Capital stock, $5,000,000; 20,000 shares, $250 each. Trustees: E. C. Boorhar, Geo. R. Cutbirth and Trustum C. Gilman.

EUREKA SOUTH.—Our agent, who recently visited this mining town in Amador County, reports the miners busy preparing for winter. Every one seems to have great confidence in the richness of the mines. A larger population and lively times are anticipated in the spring.

NEW HALL OF THE Y. M. C. A.—A fine library building with lecture room has been erected on Post street, by the Young Men's Christian Association. It was dedicated on Tuesday evening, Dr. Eells delivering the address.

COAST STORMS.—Along the Mexican Coast they have just experienced the most severe storm, attended by rain, that they have had for forty years. Scarcely a trace of it was observable in this latitude.

OREGON CLIMATE ADAPTED TO SILK CULTURE.—Dr. William Kohler, of Portland, Oregon, says he has found that climate suitable for the raising of healthy cocoons, and for silk culture.

CONCERT AT WOODWARD'S GARDENS.—The proprietor of these beautiful gardens is now giving a series of concerts, commencing every Thursday at 1½ o'clock P.M., under the direction of Prof. Joseph Schmidt. The Sunday concert as usual. *

A CORRESPONDENT of the American Institute Farmer's Club says relative to the names of "Timothy" and "Hurd's" grass, that it was called foxtail in England, and was brought from England to Rhode Island by Timothy Hurd.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Nov. 7th: The Rippon Co. have levied an assessment of $1 per share.

We have learned from one of the stockholders in the Tarshish mine, that the company has under consideration a plan which will soon put the mine running and a mill in process of construction.

Star matters are delayed somewhat by the non-arrival of some portion of the minor machinery about the hoisting works. Supt. Gamble assures us he could have been ready to start the engine early next week but for this delay. Meantime two 4-horse teams are hauling ore from the mine to the Pioneer mill.

Amador County.

Jackson *Ledger*, Nov. 14th: The Seihenthaler mine is now down to the strong water level, and will probably require steam hoisting works before it can be worked deeper. The south drift is in over 100 feet, and the ore still comes up to its high standard.

The Thoss sulphuret works are turning out their regular weekly bricks, and still maintain their reputation as the most successful works in the State.

Steam hoisting works on a magnificent scale are now in process of erection on the Summit mine, and our old friend Jo. Swift insists that he will make them the best in the county.

As the rainy season approaches, work on the mines is pushed ahead with renewed vigor.

The hoisting works on the Anaconda are up and inclosed, and the engine set and secured from the weather. In ten days or two weeks the shaft will be completed and everything ready for work.

The Vaughn mine tunnel is still being pushed ahead with evident signs of the pay chimney near at hand.

Dispatch, Nov. 14th: The quartz mines in this vicinity still continue to "shell out" an abundance of "oro."

The rock recently taken from the Summit mine, near Sutter Creek, is much richer than any that has heretofore been struck in that vicinity. The company have determined to erect steam hoisting works on the claim, the boiler for that purpose being now on the ground. We also learn that there are other newly discovered claims in that vicinity which yield very flattering prospects, and upon some of which arrangements have already been made to erect steam machinery for hoisting, etc.

Butte County.

Oroville *Record*, Nov. 14th: The quartz mining interest of Butte is rather reviving than otherwise. Mr. Slater has recently erected a steam quartz mill on the Carleton ledge near Forbestown. The famous Jenny ledge, of Granite Basin, seems to have suspended for the season. The Halstead mill, in the same locality, but on another ledge, has yielded very well. We learn also that the Jordan mill and mine, near Yankee Hill, is to be again put in operation. The contract has also been let for the erection of a new mill on a ledge that prospects very rich in the vicinity of Mineral Slide. Mr. Edward Pond, of San Francisco, and others are interested, and Geo. Swift is superintending its construction. Quartz ledges are as numerous in this as in any other county in the State, and we believe as rich. But few have been prospected, and they not to any considerable extent, and less have been worked.

Calaveras County.

The Murphy's correspondent of the Mokelumne Hill *Chronicle* of Nov. 11th, says: At Angels' Camp you can hear the music of 66 stamps pounding out the precious metals, night and day. The above number of stamps are run by four mills—three by steam and one by water power. The mines are worked from depths varying from 200 to 300 feet, and are all paying well; so I think that Angels Camp bids fair to become one of the most flourishing in Calaveras County in a few months. There are several other claims there that are expected to be worked soon.

My next stopping place was Vallecito. There is but little mining of any kind going on there. Only one claim of importance; that is the company which run a tunnel from Coyote Creek into the Flat. They are at present making great preparations for working their claim by hydraulic washing, when they expect large returns. I then moved on for Murphys passing through Douglass' Flat. There are several very good claims, all deep diggings, at Douglass' Flat. The hoisting and pumping is done by overshot water wheels.

Inyo County.

A new process of working ores is proposed, and being tried by a miner of this county, which, so far, consists in placing the quartz or gold rock, as the case may be, dry crushed into an iron cylinder, with a quantity of mercury, and applying a low degree of heat to the whole. The cylinder is then made to revolve rapidly. The new method is said to work well in small quantities, and the inventor says he is sure of being able to work much larger quantities, when suitable machinery is erected.

Los Angeles *News*, Nov 13th: There are now on the road from Owen's River, several wagons loaded with silver ore and bars. This ore is smelted on the river. The metal contains enough lead to pay all expenses of mining, smelting, transportation to San Francisco, cost of separation, commissions, etc., leaving the silver a clear profit, amounting to over $100 per ton. The shipments are becoming quite frequent from Owen's River to this city, and is a tangible evidence of the richness of the mines.

Since writing the above, we learn that Messrs. Eakin and Gray have arrived in this city, bringing with them 11,000 lbs. of silver and lead bullion, from the Cerro Gordo mines, worth about 40 cts. per lb.

Mariposa County.

Mail, Nov. 13th: Walcoch, Johnson & Co. struck a rich pocket of quartz in their claim, near Hunter's Valley, last week. Report has it that they have taken out $100,000 up to this time.

Gazette, Nov. 13th: The Maggie Russel vein which is situated near the Merced river about a mile below the Benton Mills, and which was recently purchased by Wilcox & Keyton, of Bear Valley, is at present turning out very rich rock, and the prospect becomes more flattering as they sink upon the vein. The proprietors intend to erect a new 8-stamp water power mill, the machinery for which is now about completed.

Nevada County.

Gazette, Nov. 12th: A crushing of seven loads of quartz from the Dromedary mine was cleaned up Tuesday, and yielded $420.

Nov. 14th The mining ground extending up from the south of Little Deer Creek to a point near Canada Hill, a distance of over a mile, was sold yesterday to Ah Chow & Co., Chinamen, for $2,500. The sale includes nearly all of the Head, Morrow and McElvey claim, which has been worked more or less for 18 years. It has yielded an immense amount of gold, and been owned by many different parties, but has never before fallen into the hands of the Celestials.

Grass Valley *National*, Nov. 9th: The John Bright mine is situated south of the Ione, and one of the most promising ledges in the neighborhood. The last crushing of 65 loads was cleaned up at the Gold Hill mill on Saturday last, and yielded $1,730.50, an average of over $28 per ton. This is the fifth crushing from this ledge, and all of them have paid well, running from $28 to $50 per ton. A tunnel of 180 feet in length has been run on the ledge, and there is work ahead now for four years at least.

Nov. 11th: We have the following from the Coe mine: At a depth of 150 ft. on the incline the ledge is from four to five feet ft. thick and the rock will pay, on an average, $30 per ton; at a depth of 200 ft. the ledge will average three ft. in thickness, and the rock will pay as high as $40 per ton. About 20 tons of rock are taken out in 24 hours, and from 16 to 18 tons are crushed daily by a 10-stamp mill located on the ground.

Nov. 14th: N. K. Lamson has contracted for putting 10 additional stamps at the Coe mine. They are to be put up within thirty days. The mine is 2,550 feet in extent. They are now down 360 ft., and drifting on the first and second levels. The ledge in the west drift is over four ft. thick; gold can be plainly discerned in the rock, and the sulphurets are plenty and rich. Pending the erection of the additional stamps, their rock will be crushed at the Gold Hill mill. A contract has just been let on the Aspinwall, an adjoining ledge east of the Coe.

Grass Valley *Union*, Nov. 11th: Large loads of quartz constantly go through town on their way to the custom mill below, by which we judge that the upper portion of the district is being actively prospected.

Excelsior.—*Transcript*, Nov. 10th: The Mohawk and Montreal mine, in Meadow Lake township, is yielding first rate. On the 2d inst. they struck, in the east drift, upper shaft, a stratum of sulphurets from 15 to 18 in. wide, which averaged $176.80 to the ton. These sulphurets were tested by the chlorine process and yielded at the rate of $212.50 to the ton. The company is satisfied with the permanency and richness of the ledge, and propose to work it continuously all winter. The mill is now running, and the amalgam upon the plates looks first-rate. They will have a clean up about the 12th or 15th. The first snow storm of the season, at the mine, occurred on last Thursday, covering the ground to the depth of nine inches. The weather has since been fine but decidedly wintry.

Sierra County.

Downieville *Messenger*, Nov. 14th: Kime & Davis have taken a contract to erect a quartz mill on a ledge several miles below Alleghany. The mine is well prospected and the prospects are excellent.

The Grass Valley *National* of Nov. 19th, says: John Greenbank, an old Grass Valleyan, gives us the following items respecting the Alaska mine, at Pike City, Sierra County, of which he is the amalgamator. The owners have located 2,000 ft., and a shaft 146 feet in depth, running with the vein, has been sunk. The ground has been soft, easily worked with the pick, and no blasting has ever been required. They have been running west most of the time; running east no ledge was found for 200 ft., but last Saturday it was struck and yielded very rich rock. The rock has paid from $12 to $200 per ton, from the surface down. They have a small, 5-stamp prospecting mill, with which 350 tons have been crushed yielding over $13,000, without the sulphurets, which are very rich, having assayed $380 to the ton.

Trinity County.

Weavervillo *Journal*, Nov. 14th: Jas. Johnson picked up a 30-oz. chunk in his claim in Little Pappose Creek, about two weeks since. The piece was worth $500.

McGillivray is pushing work on his ditch from Cañon Creek, and it will be completed to opposite Independence Bar by the commencement of winter.

Yuba County.

Marysville *Appeal*, Nov. 17th: The Pennsylvania mine is under the management of S. Cumming. Incline No. 2 has been closed, and all the work being done is in the old incline, where a ledge believed to be rich has recently been partly developed. On the strength of this discovery the stock of the company has recovered somewhat, there being inquirers for it at figures higher than at any time since the last assessment. Stockholders are again hopeful.

ARIZONA.

Prescott *Miner*, Oct. 31st: Weaver, or Antelope Hill diggings, in this county, are famous for producing big nuggets of the yellow gold. Deputy Sheriff Taylor showed us the other day some beautiful specimens that were recently dug out of the old diggings.

At last accounts the Sterling mine was looking good, and work upon the furnaces, etc., was progressing finely.

The shaft in the Teshatticup mine, at El Dorado Cañon, is sunk on the main ledge to the depth of 100 feet, and a tunnel between 200 and 300 feet in length connects with the shaft, but for a year or more it has been lying idle, owing to some disaffection among the owners. The last hundred tons taken from the mine and crushed, without assorting, yielded over $100 per ton. Recently, the firm of Stephen Otis & Co., of San Francisco, who own a 10-stamp mill at the mouth of the cañon, leased the mine, and have now 16 men engaged in getting out rock. The rock that they are now extracting is reported to be immensely rich in silver. It is strictly a silver ledge, and is considered by persons in that vicinity second to no other mine on the Pacific slope.

The San Francisco Moss Ledge Co., in Mohave County, have erected a 10-stamp mill on their mine at a cost of $30,000. During the erection of the mill they succeeded in running a tunnel between 200 and 300 feet, striking the main ledge at a depth of about 80 feet. A great many tons of rock were taken out and hauled to the river and crushed, but with what result, outsiders were never able to find out. It was evident that the mine did not pay, as they soon suspended operations, and the mill has been lying idle for about one year.

COLORADO.

Central City *Register*, Oct. 29th: Black Hawk never looked better than at present. Its streets bustle with business, while its quartz mills are stamping out the precious stuff from day to day.

The mines at Empire are producing over $800 per week.

Mr. Gorton, who is putting up a new furnace near the Franklin mine, for the purpose of smelting its ores, will have it ready to run in about two weeks. The mine is being worked day and night, and now has about 300 tons of ore out.

The Georgetown correspondent writes: The Terrible lode continues to roll out very rich ore in as large quantities as ever. The working shaft is now down 80 ft., and levels have been run both ways from the shaft, the east level being 120 ft. in length, and the west level 80 ft. In both these levels, as well as down the shaft, the pay vein, has averaged 10 inches in width, and the ore is worth from $500 to $700 per ton at the shaft. The ore is now crushed and dressed at the shaft, and most of it is shipped east for reduction. The purest of the ore is simply hammered-dressed, and the second quality is crushed and jigged.

Prof. Martine has shown us some very rare and remarkable specimens of silver ore from this vicinity. One specimen from the Wm. B. Astor lode, which resembles a partially decomposed galena ore, containing numerous specks of some decomposed mineral of a reddish brown color, yields 48 per cent. of silver.

Another singular specimen is a piece of pure galena that yields 11 23-100 per cent. silver, or $42.11 per ton. The sample has been very carefully examined by several experts, and is pronounced by all a true, pure galena ore.

Dr. Seaton is steadily progressing with his Mason process in the McIntyre mill at Mill City.

The mill in Lake Gulch, owned by Cheney & Hill, is now crushing ore from the Gardner lode on Quartz Hill, averaging about six cords per week.

Several promising lodes have been discovered near Mill City, the ore from some of which assays very largely in silver.

MONTANA.

Helena *Post*, Oct. 30th: We saw in the First National Bank yesterday evening, 13 pigs of silver bullion, weighing 483 lbs., the result of the last clean up in the St. Louis and Montana Mining Co's mill at Phillipsburg. The rock from which this was produced came from several different lodes.

Confederate Gulch has not yet ceased astonishing the natives. Maj. Davenport informs us that on Tuesday last there was found in the claim of Messrs. Ingram & Co., a nugget worth $490.

We learn from Highland district as follows: Professor Swallow having completed his mill, is to start up crushing rock from the Ballarat and Forest Queen lodes tomorrow. His mill is one of the best arranged in the Territory, is furnished with Wheeler's pans and all the contrivances to save gold. All the arastras in that section are in full operation, and present prospects indicate future success.

The correspondent at Summit gives the following: Dr. O'Neal has commenced sinking a shaft on claim No. 1, on the Ora Cache lead, with prospects of striking rich quartz within a few days.....The John How tunnel is still being run. It is now 500 feet in length, and it is supposed that 75 feet more will bring it to the ledge.... A shaft 200 feet in depth has been sunk on the Kearsage, and work upon it is still in progress.

At Sterling, work has been resumed upon many of the abandoned lodes, with great promise of abundant results. The Red Bluff opens very rich. Large quantities of fine ore are taken from the Convoy, and several other lodes are yielding largely. Prof. Ward is about to return to the Territory with the intention of recommencing operations.

Alder Gulch will produce a larger yield of gold than any season since 1865. The recent reports of rich gulch diggings in Ram's Horn district are fully confirmed; and these, with the promises given by Summit, Hot Spring, Rochester, and Silver Star, in quartz, gives assurance of great activity at the capital next year.

IDAHO.

Owyhee *Avalanche*, Nov. 7th: The Golden Chariot mine continues to yield as largely as ever.

The Lincoln mill is undergoing a thorough and substantial renovating. Mr. Wilson informs us that they will be ready to start up again sometime between the 11th and 15th inst. It will run on the far-famed IdaE lmore ore.

NEVADA.

Humboldt.

Winnemucca *Argent*, Nov. 14th: The Willow Creek placer mines prospect from four to six cents per pan. A district called Willow Creek has been formed and laws enacted to govern it. Claims, 300 feet each. Many locations have been made, extending from the upper stage road for a mile above. A few claimants are prospecting their claims now with a view to systematic work next spring.

The prospecting done shows a 5-foot bed of gravel, and the evidences of a heavy wash through the cañon. The mountain range is of slate formation, and contains many large quartz veins, but none bearing much mineral has been discovered. This range is said to present the most favorable indications of placer mines of any in the State.

S. Kunkel & Co., at Battle Mountain, are taking out and shipping ore to San Francisco, which abounds in horn silver and a black silver ore which assays high up in the thousands per ton, and all the ore gives large results. The mine is 3½ miles from the depot, and is supposed to be a part of the Union Series. Kunkel & Co. are running a tunnel in the vein, and it is now in 120 feet, with a well-defined ledge at all points. Some ore brought to our office from the extreme end of the tunnel, shows much horn silver. Tuesday last eleven tons were shipped for San Francisco, and from returns before received and the developments in the mine, there can be no doubt but ore shipments will continue to be made and in increased amounts. The Little Giant mine at Battle Mountain is keeping up its rich reputation. Atchison's mill recently started up on ore from it, and G. W. Fox passed the other day with $7,000 worth of bullion. Other ores from this district have been tried by mill process and show large yields.

The Gold Run mines continue to improve in appearance, and the average yield of the Golconda ore is increasing as well as is the fineness of the bullion.

Unionville *Register*, Nov. 14th: Fall & Co. shipped this week, per Wells, Fargo & Co's express, 2,000 ounces of fine bullion.

Arrangements have been made to prosecute operations on the Seminole mine.

Virginia *Safeguard*, Nov. 15th: Speaking of the Battle Mountain district it says: In the district there are many other claims accounted good, which are being developed as rapidly as work can accomplish that result. We were shown the other day by Mr. Adams, an experienced prospector, the result of assays from several undeveloped claims which ranged from $100 to $250 per ton. Copper ore is found in great profusion at the base of the Battle Mountain range. There are about 40 men in the district, all actively engaged in prospecting.

Virginia *Enterprise*, Nov. 11th: Bousefield & Co., assayers in this city, yesterday received a very fine lot of silver bullion for melting and for assay, from the Little Giant mine, Battle Mountain, Humboldt County. The lot of bullion was the result of a crushing of 31 tons of ore worked at Atchison's mill, near the mine, and weighs 443 pounds, which has been molded into five beautiful bars. The total value of the bars is $7,616.80, being at the rate of $545.69 per ton, The average value per ounce of the five bars, $1.27, and the average fineness, .981—the bullion contains no gold. The Little Giant mine is the property of Messrs. Fox & McBeth, and although an outside mine (outside of White Pine?), it appears to pan out about as well as some of our "inside" mines. The bricks may be seen to-day on the counter of the Bank of California, in this city.

Reese River.

Austin *Reveille*, Nov. 6th: Six bars of bullion, of the average fineness of .981, and valued at $8,364.65, were brought into this city yesterday from the Monte Cristo mill at White Pine.

We saw a fine lot of bullion to-day at the National Bank, which had just been brought into the city from the district of White Pine. The lot consisted of 28 bars which were valued at $41,884 59. It was produced at the Oasis mill, formerly belonging to Gen. Page, but now the property of the Ebenhardt Co.

Nov. 9th: Seven bars of bullion, valued at $9,840.85, were brought into this city to-day from the Centenary mill at Newark.

Nov. 10th: Yesterday the first bar of silver produced by the mill of the Quintero Co. in the district of Northumberland, was attached in three suits by workmen for labor. The bar was valued at some $1,100. The mill had just been finished, but it was attached a few days ago by P. M. Elder for about $3,000.

Nov. 11th: We saw to-day at Paxton & Co's bank 12 bars of bullion, averaging .976 fine, and valued at $19,059.75 which were brought into this city last night from White Pine. They were produced by the Oasis mill of the Ebenhardt Co.

Yesterday afternoon David Lundbom received 4,202 ounces of bullion for assaying from the Old Dominion Mill at Hot Creek.

Nov. 12th: We saw to-day at the assay office of David Lundbom six bars of bullion, averaging .965 fine, and of the value of $7,568.67, which were brought into the city from the Monte Cristo mill at White Pine.

We learn that Col. Buell's mill at Belmont, which has been thoroughly repaired and furnished with roasting furnaces, was set in motion on Tuesday the 10th instant. There is every prospect of a full supply of ore from the Highbridge, Pennsylvania and El Dorado mines.

Virginia *Enterprise* Nov. 15th: A letter written at White Pine by a person whose truthfulness is vouched for by the editor, says: We have now been in this burg just one week, and I will not now hesitate to express my opinion freely, frankly and fairly. That opinion is that these are doubtless the richest mines here ever discovered on the Pacific coast; but tell your friends that if they know when they are well off they will stay where they are this winter, and not think of coming here before late in the spring. You have seen many newspaper reports in regard to this district, but they only present one side of the picture, in telling of the richness of three or four mines—they don't tell that where there is one mine yielding good ore there are a score of men who have expended all their labor and money and have not yet got a color; that lumber is $125 to $150 per thousand feet, and not to be had at that; that wood is $12 per cord; that provisions are very scarce and likely to be more so; that lodging cannot be had; that water has to be brought from Hamilton, four miles, and is sold by the bucket, and many other things that they do not stop to consider in their praise of a newly discovered mining country.

Mr. Dunn, a millman of much experience and who for a number of years has owned and run a mill on Six Mile Cañon, has sold out his establishment there and is making arrangements to erect a first-class mill in White Pine District, convenient to the principal mines in that region.

The Virginia *Safeguard* of Nov. 10th says of White Pine: We are told that no regularly defined ledges are yet known to exist in any part of the district. On the contrary, ore which assays up into thousands has been found in almost every portion of a section of country ranging from two miles in length to a mile and a half in width. Treasure Hill, on which is located Treasure City, and containing the famous Eberhardt and other celebrated mines is enthusiastically put down as a mountain of silver. At all events, the highest grade ore found in the district has been taken from this mountain, which beyond doubt is fearfully and wonderfully rich, but how extensive it is as yet impossible to determine. The deposits or mineral formations of the low land is described as resembling coal beds, and here is found the low grade ore—if it may be said there is any in that country. Chloride Flat embraces a quarter section or more of land, most of which prospects well so far as tested. Numerous shafts have been sunk at intervals throughout the length and breadth of it, many of them striking ore in paying quantities at a depth of from 15 to 20 ft. The great want of the country is mills, there being but one in operation at present, though there are several others in course of construction. Our informant estimates the number of people in the whole White Pine country at 4,000 to 5,000, but thinks not more than two-thirds of the number will attempt to pass the winter there.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Nov. 11th: From two pounds of ore (given them for melting by an employé of Wells, Fargo & Co. in this city) Bousfield & Co. yesterday obtained a bar of pure silver weighing a little over 13 ounces, and worth $13.03—showing the ore to have been nearly 50 per cent. silver.

The Virginia and Gold Hill Water Co. yesterday declared their regular monthly dividend (No. 60) of one per cent. on their capital stock.

Nov. 13th: The new Ophir shaft is now down 535 feet. It is still in very hard rock, and Giant Powder is used in blasting. They have expended much time and labor in excavating a bob-pit in the side of the shaft at a depth of about 400 feet.

Nov. 14th: The Sierra Nevada Mining Co. yesterday took to the office of E. Ruhling & Co., in this city, 338 ounces of retorted gold amalgam, the result of a run of 10 days on rock from their own mine. The exact value of the lot of bullion we were unable to ascertain last evening, but it is supposed that upon being assayed it will show a better yield per ton than any ore the company have yet worked from their mine.

There was shipped from the express offices in this city and Gold Hill, during the past week, 8,275 pounds of assayed bullion, valued at $200,602.32.

Mr. A. Koneman, an old Washoeite and a gentleman who has had much experience in milling, is engaged in erecting a fine new mill on Gold Cañon, a short distance below Johnstown. He intends to have the mill ready to start up in about two weeks.

Engineering.

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

This Society held its regular meeting on Tuesday evening, Oct. 27th, at the Cooper Institute, the President, Jas. A. Whitney, in the Chair.

Joseph B. Lyman, Esq., read a paper from J. T. Kirk, Esq., upon the subject of

SEWERS AND SEWERAGE SYSTEMS.

The author, after reviewing the subject generally, stated that it had received more attention and consideration than perhaps any other subject affecting the sanitary condition of cities, both in Europe and in this country; and that there had been more money expended in constructing and improving the sewerage systems of the larger cities, than upon almost any other public improvement—much larger sums having been expended, and better systems devised in the large cities of Europe, than in those of this country. In Paris and London the sewerage systems were very extensive, having required the best engineering talent, and involved the expenditure of large amounts of money in their construction; that of London having cost twenty-five million dollars, the sewers being some ten feet in diameter and ten miles long, and at some places seventy-five feet below the surface. The Paris sewers were spoken of as large enough to admit of the passage of boats of considerable size through them, and frequently these boats were laden with curiosity-seekers of both sexes.

The writer then referred to the various plans that had been suggested to ventilate and disinfect the sewers of cities, and although the subject had occupied the attention at various times of some of the most distinguished chemists, medical and scientific men of this country and Europe, no plan had been proposed, so far as known, sufficiently effective to warrant general adoption.

The debate succeeding the reading of the paper was animating and prolonged. Dr. Preterro said he had visited the Paris sewers and could corroborate what the paper had stated as to their thorough ventilation, etc. No foul odors were perceptible in them.

Mr. J. Harrison spoke in favor of the sub-sewer system, and stated that in the vicinity of Canal street the water at high tide rose to within two feet of the surface of the street, and that the walls of the basements of the houses were at such times damp and almost dripping with moisture. He also stated that at present when the tide recedes it leaves a deposit of sand in the sewers which is very difficult of removal, and at the same time it carries off the fertilizing materials of the sewage, both of which would be obviated if the system of sub-sewers were adopted. The sewage matter could also be better collected.

A member said: When the tide rises the foul gases are forced through the traps and the atmosphere contaminated thereby.

Mr. Capen thought that with the sub-sewerage system the sewage could be passed through materials that would absorb its fertilizing properties, and the remainder could be discharged in the river.

Dr. A. W. Hall thought a better plan would be to let the sewers remain as they are, and pump water from the rivers into elevated reservoirs, to be used for washing the sewers when the tide was low.

C. Williams said if the sewers were above high tide this plan might answer, but would be ineffectual when this was not the case. The sub-drainage system ought also to be adopted for draining the lowlands and marshes in the vicinity of the city of New York.

Wm. B. Harrison said he had seen molasses, made from sorghum grown on land manured with sewage, totally unfit for use on account of the odor pervading it.

Dr. Hall had seen vegetables tainted in the same manner.

Joseph B. Lyman said the best writers and agriculturists acknowledge the value of sewage as manure when properly treated; the results mentioned arose from the want of preparation of the sewage. When mixed with swamp muck it becomes completely inodorous. He was unwilling an impression should go forth from this Society opposed to the utility of sewage as a fertilizer. The sewers of our cities were continually carrying the fertility of our soil into the rivers.

In accordance with the rule which allows a brief consideration of inventions brought to the notice of those present, Dr. A. W. Hall, of New York city, explained his improved water meter, in which a portion of the water is measured to ascertain the whole. A gentleman also exhibited a new derrick, in which the handling of the lifting bucket is facilitated by means of a counter weight action on the rope, which lifts the same.

After some miscellaneous discussion, and the announcement that at the next meeting the subject for discussion would be, "Railway Accidents and the Means of Preventing them," the Society adjourned for two weeks.

A Solid City Front.—How San Francisco will look, and what the city front will be like when the sea-wall now in progress of construction under the Onlton Act, is of interest to the city as well as to the State, and to the commerce of the Pacific. Stone piers are unfortunately not provided for under the act, and it remains to be seen whether the San Francisco merchants are public-spirited enough to take such steps as will insure a solid construction in that particular, before conflicting private interests shall bar the way to the fame of our city as the commercial metropolis of the "great ocean." We will do well to model after other cities than New York. Interesting data concerning the sea-wall will be given in these columns next week. It has reached a point nearly opposite the foot of Clay street, and will be completed to a point off the end of Market street wharf by the 1st of May, 1869. About one hundred men are at present employed on the work.

German Association of Civil Engineers. This organization has shown signs of considerable activity within a few years. At the Paris Exposition they were ably represented, and had an office in a yellow railroad car, where engineers from other nationalties were wont to frequent. A meeting of the Association of Engineers was recently held at Dusseldorf. It numbers 1,500 members, of whom about 500 were present. Among the most important motions was one to the effect that a series of experiments on a very large scale should be undertaken with a view to the investigation of the whole subject of the bursting of boilers, and the means for its prevention.

Water Frontage at San Francisco.—The survey of the tide lands belonging to the State along the city front is advancing. The tracts of the railroad companies have not yet been located finally, because the claims of private individuals of prior date must first be examined and adjudicated. The depth of the water is found at points one hundred feet apart each way, and the depth of the mud and quality of the bottom are also ascertained. The first sales will probably be made in January. North of the Protrero, very little, if any land will be sold; and between the Potrero and Hunter's Point there will be a hundred acres or more. The Board have not decided whether they will sell anything east of the northern half of the Islais bridge; they may make a reservation there for public purposes. The probabilities are that most of the land to be sold will be about Hunter's Point, where the shallowness of the mud, the solidity of the rock bottom, and the abundance and proximity of rock suitable for filling, will command high prices from persons desirous of getting lots on a deep water front with a bottom hard enough to support heavy brick buildings without expensive piling.—*Alta.*

W. F. Boardman is getting out a large, fine map of Oakland and vicinity.

S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, Nov. 21, 1868.

Notices to Correspondents.

ENGINEER.—From the experiments of Gay Lussac, it has always been considered that a cubic foot of water is convertible into 1,689 feet of steam, at a temperature of 212°, the barometer standing at 29.9 inches. Watt conceived that the bulk of steam so formed equaled 1,800 times that of the water employed, and others have gone far beyond the estimate of Watt; Gay Lussac's estimate, however, is considered to approach the nearest to accuracy. In a rough way it is customary to estimate a cubic inch of water as capable of being formed into one cubic foot, or 1,728 cubic inches of steam, at ordinary atmospheric pressure. Other liquids form different volumes of vapor; alcohol yielding 493 times its volume, ether only 212, and oil of turpentine 192, each at the temperature of 212°.

PISCATOR, Marin County.—Certain fresh and salt-water fish become luminous prior to putrefaction; of the former tench and carp; of the latter, the herring and sole are amongst the most remarkable for exhibiting this phenomenon. Lobsters and and crabs also sometimes exhibit a rich phosphorescent appearance. The experiments of Canton and Holme showed that sea-fish became luminous in about twelve hours after death, that it increases until putrefaction is evident, after which it decreases. Immersion in sea-water does not affect this luminous matter, but the brine is itself rendered lumiuous. It is extinguished by pure water, and by a variety of substances which act chemically upon the animal matter. The ligamentous parts are more luminous than muscular fiber; especially the eyes. Phosphorescence is not so frequently seen in the flesh of quadrupeds, and never in that of birde, under any circumstances of decomposition. Carp and tench might easily be introduced into our fresh water bayous, where they would no doubt flourish amazingly, and add greatly to the picatorial luxuries of our tables.

SATURN.—Liquids by combination sometimes produce solids, and solids occasionally produce liquids. If a strong solution of chloride of calcium is mixed with one of carbonate of potash, and well shaken, it rapidly concretes to a solid. A mixture of *pure* alcohol added to a saturated solution of sulphate of magnesia, congeals into a crystallized solid. When the solid amalgam of lead and bismuth are triturated together, they assume a liquid form, and become cold.

JUVENIS.—The founder of the atomic theory was Dr. John Dalton, a native of Cumberland, England, but who spent the bulk of his life and ended his days in Manchester. His life was almost unmarked by any special external events—the main incidents being mental efforts eventuating in signal discoveries. Dalton, in early life, grappled with several fundamental problems associated with the philosophy of heat and meteorology, and developed these favorite speculations during a long life.

J. P. T., Snowy District, next week.

Chemical and Metallurgical Establishments.

THE SELBY SMELTING WORKS AT NORTH BEACH.

At the point of the sandy promontory which terminates North Beach toward the west, there is a plain, though not unshapely, redwood structure, covering with its wings a good deal of ground, but having neither windows nor doors, so far as is visible to the passer-by. To offset this architectural shortcoming, there is, however, a tall chimney. Whether the latter is the ordinary means of ingress and egress to those employed in the place, remains a question of doubt to the adjacent community of wool manufacturers, and to the soldiers and bathers whose curiosity has been awakened by the mysterious circumstance.

That chimney has been smoking nearly all summer,—the works having been erected last year. We are able to state, too, that there *is* a door to the establishment, and that the alchemists inside, though engaged in extraordinary manipulations so far as the experience of this coast is concerned, and consisting of Caucassians and Mongolians, are not unlike other mortals, and are only engaged in the common pastime of making money.

This they do differently from most of us, viz: by washing and dressing "rock," which is brought thither in vessels, and then smelting the same into bars of silver and gold, and of lead. It is an easy process to comprehend when seen, but a very difficult one to begin and to carry on in such a manner as to make it pay more silver and gold than it costs.

The chimney, which is seen belching forth white smoke both night and day, has connection with a number of reverberatory furnaces in which the aforesaid work is accomplished, in a number of very widely differing processes, referring to the metallurgical principles employed. The principal smelting furnace receives all the raw ores after they are washed and dressed. It is by means of the high chimney that the great heat is attained, which could otherwise only be secured by means of a blast engine to blow the air into the furnace, and which would then be built up like a vertical shaft, and called a cupola; while the reverberatory furnace is a horizontal hearth, like a bake-oven, having the flames striking in at one end, and reverberating from the roof to the ore.

Difficult smelting ores when not in a position to be mixed in the charge with others more easily smelted, are usually treated in the cupola. Such are the argentiferous ores containing zinc blende and the sulphurets of copper and iron, while the easily smelted are galena and carbonate of lead. The rich silver ores,—silver glance, brittle silver varieties, and chlorides, and the free gold ores,—are most economically amalgamated, though not till after volatizing the sulphur and antimony contained in some of them, by roasting; while galena fahlerz (argentiferous gray copper), and some other ores, having refractory mineral admixtures, can only be smelted, or chlorinated, or lixivated by other well-known processes.

The simplest metallurgical process in the world is the roasting of silver ores to a stage when the silver is recognized to have become sulphate of silver, leaching the metal out with hot water, and precipitating it to the bottom of the tub in the form of a white cement of pure silver, by throwing in pieces of copper. But practically such simple and economical processes will not always work, because all the circumstances have to be favorable; and we are obliged to come back to the inexorable reducer of all refractory things—fire.

In smelting in general there are two chemical operations at the bottom of everything: reducing (divesting the ore of its oxygen, as seen in its "rusted" state), and oxidizing again those ingredients that are to be got rid of. During these processes a difference of specific gravity, or fluidity, or time of crystallization, or volatility, are made use of, by means of an intimate knowledge of the nature of all the different ingredients to be treated under these different conditions, for the separation of the metals desired.

As little besides galena with a little native red oxide of lead, are smelted from a raw state at North Beach, the process in the reverberatory furnace is an easy and simple reducing process; and the brittle lead obtained is put into a lead refining furnace, where such conditions are brought to bear as will oxidize the antimony, zinc and arsenic, which, in their oxidized state, are easily drawn off from the surface with a wooden block. The hard or brittle lead from the Montezuma Smelting Works at Oreana, Nevada, of which an immense amount is on hand for treatment, enter the lead refining furnace with the products of the reducing furnace.

The next process to which the product is submitted, is one of concentration; making one kind of lead product richer in silver, and another poorer; the object being to save the cost of cupelling the entire bulk of lead, which is sometimes of an average too low in silver to pay. In pattisonizing, which is done in a row of kettles at a low temperature, it is the poor lead which first crystallizes, and the crystals sink to the bottom, whence they are gathered in a ladle holding a quarter of a ton of crystals, and put into the next kettle. By means of a useful mechanical contrivance on a railroad track, invented by Prof. Price, the severe and costly labor connected with this process is avoided.

Finally cupelling, or the oxidizing of the lead to separate it from the silver, is done on the English portable hearths, which are small, but clean, neat in their manner of working, and easily kept in proper repair. The oxidized lead flows off from the surface of the metallic bath like water, but the moment it cools it assumes a scaly or powdery form, and it is the minium or red lead of commerce. A beautifully pure oxide of lead is produced at these works, and a market has been found thus far for all that has been produced. Should the market get overstocked, the oxide can easily be reduced to metallic lead.

Rich amalgamation and other products which cannot be brought to a perfect separation by the dissolving agency of volatizable quicksilver, also receive the attention of Prof. Price, but in most cases it has been found better to send such products to Swansea. Railroad communication in the interior of Nevada, and Idaho, and Utah, will undoubtedly bring quantities of refractory material to this city, and it will be skillfully and economically treated here as soon as the occasion shall demand it.

Silver and gold refining—the separation of copper, bismuth, etc., from the silver, and the silver from the gold—are done by different processes, and in different establishments specially arranged for the purpose; such as Kellogg & Hewston, and Judson's Refining Works, which will be referred to hereafter.

BLAKE'S STONE-BREAKER IN SOUTH AFRICA.—The London *Mining Journal* of Oct. 3d, says: "It is proposed to send this machine to the newly-discovered gold fields of South Africa, where its great simplicity, the small amount of power it takes, and the large amount of work it will do, are sure to cause it to be thoroughly appreciated. The English manufacturer has received a testimonial that one of his machines is now crushing hard ores at a cost of only 1 ½d. per ton, including steam-power, labor, and oil."

CLEAR WEATHER AND CRISP FROSTS are delights of the present season, enjoyed by all who get beyond the range of walls, or who go into the hills.

The Electric Theory of Earthquakes.

A lecture was delivered by W. H. Rhodes, ("Caxton") a lawyer of this city, at the Mercantile Library, on Thursday evening, in support of the electric theory of the cause of earthquakes,—which seems to be somewhat in favor at present. The lecture was an agreeable entertainment; the speaker's style being excellent, and the reasons in favor of that hypothesis having been presented with all the attractions that a fine command of language could add to the subject. Being a theory entirely disregardful of the opinions held by geologists,—it was first advanced many years ago by a philosopher whose name and identity we are not now able to recall,—a considerable audience was present for the purpose of hearing what could be said in its behalf, or perhaps in favor of any other unexploded theory which might offer itself as a substitute for the generally accepted opinion, or as an addition to our present unsatisfactory knowledge of that subject. Many interesting points were presented, the correctness of which will be very easily decided upon by that class of philosophers with whom earthquake theories are a matter of *taste*. We will attempt merely to state the arguments advanced.

Mr. Rhodes maintained that the attraction of gravitation is at the bottom of earthquake causes; the periodical conjunction or opposition of the moon and planets creating electric storms, of which earthquakes are the manifestations. He attempted to show that such astronomical and earthquake periods have been coincident during a century or more. The greatest attractive influence of the moon and planets can be estimated mathematically, but in designating earthquake periods, extended data would be obviously requisite, embracing the world at large; and similar astronomical conditions should unfailingly produce the same terrestial results. The "electric belt which swells up at the equator," or the spheroid form of the earth, owes its cause, in the opinion of the lecturer, to the attractive force of all the planets in the ecliptic, which are directly faced by the equatorial enlargement, and centrifugal force has nothing to do with it;—thus accounting for the fact that earthquakes are more frequent or more terrible in the tropics than elsewhere. Volcanoes were created by the electric fluids of the interior, which must have a vent. Amongst the reasons given in support of the electric hypothesis, were the twisting motion given to chimneys; the fact mentioned to him by Capt. Wilder, that in a mine at Copiapo, no oscillation was felt, while on the surface they experienced an earthquake; and a similar experience was related more recently of the workmen at Lime point, who were only 200 feet under the surface, in a tunnel; the twisting around each other of two telegraph wires at San José; the peculiar meteorological phenomena accompanying earthquakes, such as the smoky atmosphere and the glassy sea; the disturbance of the direction of the magnetic needle, observed on board a Russian frigate, and elsewhere; the thunder and electric phenomena connected with the eruption of Stromholi; the immense extent of country affected by a single shock; the subsidence of earthquake influences during periods when the aurora borealis is prominent, the latter apparently relieving the earth of its causes of disturbance; the paralysis of the arm of an acquaintance at Oakland, during the late earthquake, who "distinctly felt the magnetic shock passing out at the ends of his fingers;" and the profuseness of electric sparks flowing in a constant stream from the hair of a lady in this city on the evening before the late earthquake, (12 hours earlier) the same ceasing to be evolved after the shock. The lecturer concluded by assuring the audience that no severe earthquake would occur again for about a cen-

tury, after the present winter, except perhaps, some slight shocks when the sun's spots should attain their maximum size in 1878-9; because a period of auroras was to set in after the present winter, according to Prof. Lovering, which would last for twenty-two years, when there might be some additional slight shocks.

That the needle has been disturbed in its direction during an earthquake shock, appears to be a well attested fact, whatever may be the correct explanation. The lecturer did not attempt to explain how it is that earthquakes are restricted to the vicinity of the peculiar volcanic lines and centers of the globe (including Iceland, Alaska, and the Austral continent), in relation to which their localities of occurrence and relative frequency and intensity, have been mapped with great care by Mallet and Humboldt. But if volcanic pheuomena are attributable to electricity, and if the spheroid form of the earth is due to attraction of gravitation, there would probably be no difficulty in reconciling also this fact with the electric philosophy of earthquakes.

Another lecture on the subject of earthquakes was delivered on Wednesday evening, by Capt. W. A. Hutchinson, at Dashaway Hall.

Encouragement to Home Inventors.

There are no people in the world who think and act quicker than Californians, and this State, in proportion to its population, is now furnishing a greater number and variety of novel inventions than any other in the Union—Yankeedom not excepted.

During the year 1868, no less than 300 applications for patents have been made by Californians, and the number granted will reach about 250. Probably in no other State in the Union do inventors receive Letters Patent for over two-thirds the applications made. The remarkable success of California applications is by reason of greater originality in our Pacific Coast inventions, and the thorough manner in which the claims for the same have been presented to the Patent Office.

Among the notable patents granted to Californians in 1868, may be mentioned the Steam Plow, which, it is believed, will be able to plow and sow twenty acres per day; the Railroad Constructor, which will lay seven miles of track per day; a new explosive compound, which is cheaper, less dangerous, and 100 times more powerful, than common gunpowder; and a machine gun, which loads itself and fires 120 shots per minute. Patents have been applied for in foreign countries for the above inventions, with one exception,—and in one case the applications extend to every important civilized country in the world. Foreigners and adopted citizens share alike the protection granted by United States Letters Patent, and we are indebted to them for some of the most useful improvements of the past twelve months. One quite ingenious invention has been brought forward by a son of the "Flowery Kingdom," who is probably the first Chinaman that has signed a petition to our Government for a patent.

When in Washington last winter, one of the proprietors of this paper made special arrangements with the Patent Office for weekly reports of patents issued to inventors of the Pacific States and Territories, to be advanced to us everland, and for which we have to pay a liberal price to the Government. In order that inventors may at once be notified, and the interested public informed of all new and useful patents, we have given the lists over to the daily press, enabling them to publish it in advance of our weekly issue. The attention which the press throughout the State has given to this weekly list of patents, shows what friendship and interest the editors and publishers of California entertain for home inventors and inventions. This is right and generous, and friendship well bestowed. There are no nobler men, as a class, than real inventors. They help the world along—let us help them.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

MINING AND SCIENTIFIC PRESS

DEWEY & CO., Publishers,

Office, 414 Clay St., below Sansome, San Francisco.

Subscribe for the Mining and Scientific Press.

The PRESS was established in 1860, and has been enlarged from time to time, until it now contains sixteen pages—size of *Harper's Weekly*.

It is printed on extra quality of paper, rendering it a handsome volume to file for future use.

A large amount of editorial labor is constantly expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations are given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number treats carefully on subjects of home trades, manufactures and domestic economy.

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States and Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks are quoted; also the produce and market rates, metal market and prices of copper ores.

"Answers to Correspondents" afford much of interest to readers and of advantage to the community.

The Mechanical and Scientific Miscellany contained on a single page of each issue we are frequently told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber an hundred fold the cost of a year's subscription.

The PRESS, as a mining and mechanical journal, has met with unrivalled success.

Sample copies sent free on application.

Subscription, $5 per annum.

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To ENGRAVING and ELECTROTYPING, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

The Best Advertising Medium on the Pacific Coast.

Our terms for advertising in the MINING AND SCIENTIFIC PRESS are very low considering its wide circulation among the most intelligent and industrial classes

☞ All advertisements inserted in the PRESS are contained ☞ in the MONTHLY SERIES of the MINING AND SCIENTIFIC ☞ PRESS, which (by special arrangement) are placed for ☞ FREE READING in the principal hotels, steamboat and ☞ steamship saloons, depots, and public libraries in San ☞ Francisco, and the Pacific States. Many volumes are ☞ also bound, thus affording permanent advertising.

DEWEY & CO.

A BUSY MAN is a locomotive, and life a track. Every night he drives into "the house" and stops. Every morning he is fired up anew, and away he goes, switching off in one direction and then in another. In this routine of business he forgets that the physical organization is of the most delicate kind. If a hard iron locomotive needs constant care, and to be well oiled up and rubbed off every day, how much more necessary is it that all men and women should use PLANTATION BITTERS, which are the *ne plus ultra* of everything which is necessary to keep the system in a perfect tone of health.

THE FIRST VELOCIPEDE.—A sensation was created on Fifth street, in this city, a few days ago, by the appearance of a velocipede propelled by a gentleman who seemed perfectly to understand the machine.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

1 T
will heal
old sores, piles,
ulcers, cancers,
salt rheum, and breaking out on any part of the
body, and also removes pain
of every name or nature instantly. It is a harmless liquid, and leaves
no smart or stain, and is called Moore's
Pain Paint. For catarrh and colds in the
head, Moore's catarrh remedy affords a safe,
sure and speedy cure. Both remedies sold
by druggists every where, and at Moore's
office, 589 California street, northeast
corner of Kearny, where all pain
is instantly removed, free
of cost, as hundreds can
now testify from actual tests.

DR. NESTELL'S LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,

For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.

Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.

Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.

Invalids at a distance, on writing their case, can receive the remedies by Express.

Special attendance out of the city will be charged commensurately with the time and distance occupied.

All communications must be addressed to

ELECTROTYPE ENGRAVINGS, CUTS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Geantae White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

DISPERSION OF CAPITAL.—For several years past there has been a strong tendency to concentrate capital in San Francisco and employ the greater portion of it in real estate transactions. The city was growing out of all proportion to the State at large until steamship opposition gave us a materially increased immigration, and the remarkable prosperity which attended our agricultural interests for the past two years induced the cultivation of a much extended area. The rage for buying land in and about San Francisco, and erecting shell edifices to secure quick, high rents, was the ruling passion to the exclusion of outside ventures. * * * Real estate investments have proved very lucrative. Men could turn their money over more frequently than in most other business, and the inducements were altogether too captivating to be resisted. But everything has its limit, and in this case that limit has been hard pressed in anticipation of the Pacific Railroad completion. Everything in the shape of land for thirty miles in all directions has been cut up into building lots and offered in the market. An area big enough to contain twenty such cities as New York has been parceled out in "Homestead" lots, apparently with the expectation that they would find ready sale, and he settled upon by the overwhelming tide of immigration expected by the overland facilities to be furnished in six months from this date. * * * True policy would indicate that some of our abundant capital should be converted to other and more permanent interests, even though more time be required before substantial returns can be had. We require a net of railroads connecting us with all the main agricultural districts and the principal mines. We need to establish factories of various kinds upon all our mill privileges, and afford them ready access to market. If we desire to keep the heart healthy and vigorous, we must not neglect the extremities, much less the main arteries. It is possible that the recent earthquake may induce a more careful attention to other and no less important interests outside of San Francisco. If so, it will only hasten what will have to be done at some time, and those earliest in the field will have the best chance.—*Commercial Herald.*

CANOE NAVIGATION IN BRAZIL—NOVEL LAND CARRIAGE.—A Paraguay correspondent of the St. Louis *Republican* says: Canoe life is a distinct feature in a country where there are few roads and many rivers, as in Brazil. Almost every man, woman and child is expert in managing a canoe; and it is surprising what skill the natives have in fashioning the log by the eye alone into the most methodical dimensions and symmetrical forms. These water craft are of all sizes, from a horse trough to the pirogues of war of the old Tamoias, which were of such notable grandness that they carried 150 warriors, who shot their arrows with one hand while they rowed with the other, making the wood of the oars their shields. The canoes of Ignape river are yet more immense, as the largest trees along the coast are found up that river. For land carriage there is a contrivance in many parts of Brazil which I do not remember seeing mentioned, and which has great conveniences for invalids or persons who consult their ease. It is the *bangue*, something like the palanquin or palkee of India or China—only that, instead of being carried on men's shoulders, it is swung between two mules, the forward mule being led by a footman, and being harnessed with the long front shafts of the hangue playing up and down in harness on his side; and the hinder mule, accoutred in the same manner, only reversed, "the cart before the horse." Or, in other words, it is a hand-harrow carried by mules—the handharrow curtained off like a bed, in which one or more persons can lie and sleep, or sit and smoke and read, passing along over any roads that a pack-mule can pass with his load, the play of the shafts keeping the hangue always pretty much horizontal and jogging along over very rough ground with comparative comfort, and it affords convenient night quarters in case of camping out along the route, and families of the better class are frequently seen journeying in this manner in the province of St. Paulo.

THE WORLD'S BENEFACTORS.—Lehlanc, the inventor of the process now in common use for making carbonate of soda from common salt, which, after eighty-six years, remains as he left it, remained poor, although he had been the agent of conferring incalculable wealth upon mankind. Cheap soda, cheap glass and soap, light and cleanliness, and their collateral benefits, were due to him; yet he wanted bread, and ended his days in a hospital, having lingered there, when fortune, health, and hope were lost, until reason also failed, and he died by his own hand.

SEPARATION OF THE INNER BARK FOR TANNING.—The tanning principle being found chiefly in the inner bark or "liber," and a large portion thereof absorbed by the outer bark or "ross" in the bleaching process, it is suggested that an improvement on the present plans would be to first separate the ross from the liber, by means of some efficient, portable machine, and, after grinding the liber in a dry condition to a fine powder, to compress it by suitable power into barrels or boxes for transportation to the tanneries. This would not only secure the least bulk and consequently the least expense for carriage, but the entire quantity of tannin in the liber would be placed in an available form in the hands of the tanner. In carrying out this system of preparing the bark for use, however, great care would have to be taken in keeping the powdered material perfectly dry, for the presence of moisture would enable it to absorb oxygen, thus converting the tannin into gallic acid, which is of no value in tanning operations, except in a minor degree as assisting the "swelling" of the hide, or, in other words, the extension of its fibers.

RELIEF-PRINTING BY PHOTOGRAPHY.—The *Gentleman's Magazine* describes a new English patent for relief-printing by photography: A drawing is made in line or stipple, and a negative photograph is taken from it. This is used to print, photogenically, upon a well-known film of gelatine mixed with a chromic salt, which gives an impression with the whites of the picture in intaglio and the lines in relief. A plaster cast is taken from this matrix, and a type metal cast from the plaster. This last is touched up, if necessary, and mounted, like a stereotype, for printing. A manifest advantage of the method is that it allows the block to be produced upon any scale relatively to the original drawing. The first specimens produced are said to have had the wiriness of an etching, wanting the tone of wood engraving.

THE RING AROUND THE SUN.—Professor Loomis, of Yale College, in his recently published treatise on Meteorology, speaking of the halo around the sun, says: This is formed by the refraction of the light of the sun or moon through crystals of ice floating in the atmosphere. Snow consists of crystals of ice. Whenever halos are formed about the sun, the air is filled with fine prismatic crystals which occupy every possible position with respect to the sun's light. Such a halo may be formed in midsummer, because at a moderate elevation above the earth's surface the condensed vapor of the air is frozen even in the hottest weather. The circle within the halo is much darker than the space without it, because from no part of this circle can a ray of the sun retracted by ice prisms reach the eye of the observer.

RATES FOR ADVERTISING

VERY LOW.

A NEW PAPER

Will be published on SUNDAY NEXT, November 1st, to be called

THE SPIRITUAL LIGHT.

Published (for the present) Monthly.

It is especially designed to promote the cause of SPIRITUALISM, and assist in the discussion and investigation of all subjects pertinent thereto; which will naturally include Religion, Philosophy, Ethics, Morality and Universal Liberty.

TERMS OF SUBSCRIPTION.—One copy 1 year (invariably in advance) $1; Three copies to one address 1 year, $2 50. For convenience of remission, Greenbacks will (for the present) be received at $1 25 to the dollar in gold—we hope soon to be able to receive them at par.

TERMS OF ADVERTISING.—One square, one insertion, $1 (equal to 10 lines of ordinary brevier type); One square 3 months, $2; One square 1 year, $5; One column, 1 year, $25; do. 6 months, $15; do. 3 months, $10.

A copy will be sent gratuitously on application to the publisher, to all places where one cannot be seen at the Bookstores. Address GEO. G. W. MORGAN, Editor and Proprietor, 472 Harrison street, between Third and Fourth street; or, 1578 Post Office, San Francisco. 18v17t

OIL STOVES!

MORRILL'S

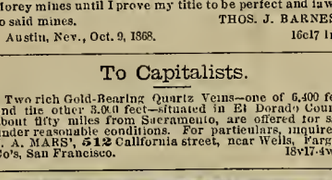
Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of **$100** for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16 3m



NOTICE.

TO ALL WHOM IT MAY CONCERN.—Notice is hereby given, that I am the first discoverer, first locator, and first Recorder of the Morey District, Nye County, Nevada, and I warn all persons from buying any interest in the said Morey mines until I prove my title to be perfect and lawful to said mines. THOS. J. BARNES.

Austin, Nev., Oct. 9, 1868. 16c17 1m

To Capitalists.

Two rich Gold-Bearing Quartz Veins—one of 6,400 feet, and the other 3,000 feet—situated in El Dorado County, about fifty miles from Sacramento, are offered for sale, under reasonable conditions. For particulars, inquire at J. A. MARS', **512** California street, near Wells, Fargo & Co's, San Francisco. 18v17-4w*

Brass and Steel Stamps and Dies, **522** Montgomery street, San Francisco. Orders by express promptly attended to. 6v16

DESKS AND OFFICE FURNITURE.
JOHNSON & BEST,

Manufacturers of all kinds of

Desks and Office Furniture,

717 Market street, near Third.

Warerooms up stairs. A large variety of Desks always on hand; all kinds of Office Furniture and Cabinet Work made to order. 18v17qr

LOOK TO YOUR ROOFS!
Pacific Concrete Company,

No. 622 Clay street,

Factory on Kingsstreet, between Third and Fourth street.

New roofs covered and leaky roofs repaired, in thorough and substantial manner, promptly and at very reasonable rates. Proprietors of Eagau's Patent. 18v17tf

Pacific Chemical Works.

SULPHURIC ETHER.
SPIRITS OF NITRE,
AQUA AMMONIA,
ACETIC ACID,
CYANIDE OF POTASSIUM
—AND—
ACIDS AND CHEMICALS OF ALL KINDS.

FALKENAU & HANKS,
Office, 619 Montgomery Street.

LOUIS FALKENAU, State Assayer.

☞ Particular attention paid to the Analysis of ORES, MINERALS, METALS, etc. 8v17

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at **11** o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillio. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR NOVEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

Nov. 6th—CONSTITUTION.....Captain W. H. Hudson, Connecting with ALASKA, Capt. Gray.

November 14th—GOLDEN AGE.....Capt. W. F. Lapidge, Connecting with OCEAN QUEEN, Capt. King.

November 21st—COLORADO.....Capt E. S. Farnsworth, Connecting with HENRY CHAUNCEY, Capt. Connor.

November 30th—SACRAMENTO.....Capt. W. H. Parker, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on SATURDAY, October 3d, at 12 o'clock M., from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant ugencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge*; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

Foreign Patents.

In addition to American patents we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, the Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitously patented in foreign countries, some of which governments allow it, thus debarring those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

Patent Rejections.

FIRST. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittanee, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to he issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the timo at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is tea weeks. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Candid Reasoning.

A gentleman eminent for his ability in all points pertaining to specifications, gives inventors the following sound advice:

To properly prepare a specification may seem a very simple and easy task, but such is not the case. It requires a knowledge of the arts, of science and scientific terms, and their proper use—of mechanics and the principles that govern their action—of law, and of the grammatical and legal force and construction of language, which is possessed by but very few persons.

Lawyers seldom possess tho mechanical knowledge, while meebanics still more generally lack the legal knowledge necessary to enable them to properly prepare a case for examination.

It requires such a *combination* of legal and mechanical knowledge, together with a special knowledge of the principles and rqles that govera the action of the office, that no person is really competent to undertake the business but those who *have made it a study, or had experience at it.* In view of these facts I unhesitatingly advise every person who bas an invention worth patenting to get some responsible and competent ageat to attend to it for him.

No person scarcely would think of entering upon a suit at law without employing a lawyer to attead to it, and make out his papers for him; and if a sensible man would not do that, much less would he attempt to prepare an application for a patent without knowing anything about the business.

I am aware that persons frequently attempt it, but I am also aware that *many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given when once rejected.*

Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their invention, and is therefore useless. It is for this reason that many applicants are compelled to reissue their patents at as great, and often greater expease, than the obtaining of the original.

Hence I repeat, every person having an invention worth patenting should employ a competent and responsible agent—I say *competent and responsible,* for, unfortunately, there are many who are neither competent nor responsible.

If worth filing at all, these cases should be prepared with very great eare and caution.

One intentor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented, or "Patent applied for."

Re-Issues.

When, through "inadvertence, accident, or mistake," an *insufficient* or *defective* patent has been issued, the defects in the Specification and Claims can be cured by a *re-issue.* In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed ia transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Illustrate your Innentiovs.

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and tho cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial paias in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

To Eastern Inventors.

Our close proximity to Mexico, Australia and the Islands enables us to obtain Letters Patent for you with much less *delay* and expense than they can be secured through any other agency in the United States.

Comparatively few inventors seem to be aware that Melbourne, in Australia, is a city nearly double in size to San Francisco, besides the adjacent colonies of great commercial and mineral importance. Inventions of all kiads, but especially those relating to the saving of gold and silver, if secured in Australia, will oftea prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

DEWEY & CO.,
Patent Solicitors, Mining and Scientific Press Office,
414 Clay Street, below Sansome, San Francisco.
SEPTEMBER, 1868.

THE MINING AND SCIENTIFIC PRESS has entered upon its XVIIth Volume. It bas donned a new-style hat; or, in newspaper parlance, a new heading, which givesit the solid, scientific look it merits. Other improvements typo graphical are also noticeable. No call for improvement in its matter.—*Amador Ledger, July 18th.*

Mining Notices.

Cordillera Silver Mining Company, Morelia District, Chihuahua, Mexico.

NOTICE.—There are delinquent, upon tho following described stock, on account of assessment levied on the sixteenth day of October, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Dickson John	147	21	$21 00
Dickson, John	167	5	5 00
Alfred Harris	135	5	5 00
Alfred Harris	137	5	5 00
Alfred Harris	143	8	8 00

And in accordanee with law, and an order of the Board of Trustees, made on the sixteenth day of October, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on Monday, the seventh day of December, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco. no21

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of November, 1868, an assessment (No 27) of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 28 Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the twenty-second day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 28 Merchants' Exchange, south side of California street, between Montgomery and Sansome streets, San Francisco, California. no21

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the thirteenth day of October, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Bradley M.....old issue....	7	30	$60 00
Bradley, A B.....old issue....	56	5	10 00
Ely, I.....old issue....	57	10	20 00
Findley, Thos...new issue....	26	49	98 00
Gray, C M.....old issue....	5	30	60 00
Gray, C M.....old issue ...	6	30	60 01
Gorde, F .....new issue....	10	25	50 00
Knight, D E.....old issue ...	30	54	108 00
Lawson, J F.....old issue...	44	49	98 00
Lamory, E.....new issue....	11	100	200 00
Ruggles, D W.....old issue....	57	10	20 00
Van Muller, E.....	20	150	300 00
Van Muller, E.....	21	104	200 00
Van Muller, E.....	22	57	104 00
Van Muller, E.....	23	25	50 00
Van Muller, E.....	24	20	40 00
Vitte, I.....	55	5	10 00

And in accordance with law, and an order of the Board of Trustees, made on the thirteenth day of October, 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salerooms of J. Middleton & Son, 310 Montgomery street, San Francisco, on Monday, the seventh day of December, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOHSE, Secretary.
Office, 318 California street, San Francisco, Cal. no21

Rippon Gold and Silver Mining Company.— Location of Works: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of of October, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 57 Stevenson street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

P. CARROLL, Secretary.
Office No. 57 Stevenson street, between First and Second streets, San Francisco. oc24

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Saturday, the twenty eighth day of November, 1868, and the sale thereof until Thursday, the seventeenth day of December, 1868. By order of the Board of Trustees.

P. CARROLL, Secretary.
n21

Colorado Silver and Copper Mining Company, Arizon Territory.

NOTICE.—The Annual Meeting of Stockholders of the Colorado Silver and Copper Mining Company, of Arizona Territory, will be held at the Company's office, No. 713 Montgomery street, Room No. 40 (3d story), on MONDAY, DECEMBER TWENTY-EIGHTH, 1868, at 3 o'clock, P. M., for the election of Trustees and the transaction of such other business as may properly come before it.

B. W. MUDGE, Secretary.
nov14

Chiplonena Mining Company--District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of tho Board of Trustees of said Company, held on the sixth day of November, 1868, an assessment of two dollars and fifty cents per share was levied upon tho capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up-stairs, San Francisco. n7

Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of October, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No 49 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall he made before, will be sold on Monday, the twenty eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary.
Office, Room No. 49 Merchants' Exchange Building, California street, San Francisco. oc31

Fogus Mill and Mining Company.—Location of Works: Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of October, 1868, an assessment of two dollars and fifty cents ($2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office in San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twelfth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary.
Office, No. 318 Front street, San Francisco, Cal. oc31

ASSESSMENT NOTICE.

Notice is hereby given, that an assessment of one dollar per share on the stock of the NEVADA COUNTY GOLD MINING COMPANY is due, and payable at the office of the Company, No. 9 Merchants' Exchange, San Francisco, within thirty days from date. Any of the above stock upon which said assessmont shall remain unpaid on Saturday, the 19th day of December, 1868, will be sold at public auction, at the office of the Company, as above, at 12 o'clock, noon, in accordanee with law and per order of the Board of Trustees.

W. AUG. KNAPP, Secretary.
San Francisco, Oct. 19th, 1868. oc24

Mount Tennbo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that the Annual Meeting of tha Shareholders of the above named Company will be held at the office of the Company, No. 426 Montgomery street, San Francisco, on THURSDAY, the twenty-sixth day of November, 1868, at 12 o'clock M., for the election of Trustees to serve for the ensuing year, and for the transaction of other business.

CHAS. F. SCHULZE, Secretary pro tem.
Office, 428 Montgomery street, San Francisco. no14

Scantor Silver Mining Company.—Location of Mine: Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of November, 1868, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourth day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-fourth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. oc7

U. S. Grant Mining Company.—Location of Works: Carlisle, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of November, 1868, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 226 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the second day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ENOS TAYLOR, Secretary.
Office, No. 226 Clay street, San Francisco. nov14

Machinery.

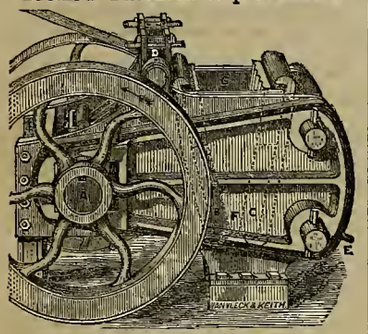
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They will bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—Price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1854. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of Septemher 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

HYDROSTATIC WORKS.

SAN FRANCISCO

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sauders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double-acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this state. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞ This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere. ☞ I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION
PATENT
Variety Molding and Planing
MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

Fire, Hose and Machine Belting.

THE SUBSCRIBER CONTINUES TO MANUFACTURE Oak Tanned Leather Fire Hose, warranted superior to Eastern Hose, manufactured at the Sixth Street Tannery, San Francisco.

21v16tf JOHN J. FULTON.

TWO ROCKS, Sonoma Co., Cal., Sept. 23, 1868.—Messrs DEWEY & Co:—On my arrival home, I found my Letters Patent all arranged to my entire satisfaction. Please accept my thanks for the energy, skill and dispatch with which you procured it for me. In future, should I require assistance in your line of business, I shall most certainly apply to you. Truly yours,

MICHAEL LAUFENBURGE.

THE "SEA SERPENT."—This strange animal, killed near Eastport, has been on exhibition in this city during the past week, (Oct. 8th.) This animal, part fish and part beast, is over thirty feet in length, and girts twenty-one feet. It has one enormous dorsal fin, two side belly fins, and a broad shark-like tail. About one-third of its length from its tail, iu connection with small fins, it has two hugelegs terminating in web feet. Its mouth makes a line of five or six feet in length, the whole extent of which is set with innumerable small teeth, very much resembling in size and shape the kernel of a species of sharp pointed pop-corn. It has a series of gills which overlap each other like the flounces once the style of ladies' dresses. His immense body, which was estimated to have weighed when captured, about eleven tons, has no framework of bones, its most solid portions consisting of cartilage incapable of preservation. Its skin is dark and tough, like that of the elephant and rhinoceros. There is no record of his species, and to none is it a greater wonder than to naturalists whose attention is being drawn to it. Among others who have had an opportunity of seeing it is Prof. Baird, of the Smithsonian Institute, of Washington, who is as yet unable to place it in the known list of the animal kingdom. Wheu first discovered, it was swimming along leisurely, and when pursued took to the land, and when captured was some 120 feet above high water mark. Numerous shots were fired at it, but none took effect until the gun was loaded with a small spike, which took effect, striking just above the main fore fin. On analyzing the stomach, it contained nothing but vegetable matter, which leads to the conclusion that it subsisted upon vegetables on the bottom of the ocean and shore. From this city it will be takeu to Saco, where it will be exhibited for a few days.—*Portland (Me.) Advertiser.*

NEW WAGON BRAKE.—A new wagon brake has beeu invented by J. S. Butler and A. J. Stucker, of Silver City, Idaho, which produces, according to the opinion of the Owyhee *Avalanche*, four times the frictional effect of the ordinary method, upon the wheels of a wagon. It consists of two brake-bars, one behind and one before the hind wheels; and instead of attaching to the axle, as in the old style, and thereby adding to the strain on the spindle (sometimes several tons) the power is transferred through the sandboard, by means of a sliding bar, to the opposite brake-bar, by which it will be seen the effective force applied to the wheel is just doubled. The distance between the points of friction in the old plan is only from the center to the circumference, that is, from the axle to the brake-bar, while in the new plan the distance is the entire diameter of the wheel, or from one brake-bar to the other, thus giving the latter a two-fold advantage. There are also two brake-shoes, or blocks, doubling the friction surface. A small but not unimportant point in this new arrangement is the fact that the muddy portion of the wheels comes in contact with the hind blocks in their upward course, which consequently prevents the accumulation of mud on the top of the blocks. There is but little more wood and from thirty to forty pounds less iron made use of, and the brake is very simple, there being no unwieldy "roller," so that any blacksmith can make it, and at much less cost than the ordinary brake. A patent for this invention has been applied for through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

RHODE ISLAND IRON.—In the old French war, a century ago, iron was taken for casting ordnance from the ore beds of Cumberland, R. I. This mine has been abandoned for many years. Of several analyses noue has shown less than 33 per cent. of metal even in the surface rock. The ore contains no sulphur or phosphorus, but has alumina, silica, magnesia and manganese, with a small percentage of titanic acid, which last is believed to add to the value of the iron. Extensive peat beds are found near the mine, and limestone is abundant in the region. The Newport coal, which has been found peculiarly advantageous for smelting iron, can also be very conveniently brought to the place. The surface ore is now shipped to Pennsylvania in large quantities to be mixed with the ores of that State.—*Stockholder.*

POPULAR AND SCIENTIFIC LECTURES.—A course of twelve lectures will be delivered by leading professional men of this city on popular subjects, before the Young Men's Christain Association. The admission fee will be $1.50 for the course.

A Slate House—Earthquake Proof. While the problem of earthquake-proof houses is receiving attention, the description of a slate house, built at Brownsville, Maine, by a N. Y. *Evening Post* correspondent, is to the point:

This house is not only shingled, but is clapboarded with slate. It is a slate edifice, fire-proof and indestructible. The slates are put on to the boarding of the walls with only paper between. They are in the form of segments of a circle, overlapping each other, and have a very ornamental effect. The natural color of the slate is pleasing to the eye, and no paint is needed. If it were, the slate would furnish it, for when ground it makes an excellent paint, which Mr. Sparrow has used on his barn with good effect. The whole establishment is elegant in appearance, and shows what can be done with native materials. The front steps are of beautiful slabs of slate; the wood-work is of brown ash, a native wood, which makes a handsome finish.

Iron in Canada.—At Moisie River, in the Province of Quebec, on the north shore of the St. Lawrence, a company is working on a large scale alluvial deposits of magnetic iron sand. H. Beanmont Small, in a work recently published at Ottawa, Canada, entitled "Products and Manufactures of the New Dominion," says that the sand used by the Moisie Company yields fully sixty per cent. of malleable iron, and that tests made by the superintendent of the West Point Foundry show it to be of very superior quality.

Development of the Northwest Coast. Geo. H. Atkinson, of Portland, Oregon, recently spoke to the Boston Board of Trade, concerning our northwestern forests, fisheries, and mineral and agricultural resources. It is expected that many of the New England coast people will find their way hither speedily, to develop our northwestern coast resources.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets,

SAN FRANCISCO.

By a process entirely new, the proprietor is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.

2d. It is the best and purest material known in the market, being entirely free from all offensive smell.

3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.

4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.

5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.

Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulu, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v166m

PATENT CANS.

6v17-tf. **414 Front street**, San Francisco.

The Mining and Scientific Press, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the Press is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on i subscription books. *Nevada Gazette.*

BUERK'S

Watchman's Time Detector.

This watch-clock was introduced to the public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞This Detector is covered by two U. S patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address

J. E. BUERK, Proprietor,
47 Congress street, Boston.

P. O. Box, No. 1057. 23v16-6m

The Mining and Scientific Press comes to us this week in a new dress throughout, much improving its appearance. The Press is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

Metallurgy.

KUSTEL & HOFMANN,

Metallurgists and Assayers.

Gold and Silver Bullion Assayed.

MINERAL ASSAYS & ANALYSIS MADE.

611 Commercial Street, San Francisco.

SILVER AND GOLD ORES worked in small lots up to hundred pounds, by Chlorination and other methods. 18v16-tf

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.

San Francisco March 6, 1865. 11v10-tf

PROF. HENRY WURTZ,

Formerly Chemical Examiner in the U. S. Patent Office, may be employed professionally as a Scientific Expert. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3,30. ☞Written communications preferred.

Important to Gold and Silver Miners and Companies.

PROFESSOR WURTZ,

Who is the Inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address information in relation thereto, together with experimental packages of

SODIUM AMALGAM.

All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17

G. W. STRONG,

ASSAYER AND WORKER OF ORES,

No. 10 Stevenson street, near First, San Francisco.

Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms. 14v16qr.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA!

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

PROFESSORSHIPS IN THE STATE UNIVERSITY.—The Rev. O. P. Fitzgerald, Chairman of the Committee on Instruction of the Board of Regents, reported in favor of the appointment of the following as instructors:

1. Professor of Mathematics.
2. Professor of Physics and Industrial Mechanics.
3. Professor of Ancient Languages.
4. Professor of Chemistry, Mining, and Metallurgy.
5. Professor of Modern Languages.
6. Professor of Agricultural Chemistry and Horticulture.
7. Professor of Civil Engineering, Architecture and Military Science.
8. Professor of English Language and Literature, including Rhetoric and Logic.
9. Professor of Geology, Botany, and Natural History.
10. Professor of Intellectual and Moral Philosophy, and Ancient and Modern History.
11. Drawing.

One of the Chairs is to be filled by the President.

Professor John Le Conte, of Columbia, South Carolina, was elected Professor of Physics, having been strongly recommended by distinguished men of science in the East. His salary was fixed at $3,600 per year; that of the President being $6,000.

FORTHCOMING REPORT ON THE ECUADOR EARTHQUAKES.—The Chilean Government proposes sending a scientific commission to study the earthquake phenomena of Ecuador. If they deal in nothing but facts, put together clearly and compactly, the results will be valuable. The data may thus be furnished on which any one can base a correct judgment concerning earthquake phenomena.

THE CALIFORNIA TOOL WORKS, I. Weichhart, proprietor, has been removed to No. 143 Beale street, near Howard. Connected with these works is a blacksmith and machine shop, so that quite a variety of work is done, more particularly in the manufacture and repair of different kinds of edge tools. The attention of miners, mechanics, and farmers, is called to the advertisement, which fully sets forth the nature and character of the business. *

AMERICAN
(WALTHAM)
WATCHES,
THE BEST!
THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 320,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

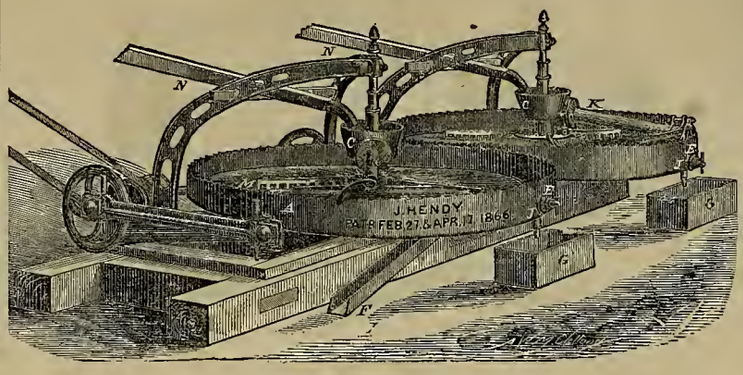
A custom-house duty of twenty-five per cent. payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.



There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first class dealers in the United States and British Provinces.

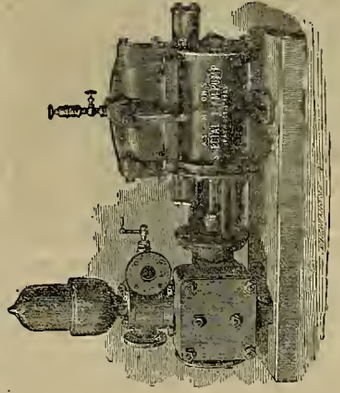
PREMIUM FOR BEST CONCENTRATOR
AWARDED BY THE
MECHANICS' INSTITUTE, 1868
ALSO AT THE STATE FAIR FOR 1868,
To J. HENDY.

A LARGE NUMBER OF THESE
IMPROVED CONCENTRATORS,
ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.



By recent alterations in the patterns for these machines, they are now made
Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

At the lowest Market Prices.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

AGENTS WANTED FOR
SUNSHINE AND SHADOW IN NEW YORK
Matthew Hale Smith's New Book.

This is the most popular work ever introduced on the Pacific Coast. It outsells every other publication.

Agents report from 60 to 150 subscribers per week. If you wish to know how fortunes are made and lost in a day; how shrewd men are ruined in Wall street; how countrymen are swindled by sharpers; how ministers and merchants are black-mailed; how gambling houses and lotteries are conducted, read SUNSHINE AND SHADOW IN NEW YORK, and learn about New York bankers, merchants, brokers, editors, police, military, detectives, gilt swindlers, pickpockets, etc., with biographical sketches of all the prominent men in the great metropolis.

Agents desiring territory for this rapidly selling book should apply immediately to R. J. TRUMBULL & CO.,
20v1tf1plm 420 Montgomery street, Room No. 5.

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 28, 1868.

VOLUME XVII. Number 22.

Table of Contents.

Our Wooden Pavements and Asphaltum Sidewalks—Illustrated.
The Powell Colorado Exploring Expedition.
Mining in Plumas County.
Earthquake Indicator.
Electric Perpetual Motion.
Eating Clouds.
Ore Deposits and Metallurgy at White Pine.
Chemical and Metallurgical Establishments.

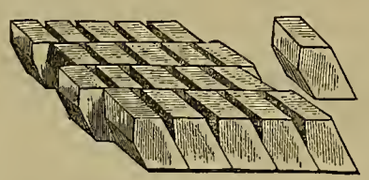
MECHANICAL MISCELLANY.—Puddling Iron; Hardened Iron Mold boards; Black Varnish for Iron Work; The Rubber Tires; Weight of Driving Wheels; Lowe's Marine Propeller.
SCIENTIFIC MISCELLANY.—The Spectroscope and the Motion of the Stars; Remarkable Aerolite; Hydrocarbons from Organic Matters; Vibration of Steel under Different Magnetic Conditions.
ENGINEERING MISCELLANY.—Nobel on Dynamite; Application of Photography to Mapping; A Great Year for Railroad Building.
MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon.
San Francisco Mining Shareholders' Directory.
San Francisco Metal Market.
New Patents and Inventions.
San Francisco Market Rates.
Notices to Correspondents.
Stock Prices—Bid and Asked.
New Incorporations.



Our Wooden Pavements and Asphaltum Sidewalks.

The city of San Francisco in taking her position as permanent mistress of the Pacific Ocean, and as the powerful queen of commerce to whom continental railroads and the radiating steamer lines of a hemisphere shall bear unceasing and willing tribute, will not fail to give to strangers a good impression at first sight. Our streets will be found better paved, and our sidewalks more commodious and agreeable to the eye, as well to the feet of the "citizen of the world," than those of any other metropolis on the face of the globe. In making comparisons with London, Paris, Berlin and New York, the unsightly and torturing cobbles, and the narrow or rudely constructed sidewalks constituting the rule in the older cities, (modern Paris only excepted), will render the verdict in favor of our young city of the golden era, and of modern improvements, easy and unequivocal. The Rue de Rivoli and the Boulevard des Italiens, are not better paved than Montgomery, California and Kearny streets, and all the other leading streets of San Francisco where the wooden pavements and asphaltum sidewalks are either now in use, or are being constructed as fast as possible, even for stretches of miles leading out over the sand-hills towards the ocean.

We enjoy the satisfaction of possessing in our streets a superior cleanliness, a general cheerfulness of aspect and quiet; at the same time that both streets and sidewalks are of the most perfect quality known for use. Immunity from the infernal din and clatter of vehicles, and a variety of attendant demoniac noises which doubtless have their influence upon the people's manner of thinking and acting, renders life in the city more agreeable, and the tone of the inhabitants more civilized and refined.

When the advantages of wooden pavements are so great, it would be indeed a calamity, if, after all, objections of an insurmountable character should be encountered which would deliver us again to the savage state of a cobble paved, or a horse torturing city. The danger lies in the perishable character of the wood. Many years ago wooden pavements became popular in England, and were tried to a considerable extent, as may be read in almost any of the standard works on engineering; but the material was discarded because its perishability as then applied made it too expensive, and because in the wet season the streets became very slippery.

The Nicholson and other wooden pavements obviate those difficulties as far as possible; though time only can demonstrate whether we shall be able to stay forever rid of the noisy stone pavements. By means of a coal tarred board or paper foundation, the Nicholson pavement people claim that moisture is prevented from rising to the wood and thereby causing the blocks to rot; and by means of a bitumen and gravel concrete in crevices left between the blocks, slipperiness is pretty satisfactorily obviated.

THE PERRY PAVEMENT.

The Perry and the Stow pavements are variations of the wooden block pavement, which have been invented and patented by citizens of San Francisco; both presenting meritorious points worthy of consideration by property-holders as well as by the city authorities. Taking the official statistics of the last year's paving done in San Francisco, it appears that the cobble and Nicholson pavements together put down amounted to 483,513.59 feet, at a cost of $172,087.88; besides which planking was done to the extent of 6,384,339 square feet, at a cost of $237,482.30. As the best pavement will in the end occupy the field, and will afterwards have the replacing of worn out pavements likewise to do, it is not surprising that capital should have entered freely into the competition between the companies, and that the lawyers have already made their appearance in full force, in the infringement case of the Nicholson Company *vs.* Stow,—which is reported to be decided in favor of the defendant, and all further prosecution by the Nicholson Company to have been dropped.

The Perry pavement differs from the Nicholson in having the grain of the wood slanting, as represented by the white lines in the accompanying cut; and in having the crevice or cell V-shaped, and broken by alternation of the blocks. The advantages claimed are that each block leans upon the other, giving to the pavement the effect of solid wood; that the edges of the block, by reason of the peculiar angle of the grain to the surface exposed, are not so easily worn off or beaten down; and that the horse's hoof has less chance to enter and to dig out the contents of the V-shaped cell. Another point which will probably prove an advantage, is that in the wet season when the wood swells, the pavement would not necessarily arch or sag from the pressure lengthwise of the street, since each block would merely rise a little towards a vertical position, by sliding on its neighbor so far as to accommodate itself exactly to the pressure. Simple gravel, without any asphaltum, is put into these cells. To prevent the wood from decaying, it is first treated by the wood-preserving process of Mr. Samuels, consisting of the extraction (by exhaustion) of acids from the wood, and injection of solutions of lime and sulphate of iron. The blocks of the Perry Company are sawed at the Stow Company's mill at the foot of Fourth street, where the Wood Preserving Company's works are also located, the latter consisting of a long iron cylinder, and some wooden tanks to contain the solutions. H. E. Perry, of San Francisco, C. G. Spencer, of Placer County, and W. H. Parkinson, of Oakland, are managing the business under the Perry patent, at No. 622 Clay street.

On Wednesday they were laying their pavement at the crossing of Washington and Montgomery streets, and there are two full blocks to be laid on Montgomery street, between Clay and Jackson, and on Kearny street from Pacific to Broadway, besides which, other contracts are being perfected.

Work of this kind is always done for the property-holders, who sign papers to the agent of the Pavement Company, agreeing to pay a fixed amount per square foot as soon as the pavement has been accepted by the city authorities. Any vertical wood pavement is legal, according to an act passed by the Legislature a year ago.

The Stow foundation pavement has an original feature which looks well theoretically, and which is claimed to have proved no less advantageous in practice. The blocks are of the same size as in the Nicholson pavement, 6x3x6 to 18 inches, but in the place of a board foundation there is nothing but a bed of wet sand. This is packed tightly by means of longitudinal wedges, alternating in rows between the rows of blocks. It is claimed that this pavement will not warp as much as the Nicholson; and during the period for which it has been tried, in pieces on Ellis street between Powell and Mason, and on Merchant street along the City Hall, laid six months since, the claim is not denied; but it is four years since the Nicholson pavements were first laid down on Montgomery street, and a test of one rainy season at least would be necessary to afford proper data for comparison. An important advantage is claimed in favor of the Stow, which the Nicholson Company avoid as a disadvantage, viz: the free circulation from below of moisture through the blocks. The Stow Company claim that the board foundation arrests moisture and causes dry rot. Easy taking up and replacement of the Stow blocks for gas and sewerage repairs, is undoubtedly an advantage in favor of the Stow pavement. Wood preservation by the Samuel's process is also made use of. A block of Stow pavement has just been finished on Ellis street. H. T. Williams, of No. 407 California street, is the agent.

The Nicholson pavement is so familiar to everybody that it will only be necessary to mention that the greater part of the city has been paved with it. In the winter it swells, and in summer it shrinks, letting the sand into the interstices; notwithstanding which it has given satisfaction, and property-holders will prefer it wherever they can afford it. All wooden pavements are, counting in the repairs, more costly than stone. The President of the Nicholson Company is Charles McLane, and the office is at No. 619 Montgomery street.

Asphaltum sidewalks are becoming universal. They are made with Santa Barbara asphaltum and fine gravel, on a foundation of brick laid on boards, underneath which there is sand. Many companies and individuals are doing a thriving business,—amongst whom, Messrs. Bonnet, Duncan, Easton, Menant, Neuval, and Larkin, etc., may be mentioned,—the starting condition being generally the ownership of some favorable locality for the production of asphaltum. Asphaltum pavements are the best for sidewalks ever invented, and are only objectionable on account of the inconvenience of making subterranean repairs. On the Boulevard des Italiens, and other streets in Paris, asphaltum pavement has been well tested, and found very superior for vehicles, but for that purpose it requires nightly repairs, and is unnecessarily costly.

THE RECENT METEORIC DISPLAY came without anybody's having predicted it, a circumstance more extraordinary than the display itself. Prophets of the least degree of sharpness should have two or three predictions constantly in hand, so arranged as to catch certainly either a meteor or an earthquake. Meteoric displays are, however, really foretold on a basis of scientific data; it having been ascertained by astronomers that certain parts of the great ocean of space, in which the planets and stars are floating like little atoms in a lens of water, are more thickly studded with these floating particles than others, and that we may calculate with some show of probability at what times the earth will come into the vicinity of such as it might have the power to attract.

The display on the night of the 11th inst., commenced at about half-past ten o'clock, and from that time until two o'clock it was almost continuous. Many peculiar appearances in the heavens were noted. About one o'clock, a meteor, bursting apparently near the constellation of Orion, left behind it a cloud which assumed a rose-colored appearance, then changed to white, grew thinner, and finally disappeared. Another meteor, at a later hour, left behind it a similar cloud. In the course of the shower several of the meteors left trails of light which were distinguishable for many seconds. The general direction seemed to be from the east towards the west, although a few took a northeasterly and southwesterly direction.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Mining in Plumas County.

THE KITTLE MINE AND MILL,

Fudkins & Kellogg, owners, is situated in Cherokee District, Indian Valley, Plumas County. I have been compelled to talk somewhat unfavorable about the mines in Plumas County; but I am pleased to be able to point out to the mining community at least one mine in that county which deserves credit for good management and the regularity of its returns. This mine was opened in the fall of 1861, by Kellogg & Bolinger, by running a tunnel 250 feet on the vein, raising four wings up to the surface, and by building a mill of sixteen stamps, with steam-power. This company could not make the quartz pay expenses, and quit work in March, 1862. Mr. Bolinger being the owner of the mill, moved the same to the Crescent mine, and in that way the Kittle mine was abandoned. It laid idle until March, 1866, at which time Fudkins went into partnership with Kellogg, and commenced work at the mine just where the former company had stopped. Fudkins & Kellogg run a drift on the vein from the old tunnel towards the east, and had some small samples of ore in parcels of ten to twenty tons crushed at the old mill at Dixie Cañon, about one mile below the mine. This quartz, worked in a careful manner, paid from $8 to $15 per ton. Fudkins & Kellogg concluded then to rent the Round Valley quartz mill, having a capacity of sixteen stamps, which is situated near the Ellis ledge, at Round Valley, about one mile above the Kittle ledge, and is worked by steam-power. After repairing the mill they commenced crushing quartz, and cleaned up after the first week's run $3,082. This mill was kept running steadily for six months, and the company had weekly clean ups of about $2,000. After such a test, Fudkins & Kellogg concluded to have their own mill, and to have regular work started at their mine. They bought a lake, which is formed near Round Valley, and all the water privileges connected therewith, built on the outlet of this lake towards the ravine a large and very well constructed dam, in order to have the water-power so increased as to derive sufficient power for their own mill, and surplus water for surrounding quartz mills and for surface and hydraulic diggings, expending for this very valuable property about $15,000. The land covered by this lake is about 400 acres, and the average depth from seventeen to eighteen feet. The New York Quartz Company bought water-power for their mill, at $150 per month for forty inches, the water being taken to the New York mill after it leaves the mill of Fudkins & Kellogg. The latter is built a little below the dam, and is worked by a turbine. The mill has sixteen stamps. The castings were made at the Marysville Foundry, the stamps being 750 pounds in weight. The erection of this work was commenced in the fall of 1866, and was finished the end of June, 1867. Since that time the mill has been kept running regularly, and has given weekly returns of at least $1,500, as the books of the company will prove. These returns were only the results in free gold; the blanket washings are saved, but are not worked. On the mine the company is now erecting new hoisting works,—a 30-horse-power engine,—which will be completed before winter sets in. The company sunk a shaft of seventy feet, and drifted on the vein for 300 feet, on which there is a drift towards the west eighty feet long, and one towards the east 120 feet long. The ground is ready for stoping, and the shaft will be sunk seventy to eighty feet deeper. The ore is now taken from the seventy-foot level, and from the top of the hill where the former company abandoned work; and the quartz is hauled to the mill on a very excellent wagon road. There is very little water in the mine. The company calculate their expenses for mining and milling at $2.50 per ton. Fudkins & Kellogg have proved that low grade ore can be made to pay expenses, and to leave a good surplus, if carefully and economically worked.

Never was it more plainly illustrated what mismanagement can do, than at the once celebrated "Crescent" mine, in Indian Valley. The first discoverers of the ledge, Mr. Pulsifer and James Blood, made some money by working, and afterwards by selling the property, each of them withdrawing with about $75,000. The parties that became owners of this property, Glazier Brothers and W. A. Bolinger, formerly tobacco merchants of Marysville, succeeded finally in working out the property to the present level, not sinking any deeper, and they had to quit last fall, paying twenty-five cents on the dollar, and having their property sold by Sheriff's sale. It was bought by M. Marcuse & Co., Marysville, who is everywhere considered as but the agent of the former owners. The property has very fine hoisting works, and a splendid mill of thirty-two stamps, steam-power. The old mill of twenty stamps, which would have been sufficient for milling purposes, was sold to the Whitney Company (Bolinger and partners). The original owners, Pulsifer & Blood, believed that the new mill of thirty-two stamps was only built in order to succeed in freezing them out. The new mill cost over $100,000, the fine engine and other castings having been made at the Marysville Foundry. An English company was a few years ago on the point of buying this property for $260,000, but the sale could not be brought to a close, as their agent did not believe in the returns of the mine. Fame says, that besides the bullion from the mine, $20 pieces were emelted, and the English agent was by this rumor so much confused that he thought it safer to withdraw. Since then, the mine went down, as I have remarked, in consequence of poor management. The quartz is undoubtedly rich enough to pay largely over expenses, if properly worked. The mill, although in appearance very fine looking property, could be much improved and be arranged to save enough of the free gold and sulphurets to pay a dividend to the company. To enter into more particulars would only lead to laying open the mistakes made in the managements, and such is not the object of this report. But I am confident that a competent party could work this property to great advantage, though not without having to spend a large amount of money,—say about $40,000,—in reopening the mine by sinking and establishing new stopes. The present company I believe would sell the property for about $100,000, which would bring the property to a cost of about $140,000, the improvements being unavoidable.

FUTURE OF AMERICAN SHIP-BUILDING AND SHIPPING ON THE PACIFIC.—Replying to a writer in the Boston *Commercial Bulletin* maintaining that English, French, German, and Danish shipping would get the advantage of American shipping on the Pacific, as they have done in the Atlantic since the rebellion, the *Commercial Herald* of this city says:

He does not comprehend the fact that we can build vessels much cheaper on the Pacific Coast than even in the State of Maine. Our forests supply a better class of timber; we manufacture our own pitch, tar, turpentine and rosin on the spot; the same regions produce the finest of iron and copper; hemp is grown in abundance, almost in the same localities; we manufacture running and standing rigging of as good qualities as the imported, and for lower prices; and when the demand comes we can make as good sail cloth. Scarcely anything will have to be imported, while Maine is compelled to go abroad for all she requires except timber. The labor of skilled artisans commands a higher price in California; but not enough to counterbalance the difference of expenditures in many other respects. Another great element in this connection is the fact that we have, and can obtain to any required extent, cheaper labor than our Eastern or European competitors. The Chinese and Japanese can eliminate the products of our forests, soil and mines, at less expense than the same labor can be performed for in either the Atlantic States or Europe.

THE Central Pacific Railroad Company are building a car of California laurel for the first through trip to New York.

Engineering.

NOBEL ON DYNAMITE.—M. Nobel, the inventor of this blasting agent and of nitroglycerine, read a paper in reference to them at the recent meeting of the British Association at Norwich. We give a small portion of it: "Dynamite consists of 75 per cent. of nitro-glycerine and 25 per cent. of porous silica. Hence it appears to possess only three-fourths of the power of nitroglycerine, the specific gravity of both substances being very nearly the same. But, practically, there is no advantage in the greater concentration of power of nitroglycerine. It cannot, or at least ought not, to be poured direct into the borehole, since it easily causes accidents by leaking into crevices, where it explodes under the miners' tools. It must, therefore, be used in cartridges, which leave considerable windage; whereas dynamite, being somewhat pasty, easily yields to the slightest pressure, so as completely to fill up the sides of the borehole, and leave no windage whatever. The greatest drawback on nitro-glycerine is *its liquid form.* Nearly all the accidents from its use have been owing to leakage, which is very difficult to prevent. Casks are not tight enough; and owing to its expansion on freezing, I have been obliged to resort to square tins. Yet these leak more or less."

REMOVING THE SAND HILLS BY STEAM. Invention has gone to the aid of real estate owners, to assist in the extension of civilization over the sand-hills. At the corner of Market and Seventh streets there is now at work, on the end of a piece of railroad track, a machine on wheels resembling a harbor dredge, but the scoop, a large iron scuttle capable of carrying away a ton of earth, goes into the sand hills instead, and dips them up piecemeal on board of a train of cars, which travel to Mission Bay, where a tract of marsh is being transformed into good dry land, and where the water is being faced all around by a respectable looking solid embankment of about four feet in hight above high tide. Where the sand-hills and tide marshes *used to be*, is already a question partly of history; and we shall soon see retrospective philosophers and the literary newspapers talking about them as they have long been doing concerning the swamps of Canal street, New York.

APPLICATION OF PHOTOGRAPHY TO MAPPING.—Col. Avet, of the Italian Staff Corps, has for years busied himself in seeking means of transforming a photographic impression into an engraving otherwise than by the ordinary tedious manual labor. He has at last perfectly succeeded, and military maps are produced by his process. In twenty-four hours he can copy a large topographic drawing, reproducing it, beautifully printed, on either a reduced or enlarged scale. Some of his reproductions are so small that they can be made out only by the help of a strong magnifying glass. The result of his most valuable invention will be to save the immense amount of labor and loss of time hitherto indispensable to the multiplication of topographic drawings. The invention may be applied to all kinds of drawings.

HYDRAULIC LIFTING AND MOVING OF BUILDINGS.—The large building at the southwest corner of California and Battery streets, estimated at a weight of about 3,000 tons, is to be raised by 55 hydraulic presses; the contract for raising it a few feet and moving it 30 feet back, having been let to Stratton Brothers at $14,000. Serious damage had been experienced from the earthquake, and the building is now to be placed on the new street line.

SURVEY OF THE NORTHERN BOUNDARY OF NEW MEXICO.—Astronomer Darling, and that party sent to determine survey and mark the northern boundary of New Mexico, reached the Rio Grande, 148 miles west of the initial point, on the 6th of September. They expected to complete the work by the middle of November. The whole length is 3.0 miles.

A GREAT YEAR FOR RAILROAD BUILDING. There has been great activity in railroad building during the present year. Aside from the extension of the Pacific Railroad, we do not recall the formal opening of any long routes, but a vast number of "connections" and short routes have been completed. We read of them over all the States. In Maine they are building short lines everywhere, to work out the problem of their great through line from the Atlantic to the Pacific. In the rest of New England similar activity is witnessed, and the iron road is stretched from town to town. Wherever there is population or a mill, there a feeder is constructed to join some through line, and so bring the remotest parts of the six States into quick communication with the great centers of trade. In this State, four or five long lines are under way, crossing the State at favorable points, and uniting remote towns of importance with this city. At the West and South, long lines are projected, and work has been begun which will soon connect the Lower Mississippi and the Gulf with the great trunk lines that already cross from the Upper Mississippi to the Atlantic. Great as has been the extension of railroads in this country, the present ten years, counting from the close of the late war, will witness a more marvelous increase. It is seen that if the stock of new roads does not pay a dividend, that the country is benefited by the cheapening of transportation, the new facilities of intercourse, and the increase in value of taxable property. This circumstance has led to the adoption of the plan of local and municipal subscriptions, and the taxpayers of hundreds of localities readily vote a town subscription.—*N. Y. Commercial Advertiser.*

THE INDIANS AND THE "SMOKE WAGONS." Those engaged in the construction of the Central Pacific Railroad have a good deal of fun with the Indian tribes they encounter. Never having seen or dreamed of such a thing as a locomotive or a train of cars, they are greatly astonished at seeing the trains running to and fro, and backing and prancing about with no visible motive power. When the cars came among the Piutes they named them "smoke wagons."

LAKE NAVIGATION CANAL.—The St. Clair Flats are being canalled by the enterprise of Western merchants, a distance of 1¼ mile, and to a width of 300 feet, so as to admit vessels drawing 13 feet of water. The canal is furnished with timber dikes, one on each side, running the entire length, which will be filled from the excavation from the channel. The banks, besides, are being made fifty-eight feet wide, and five feet above water.

STOCKTON AND TULARE RAILROAD.—There is every reason for believing that the work of constructing the Stockton and Tulare Railroad will be commenced at an early day, and that the northern terminus will be established in this city. Kidder, the engineer of the company, arrived two days ago from San Francisco with a corps of men, tents, and the necessary camp equipments for the field work, and will commence a preliminary survey of the route immediately.—*Stockton Gazette.*

NEW RAILROADS BUILDING IN PERU.—Henry Meiggs has been authorized to make a survey of the proposed line to Janja, crossing the Andes.

The Cerro de Pasco Railway Company has been formed in Lima. This will be the first railway in the interior of Peru.

RAILROAD CONDUCTORS.—Gov. English, of Connecticut, has given all railroad conductors commissions as special policemen, thus enabling them to more completely govern the conduct of passengers.

ELEVATED RAILWAY.—Legal obstructions to the building of the New York elevated railway have been set aside, and the construction is going on.

MISSISSIPPI BRIDGE.—The business men of St. Paul are negotiating the question of building a bridge across the Mississippi at or near Denoyer's place. They estimate that the structure will cost ninety thousand dollars.

THE NEW RAILROAD BRIDGE crossing the American River will be completed in about three weeks.

ON the Petaluma and Healdsburg Railroad the graders have now reached a point near the Halfway House in Santa Rosa valley.

Mechanical.

Puddling Iron.

Mr. Siemens read an elaborate paper at the Norwich meeting of the British Association, which is spoken of by the *Colliery Guardian* as the most important of those presented. That journal says: "The paper was of a very scientific and technical character, and proved that the present process of puddling was very defective, involving great loss of metal, waste of fuel and of labor, and an imperfect separation of the sulphur and phosphorus. After referring to the chemical constituents of iron, and explaining the manner in which these were affected by various puddling processes, he went on to observe that he was unable to say how nearly they would be able to approach the results indicated by the chemical reasoning he had adopted; but that much could be accomplished by the means within reach was proved by the result of eighteen months' working of a puddling furnace erected to his designs at the Bolton Steel and Iron Works, in Lancashire. This furnace consisted of a puddling chamber of ordinary form, heated by means of a regenerative gas furnace. The advantages of this furnace were that the heat could be raised to an almost unlimited degree; that the flame could be made at will oxidizing, ucntral, or reducing, without interfering with the temperature; that in-draughts of air and cutting flames were avoided, and that the gas fuel was free from pyrites and other impurities, which were carried into the puddling chamber from an ordinary grate. In this respect the new furnace presented the same advantages as puddling with charcoal. With regard to the economy of material, experience had proved that an ordinary furnace receiving charges of 484 lbs., yielded an average of 426 lbs., representing a loss of twelve per cent., whereas the gas furnace received charges averaging 428 lbs., and yielded 413 lbs., representing a loss of 3.5 per cent. Moreover, the gas furnace turned out eighteen heats in twenty-four hours, instead of only twelve heats, the limit of production in the ordinary furnace. The quality of the iron produced was also decidedly superior. The consumption of fuel was also greatly in favor of the gas furnace.

How to Oil Belting.—The following is from an article on "the preservation of leather," in the *Shoe and Leather Reporter:* When oil is applied to belting dry, it does not spread uniformly, and does not incorporate itself with the fiber as when partly damped with water. The best way to oil a belt is to take it from the pulleys and immerse it in a warm solution of tallow and oil. After allowing it to remain a few moments the belt should be immersed in water heated to one hundred degrees, and instantly removed. This will drive the oil and tallow all in, and at the same time properly temper the leather.

Hardened Iron Mold-boards.—It is said that the following method of treatment gives to plow mold-boards all the hardness and temper of steel, in combination with the toughness of iron. The mold-board (good iron) is heated and dipped into molten iron. It remains there ten seconds, when the two surfaces become heated to a white heat, while the center is not heated through. It is then immediately dipped into water; the surfaces come out harder than the highest tempered steel, while the interior is still iron and retains all the toughness and strength of the iron. The advantage claimed for this invention is that the plows made by this process will take the finest and hardest polish, while they will be tough enough to endure any reasonable knocking about in stony soils.

Black Varnish for Iron Work.—Dr. Lunge distills gas-tar until nearly all the volatile products are got rid of. He then stops the distillation and dissolves the residual pitch either in the heavier oils, or, if a very quickly drying varnish is required, in the light oils or naphtha. This varnish is, of course, the original tar, minus the ammonia, water, carbonic acid, and other things which give it its disagreeable odor, and make it so long in drying.

The Rubber Tires.—In reference to Thomson's road steamer,—which we have already spoken of as having attracted much attention, and the performance of which was so far beyond what had been expected of it,—the London *Engineer* says:

"This road steamer has wheels of a material which at first sight does not look a very likely substance to stand the heavy work they are subjected to. The tires are made of bands of vulcanized india-rubber about twelve inches wide and five inches thick. Incredible as it may appear, this soft and elastic substance not only carries the great weight of the road steamer without injury, but they pass over newly-broken road metal, broken flints, and all kinds of sharp things, without even leaving a mark on the india-rubber. They do not sink into the road in the least degree. They pass over the stones lying on the surface without crushing them.

The power required to propel the steamer is much less than what would be required if the tires were hard and rigid. It might at first sight be supposed that it would take a great deal of power to propel a heavy carriage on soft tires; but if the tires are elastic as well as soft, the power used in compressing the tire in front of the wheel is nearly all given back as the elastic tire expands behind the wheel.

Trials have been made at Leith by running the steamer across a soft grass field, in which an ordinary steam carriage would certainly have sunk. The way it ran through the grass, without even leaving a track, was very remarkable; but when it made for a part of the field which had just been covered with loose earth to the depth of one or two feet, and ran straight across, and then back through the deep soft soil, the surprise of those present was great indeed. The weight of the steamer is between four and five tons; and yet the wheels in passing over the loose earth compressed it so little that a walking stick could easily be pushed down in the track of the wheels without any exertion. It is quite clear that one of the great difficulties farmers have had to contend with in using steam engines for plowing is now removed, for the road steamer will run through any field, even when newly plowed, without any difficulty."

Weight on Driving Wheels.—Mr. Fairlie, an English engineer, who has paid much attention to the subject, asserts that the cost of maintaining a line of railway is *in exact ratio with the weight on the driving wheels of the locomotive engines* which work it. It is not at all a question of train tonnage, but of the sledge hammer locomotives. He says: The Cornwall line is worked by a 40-ton tank locomotive on six wheels, which when at work represents a rolling mass whose effect through constant jerking and oscillating is nearer 60 tons on the rails. It is useless attempting to work with any hope of economy a line on which such engines are used. The Metropolitan Railway is worked by locomotives almost as destructive as the Cornwall engines, consequently that line has been relaid with steel rails three times in less than six years.

Suspension Bridge Across the Hudson River.—The new bridge will have a clear span of 1,600 feet; the longest yet built upon the continent. The twenty cables will contain seventy thousand miles of steel wire. The bridge will be capable of carrying at one time 32 passenger cars.

Lowe's Marine Propeller.—The last improvement made by this inventor is the adoption of "radial blades so shaped that when viewed edgewise or endwise, instead of forming portions of the thread of a screw, they present a curved line curling in opposite directions from the center to the edges of the blade."

To Keep Iron Implements from Rusting.—Wash and rub over them a mixture of lard and turpentine. The paint-pot and brush should be kept and used by every farmer and mechanic. All wood work ought to be kept constantly well painted, especially the wood work of wagons, plows, etc.

Sargent's Brick Machine, with about five or six horse power, turns out 20,000 bricks daily, which are superior to any made by hand. The cost of the machine is $1,000.

Scientific Miscellany.

The Spectroscope and the Motion of the Stars.

Fraser, for October, has an interesting article from the pen of R. A. Proctor, B. A. F. R. A. S., entitled "News from Sirius." The writer refers to the recent experiments and conclusions of "the eminent physicist." Mr. Huggins, of the Royal Society of London, who has made some observations upon the spectroscope as a means of measuring the distances and the motions of the stars.

We can form an estimate of the *transverse* motion of stars, by their apparent change in place as referred to other stars. But the motion directly towards or from us, is not attended with any such change of place. The star 61 Cygni, one of the few fixed stars, the distance of which has been measured, travels 1,450 millions of miles a year, in a direction transverse to our line of sight. But suppose it to be also *approaching* us. Its rate of motion towards us must be determined in some other way. No change is perceptible in its appearance. Even if it approached at the tremendous rate named above, its *brightness* would not appear to be increased; for, as the distance of the star from us is fifty thousand times the aforesaid 1,450 millions of miles, it would take a thousand years for it to get a fiftieth part nearer to us than at present.

It has been suggested that the *color* of stars might be an aid in the estimation of their motions. Light is propagated, like sound, by the vibrations of a transmitting medium. When these vibrations are less in number than 450 billions per second, they manifest themselves merely as heat,—not light. Increased in rapidity to 500 billions per second, they produce upon the eye the impression of *red;* 50 billions more, of *orange;* 50 more, *yellow;* 50 more, *green;* 50 more, *blue;* 50 more, *indigo;* and 50 more,—that is, when they amount to 800 or 850 billions in a second,—*violet.* Now we know that the whistle of an approaching locomotive is apparently sharper, and that of a receding one flatter,—than its real pitch;—that is, the vibration of the sound-conducting medium are in the first instance apparently more and more rapid, and in the second less and less so; although we know that they really remain the same. In like manner it has been proposed to judge of the motion of an approaching or receding star by its changing color. But this may be so modified by circumstances as to lead to error.

The parallel dark lines which cross the solar spectrum are so arranged as to be each easily recognizable by those who have once become acquainted with their relative position. As the spectra of the stars, also, have lines corresponding to these, we have only to compare the position of one of these lines, after it is once recognized, with the position of the corresponding line in the solar spectrum. If these two positions are not the same, the star is either receding or approaching; the first, if the shifting is towards the *red* end, and the last, if it is towards the *violet* end, of the spectrum. Upon this were based the observations of Mr. Huggins. The conclusion derived from these observations was, that Sirius is receding from the earth at the rate of 930 millions of miles per year. As, however, our sun, with its system of attendants, is traveling at the rate of 150 millions of miles per year towards a point in the constellation Hercules, directly opposite to Sirius, we must deduct that,—leaving only 780 millions of miles as the usual rate of recession of Sirius from the earth. If, again, we take into account its transverse motion, it fixes the movement of Sirius in space at upwards of 1,000 millions of miles per year.

In the course of his concluding remarks, Mr. Proctor says: "There now really seems a promise that one day something may come to be learned respecting the movements of the sidereal mechanism. The constellations which now seem to be scattered without discernible law over the vault of heaven, may be forced perhaps to reveal to us their secrets, the law of organization which binds them into a system, the paths along which their component stars have been traveling before they reached their present position, and those along which they are to travel for many future ages."

A Remarkable Aerolite.—Dr. Franklin Massena sends a communication to the Anglo-Brazilian *Times* of Aug. 7th, in reference to an aërolite which he and his scientific associates saw while at the Observatory of Italaya on July 30th. After describing its immense size, its direction and its brilliant scintillations, he goes on to say: "This aërolite so disturbed the magnetic instruments that the declinometer turned its pole from the north toward the west and stuck itself in the box where it found resistance; the horizontal magnometer turned toward the west eight divisions of the scale; the vertical magnometer fell in its center of gravity, and finally, the compass oscillated 15° from north to west. I showed Sr. Arsenio the disturbed state of the declinometer. It is therefore, demonstrated for physics that an aërolite has an intense action upon the north pole of magnets, powerfully attracting them.

"The following are some mathematical elements of the orbit of this body: Meridien passage, 5h. 55′ 33″, on July 30, 1868; declination, 65° south; vertical distance, 42° 32′; setting, 50° 15′ W. by S.

"With these data the orbit of the aërolite is found to have 17° 40′ of inclination upon the line of the earth's rotation, with its movement contrary to that of the earth.

Hydro-carbons from Organic Matters. Berthelot uses as a re-agent for the transformation of organic bodies into hydro-carbons, an aqueous solution of hydriodic acid of density 2. The less the amount of hydrogen contained in the organic substance to be decomposed, the greater the quantity of acid employed. The two are heated in a sealed tube to 527° Fah. for ten hours. A series of changes take place which result in transferring the hydrogen in the acid to the carbon, and forming compounds generally homologous with marsh gas, or hydride of ethyl. Alcohols, ethers, aldehydes, acids, aromatic carburets, alkaloids, complex nitrogenized bodies, when heated, are broken up by the superior saturating power of hydrogen, which under these conditions, displaces the strongest electro-negative elements.

Vibration of Steel under Different Magnetic Conditions.—The following interesting experiment, made by M. Treves, is given in Galignani: "Two steel tuning forks brought to the same pitch were topped with small mirrors, and placed opposite to each other in two vertical planes at right angles. One of them, No. 1, was, moreover, surrounded with a strong coil of wire receiving an electric current from a nitric acid pile composed of four elements. A fiddlestick being now drawn across each of the tuning forks, the vibrations commenced, and immediately a perfectly motionless luminous circle was produced in the mirror of No. 2. But no sooner was No. 1 magnetized by the admission of the current, than the circle became an ellipse, and swayed to and fro, denoting the action of a new vibratory motion. As soon as the current ceased the figure became a fixed circle again. This experiment may serve to investigate the vibratory powers of iron and steel according to their composition and physical state."

More Relics.—The bones of a gigantic race of Indians have been discovered near Marlboro Point, on the Potomac river. The discovery of a large number of beads, moccasins, etc., leaves no doubt of the character of the remains. Further investigations are to be made. The condition of the remains indicate that they must be centuries old.—*Scientific American.*

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING NOVEMBER 30.

No. 83,820.—IMPROVED HAIR RESTORATIVE. E. J. Balcear, of Martinez, Cal.:

I claim the within-described ingredient or root, treated and prepared in about the manner herein specified, for the purposes set forth.

The above is a very ingenious application of the common soap root so abundant on the Pacific Coast. The inventor, a lady, has evidently secured a valuable patent.

No. 83,839.—IMPROVEMENT IN HARVESTERS. Jas. F. Earl, of San Francisco, Cal.:

1. I claim the vertical adjustment of the cutter-frame relative to the main frame, upon a pivot or shaft, in advance of the main axle, by means and substantially in the manner described.

2. The arrangement of the driving-gear, in combination with the vertically-adjustable cutter-frame, substantially as described, whereby the hight of said frame may be adjusted without disturbing the working relation of the gear-shafts.

3. The rake-head, constructed as described, in combination with teeth applied thereto, and operating substantially as described.

4. The manner of actuating the rakes by means of the straps or belts, and drums or rollers, and shifting clutches, operating as described.

5. Operating the shifting-clutches, by means of the rake head acting alternately thereon through the clutch-levers, as described.

6. The slotted plate, to which the middle fingers are attached, forming the box inclosing the springs, and permitting the withdrawal of the lever-staple and the removal of the sickle, as described.

7. The arrangement of the fulcrum of the reel-frame, in rear of and above the pivot or axis around which the sickle-frame is adjusted, in combination with means for simultaneously adjusting said frames, whereby the relation of reel and sickle is varied when the hight of cut is varied, as described.

8. The hollow reel-shaft, provided with the end-hubs and with the central stiffening-sleeve and central bub, as described.

9. The adjustment of the steering-wheel upon a horizontal axis or pivot, for the purpose of maintaining the same in a vertical position, irrespective of the position of the main frame and cutters.

10. The attachment of the driver's stand or seat and the sickle-adjusting mechanism to the horizontal axis upon which the steering-wheel is adjusted, substantially as and for the purpose set forth.

11. The combination, with the grain-platform, of a reciprocating rake, adapted to deliver the grain at either end of the platform, as set forth.

83,842.—IMPROVED QUARTZ CRUSHER.—Edward Ford, San Francisco, Cal.:

I claim the horizontally-acting batteries A and B, when placed one above the other, and acting against the vertical dies E E, with the screen M, and feeding the ore from one to the other, the whole constructed and operating substantially as and for the purpose herein described.

This invention consists in placing a series of vertical dies one above another, also a series of stamps which act horizontally against these dies by means of springs behind them, and which are operated by cams and tappets, so that as the ore is fed to the upper stamp it is reduced to a certain degree of fineness, and then passes through a screen to the second, where it is still farther reduced. The stamps have a certain length of face, and are run at such a speed as to catch the falling ore as it passes between them, and the dies thus effectually crushing it.

83,845.—IMPROVED DREDGING MACHINE.—Andrew J. Gove, San Francisco, Cal.:

1. I claim the beam E, turning about the axle c, and the governing-chain G, G', moving about the drum H, together with the excavator B, and its lever D, pivoted to the beam E, at the point F, also the regulating chain I, the whole constructed and arranged substantially as and for the purpose described.

2. The beam E, and the lever D, with its excavator B, working in the well or opening a, substantially as and for the purpose herein described.

The object of this invention is to provide an improved machine for dredging out the beds of rivers, or other places where the mud or sand to be removed is under water, and it consists of strong horizontal wooden framing or staging, mounted upon the requisite hoying apparatus, which is made in two sections, at one end leaving space sufficient for the spade or excavator to pass up and down through it. The spade or excavator is attached to the end of a lever of sufficient length, which is connected at its fulcrum to the end of a small beam. The center of this beam is secured to the framework on each side of the division in the float, by a bolt passing through it, upon which it turns. A chain is attached to the lower side of the beam near its upper end and passes through the lower end over a sheave, and is attached to the lever midway between the fulcrum and weight. A similar chain is secured to the upper end of the beam, and passes back over a sheave and to the opposite end of the beam, and a third chain is attached to the excavator, and passes up and through a sheave in the framework, directly over it, and serves to raise and lower it.

83,862.—IMPROVEMENT IN HORSE-POWER FASTENER.—Richard Knott, Suisun Cal.:

I claim the arrangement of the frame A, with arms E, E, attached to the timbers C, C, the hooks G, G, and adjusting-screw I, I, for fastening the horse-power to the ground, retaining it in position, and leveling it, substantially as herein described.

The inventor claims that by this device the horse-power is confined more securely to the ground, and can be taken up and replanted by one man in less time than it takes two men to accomplish the same object by the ordinary method. But two adjustable pieces of timber are employed.

83,868.—IMPROVEMENT IN APPARATUS FOR COLLECTING PRECIOUS METALS.—James T. McDougall, San Francisco, Cal.:

1. I claim vertical or inclining iron standards C, C, with stems or bars D, D, resting on a plate or plates of copper B, or plates of some other metal having affinity for mercury, when used for collecting the precious metals, substantially as described.

2. Iron standards, with a supporting horizontal base on the edge of which there are projections, E, E, so that when placed side by side, open spaces, F, F, will be formed between the said staudards, having one or more stem or bars projecting upward, all of which serve as riffles when placed in running water, substantially as and for the purpose specified.

3. Iron stands, with hollow projecting stems H, containing bars, slips, or tubes of copper, H', or other metal having affinity for mercury, communicating with the water outside through slits or openings, I, I, substantially as described.

4. Copper resting on iron, the iron resting on copper, the copper having amalgamated, silvered, or mercurialized surfaces, when placed in sluice-boxes, or other apparatus, or equivalent device, designed to intercept and collect the precious metals moving with the water in the manner and for the purposes herein specified.

5. The metallic obstructing and collecting surfaces or equivalent device, separately or in combination, whether placed in sluice-boxes, concentrators, or other apparatus for collecting the precious metals moving in running water, substantially as described.

This invention is intended for quartz mills, placer mining, and other places where water is used for washing the precious metals, and is varied in its construction for different purposes. The inventor says: I place in my sluice-box a plate of copper or other metal, the upper surface of which is either amalgamated, silvered, mercurialized, or in its natural condition; this plate is bent at right angles to form the side plates. Upon the bottom of this plate I place iron standards having a square or oblong base, single or in sections, from which one or more stems or bars project upward. On the sides and corners of the bases there are projections, so that when the standards are placed side by side there are spaces between them. Loosely fitting copper tubes having amalgamated, silvered, or mercuriallized surfaces are placed over the projecting stems, of sufficient length to reach the surface of the stream. These stems and tubes serve as vertical riffles, and when placed in rows across the running stream, convert it into eddies, between each series of standards. The particles of metal floating in the water, however buoyant they may be, are drawn into the eddies, and by the well-known whirlpool movement, are subject to a double impulse; a downward and outward movement from the vortex of the eddy, and the metal is brought into contact with the amalgamated surfaces where it is retained. An engraving with a full description is necessary to exhibit the advantages and entire principles of this invention.

83,906.—IMPROVEMENT IN SELF-ADJUSTING HOOKS.—William Bisbee, and Fleming G. Kearn, Yreka, Cal.:

We claim forming a notch b', upon the inner side of the head or heads of the hook B, substantially as herein shown and described, and for the purpose set forth.

83,919. — IMPROVEMENT IN FASTENING HORSE-POWERS TO THE GROUND.—Walter Buchanau, Jr., Main Prairie, Cal.:

I claim the straps C, and h, b, and the beams D, D, and G, together with the links g, g, and m, with their keys, the whole constructed and operating substantially as and for the purpose herein described.

This device was illustrated and described in the PRESS, August 22d, 1868.

83,961.—IMPROVED JOURNAL-BOX.—George H. Henfield, San Francisco, Cal.:

1. I claim the frame C, having a center-bar, b, secured to the shell A, by pins d, d, and dove-tailed ends in the recesses h, h, in combination with the soft-metal bearings B, B, separated by the single longitudinal bar b, substantially as described.

2. The frame C, surrounding and separating longitudinally the soft-metal bearings B, B, the latter secured to the shell A, by pins e, and the former by pins d, and dove-tail recesses h, h, protected and strengthened by the corner-pieces k, k, cast upon the shell, as herein shown and described.

84,001.—IMPROVED MACHINE FOR SCOURING, BLACKING, AND FINISHING LEATHER. F. W. Rust, Umatilla, Oregon, Assignor to Self, A. E. Rogers, and A. C. Gibbs.

1. I claim the scouring blocks H, hinged to the pendulum rod, and held in place by rods G, working through the cross-heads F, and provided with springs substantially as described.

2. The hinged levers I, attached to the swinging frame, and arranged to operate or adjust the scouring block H, substantially as set forth.

3. Suspending the scouring apparatus, upon a yielding support, and providing it with a lever and weight, arranged substantially as described, for the purpose of adjusting the scourers to the thickness of the leather operated upon and also to regulate the pressure of the scouring devices, as described.

4. The hollow pendulum or its equivalent for holding the blacking, and feeding it upon the leather while in operation, substantially as set forth.

5. The perforated cross-pipe T, or its equivalent, when arranged to move with the scouring or smoothing devices, for distributing the blacking evenly over the surface of the leather, as described.

6. I claim the platform B, provided with a series of balls C, secured loosely in its under side, substantially as set forth, for the purpose of enabling it to be moved in any desired direction, while the machine is in operation.

HUMAN SACRIFICES TO NECESSITY.—Coal is needed to make power, to drive machines, and to warm millions of people's homes in winter; therefore coal we must have. Poor people in a thickly inhabited country, as elsewhere, must live by labor, and labor must be done to meet necessities, in order to obtain their price; therefore helpless people, under such circumstances, must go into the coal mines, and there become sacrifices to the world's cruel, inexorable demand. It is an old, old story: the people *will* permit themselves to be sacrificed in New Caledonia as stolidly and stupidly they used to bear it on the Hawaiian *heiaus;* on the American railroads and in the English coal mines precisely as they formerly submitted to it in the religious prison yards, and in castle courts. The following is the latest:

WIGAN, (England), Nov. 26.—A terrible explosion occurred in Arley Mine Colliery. Three hundred men were at work in the pit at the time, most if not all of whom perished; thirty-two bodies have thus far been recovered. Hundreds of the relatives and friends of the unfortunate miners are gathered at the mouth of the pit, and the scene is heart-rending.

MONTEZUMA SMELTING WORKS.—We learn that in consequence of attachments served by Messrs. Spence, Rollins, Brown, Nason and others, these works will unfortunately rest for a while under a disability.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

Nos. 289 to 293 inclusive were presented by Mr. J. H. C. Bennett, of Santa Clara, proprietor of a manganese vein at Penitencia Creek, ten miles from Santa Clara, where about eighty tons of ore—psilomelan and pyrolusite—have been taken out.

No. 289.—Wad, with pyrolusite, or brown and black oxides of manganese. Used for chlorination, bleaching and making oxygen.

290.—Psilomelan, or black silicate of manganese.

291.—Rhodonite, or manganese spar, being the red silicate of manganese. It changes on exposure to the air into psilomelan. Calcspar is intermixed.

292.—Psilomelan and Rhodonite mixed, the latter gradually changing into the former by oxidation. Free silica, and calcspar in sufficient quantity to effervesce.

293.—Rhodonite, with clear and distinct joining to psilomelan, into which it becomes beautifully transformed as soon as sufficiently "cooked," as the miners say, in the oxygen of the air. In Rhodouite, the manganese is Mn O; in psilomenon it is $Mn O^2$.

Mr. Bennett raises the query whether Rhodonite would not answer as well as pyrolusite for the manufacture of manganese iron. For making oxygen it will not do, as it is already in the reduced state to which pyrolusite is brought, after being divested of half its oxygen when put into the fire, or subjected to the influence of acids.

294.—Arsenical nickel, or red nickel pyrites, with hornblendic gangue, from a vein in the high Sierra in El Dorado County. Charles Evans.

295.—Casing to the above, of nickeliferous iron pyrites, and sulphuret of nickel.

296.—Ore of the Silver Cord ledge, Owyhee County, Idaho, consisting of dark red antimonial silver (pyrargyrite) and auriferous iron pyrites. This vein is three to seven feet wide, and the ore, found at a depth of 157 feet, assays $300 to the ton. Presented by L. G. Lewis, one of the owners of the mine.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

PACIFIC COÖPERATION RELIEF ASSOCIATION.—San Francisco. Nov. 23d. Trustees: H. A. Gorley, Theodore Cocknell, H. T. Graves, Henry R. Reed, C. H. Pollard, D. M. Gore, Albert Folsom, Joseph M. English, Thomas B. Leurs, S. P. Taylor, J. F. Michell, Wm. B. Lake and George L. Smith.

HENRY STREET HOMESTEAD ASSOCIATION. San Francisco. Nov. 23d. Capital stock, $39,600; 132 shares, $300 each. Trustees: R. J. Tiffany, G. W. Bunnell, J. H. Bucklie, H. W. Rappleye and T. B. Lewis.

POINT LOBOS HOMESTEAD ASSOCIATION.—San Francisco. Nov. 25th. Capital stock, $15,600; 48 shares, $325 each. Trustees: E. F. Clark, H. H. Noble, M. T. Brewer, H. Mahan, A. Mills, J. W. Nye and P. H. Blake.

ELECTION OF OFFICERS.—QUAIL HILL M. Co.—Nov. 25th. Trustees, Geo. W. Beaver, (President), A. J. Pope and W. E. Dean; Secretary, T. W. Colburn.

AMONG the marvellous improvements of the age is *inhalation*, for diseases of the head, throat, lungs and chest, recently introduced by Dr. Nestell, of the N. Y. Lung Institute, whereby healing vapors, at the natural temperature of the air, are inhaled from a crystal globe, thus going directly to the seat of the disease, and through the same door by which it entered. This is the only rational medicine, it strikes us, for transmitting those remedies orthodox with the accepted science, but in a subtle form, and a most powerful auxiliary for the alleviation and cure of respiratory affections. This theory, so opposed to the old, affords sufficient groundhope with invalids,—at all events, we arrive at that opinion from personal convictions, not mere observation and hearsay, and confidently commend it to the afflicted.

*

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, November 28, 1868.

City Stocks.

In reference to miscellaneous stocks the market is inactive. We note sales of Spring Valley Water stock at $65, and California Steam Navigation Company at 52½ per cent.

The receipts of the local insurance companies during the month of October and previously this year, according to the returns in the hands of the Internal Revenue Collector of this district, have been as follows:

	October.	Previously this year.	Total.
Pacific	$102,659	$636,046	$738,705
Union	28,035	212,526	240,561
National	.....	201,253	201,253
Fireman's Fund	20,794	178 029	198,823
Builders'	12,386	181 413	193,799
California	14,080	116 231	130,321
Merchants' Mutual Marine	28,864	173 187	202,051
Occidental	14,537	77,588	92,124
Home Mutual	12,111	101 020	113,131
San Francisco	.....	23,974	23,974
Peoples'	8,747	60.162	68,909
Totals	$242.222	$2,063,429	$2,305,651
Same time in 1867	236,977	1,730,182	1,967,159
Increase in 1868	$ 5.245	$333,247	$ 338,492

The returns were made upon a legal tender basis, the rate—72 cents for January, 71 cents for February, 72 cents for March, April, May and June, 70 cents for July and August, 72 cents for September, and 74 cents for October—being fixed every month by the Assessor of the district.

The National and San Francisco have disincorporated and their outstanding risks have been transferred to the London and Liverpool and Globe Insurance Company. The San Francisco disbursed a dividend of 2½ per cent. per month, or $7 50 per share, for the quarter ending with September 30th.

The above statement shows a decrease of $18,019 as against the receipts in September. The receipts of the several companies in October, as compared with September, show the following difference:

	Increase.	Decrease.
Pacific	$7,052	.....
Union	.....	$8,395
Fireman's Fund	.....	4,679
Builders'	.....	7,440
California	.....	7,284
Merchants' Mutual Marine	2 295	.....
Occidental	2,389	.....
Home Mutual	.....	2,065
People's	397	.....

The receipts of the city railroads for the month of October and previously this year, have been as follows:

	October.	Previously this year.	Total.
Omnibus	$27,480	$230 793	$258,273
North Beach & Mission	22,097	204,570	227,667
Central	15,186	129,902	144,088
Front Street, Mission & Ocean	8,272	76,981	85,253
Market Street	12,123	84,573	96,696
Potrero and Bay View	2,866	18,955	21 821
Totals	$89,041	$745,974	$835,018
Same time in 1867	79,108	607,860	686,968
Increase in 1868	$9,936	$138,114	$148,050

Showing an aggregate decrease of $2,142 in October as against the receipts of September. The receipts of October as compared with September show the following difference:

	Increase.	Decrease.
Omnibus	$338	.....
North Beach and Mission	.....	$365
Central	.....	1,037
Front Street, Mission and Ocean	.....	1,094
Market Street	336	.....
Potrero and Bay View	230	.....

The receipts of the San Francisco and San José Railroad were $49,823 in May; $51,425 in June; $52,502 in July, $52,663 in August; $53,148 in September, and $49,424 in October. The Mission Bridge Co. report receipts for August to be $1,201; for September $1,058, and for October $1,000.

Mining Share Market.

The market for mining shares during the past week has been characterized by increased activity, as well as by a rise of most shares constituting the general list at the Board. Advantage seems to have been taken of this by many who hold stocks which now rule at a low figure, and a considerable amount of this class, more than usual of late, changed hands. This activity, we think, will continue for some time.

The all-absorbing mining subject, at present, is the rich discoveries in the White Pine district, in reference to which we clip the following from a correspondent of the *Alta:*

"The most celebrated mine of all is the Eberhardt. So rich is this mine that its name has become almost synonymous with that of the cave entered by Aladdin. The location was made in December, 1867, and covers eight hundred feet, north and south. The present owners are Capt. Frank Drake, E. R. Sproule, Lavern Barris, J. W. Crawford and Edward Applegate. At a depth of twenty or thirty feet from the surface drifts have been run in several directions through solid masses of chlorides, bromides, sulphides and ruby and horn silver for twenty to fifty feet, and the end is not yet reached. The entrance to the tunnel has been closed, and admission to the mine can now only be gained by descending the vertical shaft in the company's building. Descending the shaft on a rope, we found ourselves among men engaged in breaking down silver by the ton. The light of our candles disclosed great black sparkling masses of silver on every side. The walls were silver, the roof over our heads silver, the very dust which filled our lungs and covered our boots and clothing was a gray coating of fine silver. We are told that in this chamber a million dollars worth of silver lies exposed to the eye, and our observation confirms the statement. How much may be back of it Heaven only knows. Astounded, bewildered and confounded, we picked up a handful of the precious metal and returned to the light of day. But for the bars of solid silver since shown us, we should be inclined to doubt the evidence of our senses, and look upon the whole scene in the chambers of the Eberhardt mine as the work of a disordered fancy, the baseless fabric of a vision. We had seen enough of the mines on this wonderful lode or line of deposits, and did not care to go on lower down the hill to examine the Silver Glance and other less noted mines. In the ore shed of the Oasis Mill, at Silver Springs, owned and run by the Eberhardt Company, we found 200 tons of Eberhardt second-class rock—the first class is so pure that it will not crush and is selected and laid aside to be melted down—and long trains of pack mules were arriving with more as fast as possible. The company will lay in as large a store of ore as possible before the snows fall heavily, in order to continue work all winter. One hundred and fifty tons of this second-class ore, worked at the Newark Mill, yielded $1,500 per ton, and it is supposed what is now being placed in the storehouses will yield as well. When General Page put up this mill at this point he had a contract to work the ores of the Eberhardt at $80 per ton until next spring. The proprietors found that he had a fortune in the contract, and bought the mill, which cost him $30,000, for $75,000. It has now run thirty-two days without stopping, and is rolling out the solid bullion daily. From a chimney in the Eberhardt ground $85,000 dollars worth of silver was taken in a few days, and the party taking it out then compromised with the Company, being allowed to hold all he had taken out and release to the Eberbardt Company the ground in dispute. This silver is now piled up in a cabin at Treasure Hill. The proprietors have $50,000 worth of similar specimens piled up in another place. One of the owners of the Eberhardt, but recently a poor man, values his interest at $1,000,000, and, we presume, the others would refuse to sell for less money."

Imperial—advanced from $100 to $112 50, and at the close realized $111. The sum of $3,086 has been added to the November bullion account since our last issue, making $22,054. On the 25th inst., the Imperial-Empire shaft was 1068 feet in depth. The drift east on the 900 level, near the north line, is in hard rock, and they are now within about twenty-five feet of the clay wall. On the 750 level they are near the clay wall, running in harren quarlz and porphyry.

Kentuck—improved from $232 50 to $250, then sold at $240, and closed at $245. The receipts of bullion for November account, to the 23d, foot up $28,429 43. The annual meeting of this company was held on the 25th instant. From the Secretary's concise report we glean the following:

RECEIPTS.

Cash on hand Nov. 21st, 1867	$20,365 03
Bullion	1,255,185 54
Premium on bullion	4,232 45
	$1,280,083 02

DISBURSEMENTS.

Dividends, No. 15 to 26	$450,000 00
Crushing Ores	448,323 60
Labor	161,293 62
Timber	54,738 55
Wood	12,114 05
Mine Expenses and Supplies	25,194 45
Assays	12,970 75
Hoisting Ores	11,544 46
Other Expenses	34,122 33
Cash on hand, Nov. 21st, 1868	63,862 21
	$1,280,083 02

From November 1, 1867, to November 1, 1868, 31,390½ tons of ore were reduced, showing an average yield of $40 06 per ton. The average cost per ton was $23 65, showing a net yield of $16 41.

Crown Point—was also sold at improved rates, selling within a range of $41 75@52 50, then at $47, and closing at $47. On the 22d instant, the stopes in the 850 level were looking tolerably well. Their average width will not exceed five feet. Near the south winze the ore body is said to be seven feet wide, but becomes much narrower in going north. They are sinking the shaft at the rate of a foot a day.

Gould & Curry—is in better request, rising from $85 to $120, falling to $104, and at the close selling at $100. On the 23d inst., they found a narrow seam of ore in the main shaft, assays of which show $3 30@6 30 per ton. The deposit lies due north and south, with a dip of 55 to 60 degrees. On the 25th, the seam was found to be forty-two inches in width.

Yellow Jacket—exhibits a very marked advance, rising from $1,165 on the 23d inst. to $1,560 on the morning of the 27th, and closing in the afternoon at $1,550. The *Safeguard* of the 21st, has the following in regard to this mine: "The winze intended to connect the 800 with the 900 level is now down 80 feet, and is reported to be in good ore, as is also the east drift on the 900, which reports have caused a general rise in stocks, being assisted by the now almost universal belief that a rise is inevitable. This company will hereafter pay regular quarterly dividends of $300 per share."

Savage—has not been as active as last week, selling at $68 50@72 50, receding to $69, and closing at $67 25....

Alpha improved from $40 to $48 50, and closed at $49. On the 20th inst., the raise from the 940 level was reported to look well. In the face of the east drift, 108 feet from the incline, have good "pay;" however, it is hard to extract, the "ore being in cemented quartz."

Chollar-Potosi—sold at $141@158, closing at $159. For the week ending November 20th, 1,200 tons of ore were extracted. On the 25th, assay certificates of hars to the value of $21,880, were sent forward to the office in this city....Overman advanced from $45 50 to $54, and closed at $50. The receipts of bullion by this company for the present month, from the 2d to the 24th, amounted to $38,594 54....Ophir sold at $23@32 50, and closed at $28. The shaft is now 544 feet in depth. Work had been temporarily stopped in order to lower the pump, but operations were again resumed on the 27th....It is thought that the second run of the Amador ore will yield $22,000.

The Steam-Decomposing Roasting Furnace.—From Mr. Stowe, proprietor of the Hagan cupola steam-decomposing furnace for roasting pyrites, we learn that another of these furnaces is at present being built in Calaveras County. The one near Cisco is waiting for a fresh supply of ores.

Christmas is coming, and the young folk should not forget the manifold attractions at Woodward's Gardens. They never were better. Now is the time to enjoy the beauties of nature at this famous retreat. *

He that hath ears to hear let him hear; but he that hath eyes to see and cannot see, let him use Muller's celebrated spectacles, 205 Montgomery street. *

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Name, Location, Amount, and Date of Assessment.	Day Delinquent.	Day of Sale

Symptoms of Character.—Dr. Stone's lecture on this subject before the Young Men's Christian Association, last Tuesday evening, was of general interest throughout. He spoke of the outcroppings of character through the lines of the face, the topography of the head, the dress, ornaments, and personal behavior of people—which are intuitively noticed and acted upon by children as well as adults. The new hall, which is a very comfortable audience room, was nearly filled. We congratulate the Association upon inaugurating the first successful course of lectures in this city. The price of admission is only 25 cents, or $1.25 for the course of twelve lectures.

Explosion in Casting.—At the Miner's Foundry last week the entire force of the casting department was employed at a casting for a portion of one of the State Capitol columns, weighing about twelve tons. Everything progressed successfully till the charge of molten metal had been drawn from the furnace into the mold, when from some cause, there was a sudden explosion, and melted iron, sand and dust were thrown in every direction. The foundry was instantly set on fire. An alarm was struck, but the firemen reached the place in time to extinguish the flames and prevent serious damage.

Personal.—A de Vial and Alexis Janin, recently students at Freiberg, Saxony, arrived here a few days ago. The former leaves to-day for Guaymas, Sonora; the latter goes to Virginia City.

The Rev. A. F. White, State Geologist of Nevada, is examining the mines at White Pine.

L. G. Lewis, owner in a dozen important mines in southern Idaho, is in town, on his way to the East.

Dr. Livingstone, the African explorer, is expected in England before Christmas.

E. B. Dorsey, M. E., has returned from a European tour of several years.

Removal.—Nelson & Doble, the agents for Thos. Firth' & Sons' renowned Sheffield steel manufactory establishment have left their former quarters on Pine street, and located themselves more advantageously at No. 15 Fremont street, near Market.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Nov. 14th: As near as we can learn, the treatment of the IXL ore at the Pittsburgh mill is not producing results creditable to the mine or mill. It is thought less than half the value of the ore is obtained.

One of the directors of the Morning Star mine, the ore which is being worked at the Pioneer mill, assures us that there will not be less than three tons of bullion from the seven tons of first-class ore already worked. When it is remembered that the ore assays 30 to 50 per cent. copper, and $200 to $400 in gold and silver, the above appears reasonable. The tunnel, at 1,000 feet from its mouth, and 250 beneath the croppings, struck a large volume of water, went through several feet of clay gouge and into a fine chimney of ore, from which was taken a large quantity of the peculiar black ore now known as first class, and more of a yellow pyrites containing some copper and gold, but not of much value. The black ore assays $200 to $400 in silver and gold, and $100 in copper to the ton. Another level 100 feet below that of the tunnel was reached last winter; the black ore was found the same, except more disintegrated, but still the class, not clearly black, or No. 1, is largely in excess. We find now that almost every lump of the class hauled as No. 2, exhibits in breaking considerable gray, and not a little of the rich black ore; that a new substance, different from any found above, which cleaves easily, contains considerable crystallized quartz, and an ore which seems fine, rather on the silver sulphuret order. The gray metal which is coming in largely with the pyrites, seems to be identical with samples found in the Wild Yankee and American, on the same range.

Chronicle, Nov. 14th: Work is being prosecuted with energy on the Scottish chief. The tunnel is now in 212 feet, and has cut several strata of fine looking quartz.

Amador County.

Jackson *Ledger*, Nov. 21st: The Oneida, Kennedy and Coney & Bigelow are all running, and crushing rock to their utmost capacity. The returns from these mills for the past month have been highly favorable.

Work is being pushed on the Summit mine.

The Kennedy Quartz Mining Co. have deposited in the show case of P. Reichling, a beautiful specimen of their quartz. It will go $10,000 to the ton, and had it been found at White Pine, or any other bleak, cold, distant part of the Pacific coast, an intense excitement would have been the inevitable consequence.

Calaveras County.

Mokelumne Hill *Chronicle*, Nov. 21st: Operations in gravel mining are being pushed forward vigorously in this vicinity. In Chili Gulch, Brackett & Co. have nearly completed the prospecting tunnel which they have been for some time running, and will soon be taking out the precious metal again.

Mr. Shaw, the "Guy" claim man, is washing away Stockton ridge as fast as a huge hydraulic will permit.

Mattbews & Co. are "pushing things" night and day, with very flattering success. As the result of 48 hour's run, they cleaned up $250.

Paul & Co. have one of the most extensive gravel mining claims in the county, and are employing a large number of hands. They are now reaping a liberal reward for heir energy and perseverance.

The Golden Gate Co. having completed their new mill, are now crushing very rich gravel. Their claim is thoroughly prospected, developing an immense body of pay dirt.

Quartz mining is progressing as favorably as one could wish. The claims are all so well protected from the weather that the commencement of the rainy season will not interfere with the steady prosecution of labor.

The Collinsville correspondent writes: Work on the Monitor and Merrimac has been suspended for a time, on account of the insufficiency of the machinery; but will be resumed again as soon as the companies can make arrangements for the necessary machinery, which they expect to do in a short time.

At Central Hill there are several claims being worked, all paying fair wages. I think that the mines are doing about as well here as any place I have been.

The Lower Rich Gulch correspondent writes: The Palomo has become a paying institution. In the north or whim shaft, now 100 feet deep, they have the whole ledge in sight. It is seven feet in width, and prospects better than any ore previously taken from this mine. In the south shaft, levels are being run by contract, north and south. Where this shaft was sunk there was a break in the ledge; in the north level it is coming in, and is now about four feet wide. The south level is just commenced, and without doubt a very large body of ore will be found within 30 feet of the shaft. From the center shaft, levels are being run either way to each of the other shafts, for the purpose of a thorough ventilation of the mine.

Alexander & Co. now have a ledge over 18 feet wide, evidently rich, both in sulphurets and free gold, and easily mined.

Mariposa County.

Gazette, Nov. 20th: The editor who has been visiting the mines in Buchanan Hollow, gives us the following items: The main features of the place are its rich and extensive copper mines which are now being worked by Vilas & Co. Their main shaft is down 230 feet, with a tunnel running south about 100 ft.; another known as the South shaft, is down over 80 ft., in which a vein of ore nine ft. in width has been struck. The ore is mostly sulphurets, yielding 24 to 25 per cent. of metal. Hoisting works are being erected at this shaft, which will be in operation in a few days. From 15 to 20 tons of ore are now taken out daily, and from 25 to 50 tons are the weekly shipments at present. They are running another tunnel which is now in 210 ft., with most promising indications. It is the intention of the company to haul their ore some 25 miles to a point on the San Joaquin river accessible to steamboats. The furnace of the establishment is not yet in operation, but will be in readiness by next Monday. About 90 tons of roasted ore are now at the furnace and a pit of 80 tons nearly roasted, and another under headway to contain 130 tons of which they intend to make matte. The furnace is estimated to run through about 20 tons of matte per day.

Nevada County.

Transcript, Nov. 18th: The Little York Water and Mining Co. have purchased the interest of J. E. Squire in the concern, and also the mill and mining property formerly owned by Curran & Buckman. The new company paid $11,500 for the Curran & Buckman property. They have been exceedingly successful since they commenced operations, and are preparing for extensive work during the approaching season. They are getting four sets of hydraulic claims in condition for work.

The Central Mining Co. have located 1,100 ft. on the Black Jack quartz ledge, situated near the Coe mine. The claim of the company includes 100 ft. on each side of the ledge for mining purposes.

The Perspiration Co. have located 700 ft. near the Snow Ditch.

Ira Bean and others have located 700 ft. on Pan ravine, for gravel mines.

Nov. 19th: The Erie Co., on the Jim Crack ledge, is located at South Fork, three miles from Eureka. Two shafts have been sunk, one 100 and the other 83 ft. in depth. They are now running a tunnel to connect the two shafts. The ledge is from five to eight ft. wide and the rock of excellent quality. The mill has two 5-stamp batteries and is run by a 50-horse engine. After a run of 36 hours the battery was heavily coated with amalgam. The rock heretofore worked has averaged $20 to the ton, and that upon which they are now running shows better than ever. The mine is being thoroughly opened for permanent work.

A great deal of prospecting is being done in the vicinity of Eureka, and the miners are greatly encouraged. Many of the mines give promise of great richness. Black & Young's mill is kept in operation night and day. Palmer & Everingham's mill is also running and the Commercial mill. At Eureka and South Fork seven or eight mills are kept running.

The North Bloomfield Gravel Mining Co. are pushing work upon the ditch. They have in the vicinity of Eureka a company of 200 Chinese and are working all along the line.

Nov. 20th: The Norridgewalk mine is to be worked again. The shaft will be cleared, the rock at the mill crushed, and if the result is sufficiently encouraging work will be continued.

Nov. 21st: The coming season, with favorable weather, will be one of extensive hydraulic mining. Many of the claim owners are already prepared for work, and are only waiting for water. Others are actively engaged in preparations and will be ready to take advantage of the first supply. During the past two or three years a large quantity of ground has been located in the county, and some of these claims will be worked this season. In various localities claims have been sold to companies having abundance of capital to fit them up and work to the best advantage. This class of claims will begin to yield this season. There is every indication that the winter and spring will be most prosperous for hydraulic miners.

Grass Valley *Union*, Nov. 19th: Frank Morse who is working the Hitchens & Larimer ledge under a lease, has come across some of the best rock ever taken out in Grass Valley. A gentleman who has been connected with quartz mills since Grass Valley had a mill, informs us that he never saw such rock.

Nov. 20th: The Scandinavian mine, in Rough and Ready township, will, it is supposed, be again worked soon.

Nov. 21st: The rock coming out of the Empire mine yesterday and the day before, is exceedingly rich, in fact it is regular specimen rock which will run up into the thousands per ton.

Nov. 22d: Wm. Bovee, who resides in this place, has struck a new quartz ledge, which gives promise of being valuable. Some years ago a Frenchman struck this ledge which is near the corporation line, on the Nevada road, but it looked so white and unfavorable that work on it was abandoned. Bovee run in a tunnel lately, to find this ledge, but run above it. Discovering this he sunk a shaft for it, and a few days since, struck a two feet thick ledge which shows free gold, with galena and sulphurets in profusion.

Grass Valley *Nation l*, Nov. 21st: Russell & Co. are now engaged in sinking a shaft under contract on the Aspinwall ledge. The contractors are now down 107 feet on the ledge, which is over three feet thick in the bottom of the shaft. The ledge runs northwest and southeast and has been traced over a thousand feet from the shaft, where it is found to be 18 inches thick. Some of the rock from this mine is now being crushed at the Gold Hill mill, and more than comes up to expectations.

A much better quality of rock is now being taken out of the west level, 200 ft. on the incline, in the Coe mine, than ever before, and as the sinking progresses we may expect to hear of still richer rock being taken out. The rock looks well—showing an abundance of rich, heavy sulphurets and free gold.

Transcript, Nov. 24th: Last year many of our miners had sufficient water to commence work by the end of the first week in November. This season is much later, and as yet none of the hydraulic miners have commenced operations.

The Providence Mining Co. have located 2,000 feet on the Grass Valley quartz ledge.

EXCELSIOR.—Truckee *Tribune*, Nov. 21st: The Mohawk and Montreal Co. are running their mill night and day with flattering results. They have enough good ore in sight to keep the mill running all winter steadily. The company are now working about forty men. The Independence Co. are engaged in getting out 100 tons of rock, which they will have worked at the Mohawk mill. The U. S. Grant Co. have four men employed in drifting on their ledge. The ore now being taken out is said to be of a good quality. The Kentucky is now idle, and the Enterprise Co. have closed for the winter, on account of the difficulty of getting ore to the mill. Connell & Co. are engaged in getting out a large quantity of ore which they will have worked at the California mill. The last crushing from their mill paid splendidly.

Placer County.

Auburn *Herald*, Nov. 21st: The new Pioneer Quartz Mill, on the Mammoth Ledge, on Dry Creek, is now running, but has not made a clean-up.

The new 20-stamp mill, now being erected on the Green Emigrant, on Bald Hill, will be completed and running in about three weeks.

Plumas County.

Quincy *National*, Nov. 12th: We hear it rumored that a nugget valued at $500 was taken from a claim on Blackhawk a few days since.

Turner, Reynolds, Rice & Co., whose claims are located on Blackhawk, have diggings which are rich enough for any moderate men, and they have ground enough to last them for years. They made some large clean ups while piping off top dirt, during the spring and early part of the summer, and since they commenced cleaning bed rock, they have averaged about 60 ounces per week. They have a fine water privilege, and everything bids fair that the claim will pay as well for years to come as it has the past season.

The North Fork correspondent writes: McBeth is working his mining claim, on Marion Flat, with good success. Boston & Balliett are getting excellent pay at Bamboo Bar. There is very little mining being done in the river above the cañon this year. On Dutch Hill the boys are working away about as usual. The Dutch Hill Co. are working in their tunnel, taking out good wages. Ferguson & Wagoner are running a bedrock tunnel into their deep ground, where they expect big pay. Mechlin is running day and night, on good prospects. At Red Rock the miners have been fitting up their claims, and are about ready for the spring run of water. They have good ground, and all they want is plenty of water to make it pay well.

The Taylorville correspondent says that work will be carried on this winter on the Enterprise lode.

Sierra County.

Downieville *Messenger*, Nov. 21st: The Fir Cap gravel mining company struck through into pay gravel on Sunday last.

Contracts have been made which will insure the completion of the Garden Valley quartz mill this winter, so as to be put in working order in the spring.

Siskiyou County.

Yreka *Union*, Nov. 21st: Some two months since we spoke of a quartz ledge on the north Fork of Humbug, which Lash and Weston had just then discovered. The ledge is in the steep hills on the south side of the North Fork, nearly opposite the site of old Freetown. Since that time about 50 tons of quartz have been taken from the ledge and crushed, yielding $25 to the ton. An open cut has been made on the ledge where it crops out, extending along it about 15 feet, and going down on it to a depth of 10 or 12 feet. It is about 20 inches in thickness, and is easily worked. This, taking into account both the thickness of the ledge and the quality of the rock, may justly be regarded as the most promising quartz prospect yet struck in this section. They have christened it the Accidental.

Tuolumne County.

Sonora *Democrat*, Nov. 21st: A piece of gold worth $130 was found on Tuesday by Henry Eckel, of Springfield. He found it in the lot upon which stood Wedel's old brewery, adjoining Hurley's Saloon, which he is now mining.

A gentleman from 1st Garrote informs us that the Burns mine is being worked and the mill kept running day and night. Also, that the mine is paying well.

COLORADO.

From the Central City *Register*, Oct. 29th: The Hicks lode has a crevice between walls five ft. in width, with quite a promising vein of pay ore. The discovery shaft is only about 13 ft. deep, but quite a quantity of ore has been taken out for that depth. At the time of our visit six sacks of good looking ore were lying at the shaft, apparently waiting transportation to a mill. Beside these, there was half a ton or more of selected ore lying in a pile at the shaft. Near this lode Jacob Snyder has several lodes that he is working, the ore from one of which has run $124 coin at Huepeden & Wolter's mill....S. Robeson showed us this morning some very rich samples of ore from the Ruby lode. One specimen contained native silver in considerable quantity, and all the samples showed ruby silver and black sulphide thickly blotched through the whole rock. Mr. R. reports all the lodes yet discovered there as being very wide and the ores quite rich—black sulphides and ruby silver being the prevailing ores.

Denver *News*, Oct. 30th: The Clear Creek correspondent writes: Nevada City is surpassing her glory of '60. Ten large quartz mills make music throughout the gulch from Monday morning to Saturday night. Taking Gilpin County throughout, things were never so prosperous or times so encouraging as now. They estimate 40 mills in operation, with a capacity of 800 stamps, crushing between 3,000 and 4,000 tons of quartz every week, with good results.

There are no mills running at present in Russell Gulch. Mr. Reed expects to have the Ford mill running soon on ore from the Delaware lode. The only mill running in Leavenworth Gulch is the Leavenworth, which is crushing ore from the Alps mine, with 12 stamps. Mr. Mitchell is also running 32 stamps on ores from the Illinois lode on Quartz Hill.

IDAHO.

World, Nov. 14th: A gentleman just in from the new diggings on Salmon river, says: There were about 40 miners at work in the new camp, and it has been organized under the title of Salmon district, No. 2. It is about 20 miles below the old Salmon diggings, on the banks of the river, and the claims will pay very good wages.

Owyhee *Avalanche*, Nov. 14th: The Rising Star mill is rapidly nearing completion. Louis Alpey has made a rich discovery on the mountain above Slaughter House Gulch, he has christened it the Minnehaha. The ledge is from 18 inches to four feet in

width, the ore bears a striking resemblance to that of the Poorman, and pans out marvelously rich.

The Boise *Democrat* says that two miners are making from $5 to $8 per day with a rocker in a claim on Boise river, about 10 miles above that city.

MONTANA.

Helena *Post*, Nov. 6th: W. D. Wann is taking out a large quantity of very rich ore from the Watseka lode in Rochester district. He expects to commence operations this week. The Hendrie mill has never failed of a good run from this ore, since it commenced operations last summer.

The furnace of Tootle, Leach & Co. at Argenta is at last in full blast, and with the most flattering prospects. It is smelting ore from the Tuscarora and Stapleton lodes, of which the Stapleton is in every respect one of a superior character. The rock is being got out rapidly, and enough is in sight to run on all winter.

We learn that Brown's Gulch, one of the most promising quartz districts in Montana, is now the scene of busy development. Some 50 men are at present engaged on three of the leads, developingand crushing with arastras, with gratifying results.

We have also learned that Lincoln Gulch never appeared to better advantage than it does at the present time. The claims are all paying wages, and from Mr. Allen's sluices, in one week, we are informed, $1,000 was cleaned up. Quite a number of claims are paying splendidly, and all average quite well.

The Virginia *Democrat* says: The Clark Mining Co. have stopped work for a season, the water having given out....The furnace of the Great Western Mining Co. will be ready to start in a few days on quartz belonging to the company....Strong hopes are generally entertained that Mill Creek will be one of the most extensive districts of the Territory.....Messrs. Sissier, from a battery of three stamps, in three days' run, cleaned up $500 worth of retort.

The Deer Lodge *Independent* says: We were shown some specimens of quartz by Mr. Harvey, from the Myer's lode, which is making more than wages crushing the rock in arastras; one day it yielded $126. ....Lincoln Gulch continues to improve, new diggings have been discovered, as high as $3 to the pan was taken out of one claim. ....There are four mills running in Deer Lodge County, which are producing in the aggregate over $100,000 per month....The Hershfield mill, after running five days on the Thomas lode, cleaned up nearly $4,500. Take it all in all this country never was in a better condition.

NEVADA.

Esmeralda.

Virginia *Enterprise*, Nov. 17th: Wells, Fargo & Co. yesterday morning shipped from their office in this city, two gold bars from the Wheeler & Wilson mine, Pine Grove, worth the snug sum of $19,754.13.

Humboldt.

Winnemucca *Argent*, Nov. 21st: In the Pride of the Mountain ledge, in Winnemucca Mountain, it is quite common to find horn silver. Several tunnels of lengths varying from 25 to 70 ft. have been run in on the vein, and an incline of 110 ft. is sunk on it. Incline and tunnels all show a well-defined vein of from ten inches to two and one-half feet, and a continuous streak averaging about one foot of a black mineral, through all of which is distributed horn silver.

The vein is found for over 2,000 ft. Two tunnels are now being driven. Stoping has commenced in the upper one, and it would be difficult to find richer ore than comes out.

Reese River.

Austin *Reveille*, Nov. 13th: In spite of the lateness of the season and the near approach of winter, with its snows and frosts, the travel to White Pine has assumed the appearance of an old-fashioned rush.

Some 3,500 ounces of bullion arrived in this city yesterday afternoon from Rigby's mill at San Antonio.

Nov. 16th: On Saturday 14 bars of bullion, of the average fineness of .992, and valued at $20,403.18, were brought into this city from the Centenary mill in the district of Newark. The bullion is the product of White Pine ore, and is the finest lot ever brought into this city.

Nov. 17th: Yesterday afternoon four bars of bullion, .975 fine, and valued at $5,273.60, were brought into this city from the Monte Cristo mill at White Pine.

Nov. 19th: The Virginia mine, situated near the town of Hamilton in White Pine, was sold to-day for $36,000 in coin.

Nov. 21st: The amount of bullion produced at the Manhattan mill for the week ending this date is 43,928 ounces.

Virginia *Enterprise*, Nov. 18th: A correspondent at White Pine writes as follows: The rich specimens that go abroad from here are from the Eberhardt and the mines in that vicinity. It is a fabulously rich mine. But little work has been done in it, and yet there are now in sight many millions worth of ore. I was through the mine to-day; saw it all; but it's no use for me to describe it to you, for I can't do it; and if I could it wouldn't do any good. Chloride Flat is on the western side of the mountain. The pay rock underneath it is covered by a layer of limestone, varying in thickness. Some fortunate prospector struck rich ore near its surface and near the center of the flat, and from that location holes radiate in all directions, with varying success. Some have it, and some have it not. On this flat there are at least 100 shafts. It looks to me as if there are about 500; but Steve says 100. Many of them are taking out rich rock, but not all of them are doing so, by any means. As I said before, the cap of limestone varies in thickness. All who have gone through it have reached pay ore; but all have not gone through it. Many have become discouraged and quit. The pay ore appears to run up in chimneys, and lucky is he who strikes one of these. Steve made two locations on this flat, in one of which he put us. He went to work on his claim, and in 15 feet struck good ore that will assay from $500 to $1,000 per ton here; but what it will assay and pay at the mill is a matter yet to be settled. The value of the ore obtained on Chloride Flat is somewhat exaggerated, but still it is very rich rock. I think the flat will yield a vast quantity of ore that will pay at the mill from $75 to $100 per ton; but when it is set away above that, choice rock is selected. Ned Hudson is working a claim on the flat, and two tons of selected ore which he sent to the mill and had worked, only paid him $225 per ton. It is very expensive getting at this ore through the limestone, and very expensive getting the ore out after getting at it. The limestone is very hard, and requires a great deal of blasting, and so it does to get the ore out after reaching it. On an average, it requires the labor of at least three men to obtain one ton of pay ore per day. Then it costs $50 per ton to get it crushed, and from $5 to $7 to have it hauled to the mill, to say nothing of the expenses of sacking, etc. This is the queerest region that any white man ever beheld. This whole hill, after going through the limestone, seems to be a body of silver-bearing quartz, and it seems to make but little difference where a man goes for it. He is about as liable to get it at one place as another.

Another correspondent writes under date of Nov. 12th: The further the work on the Eberhardt proceeds into the ledge, or chimney, the better grow the indications of this very rich ore. Few, if any, of the stockholders in this claim care to sell. They consider that they have a mint to back them. The Oasis mill, located at Shermantown, about one and a half miles from the mine, is crushing the ore. It is a 10-stamp mill, well arranged, running day and night. At the time of our visit, the mill had been running 22 days. As near as could be estimated, $80,000 had been taken out. In the office we counted 23 bars of bullion, averaging $1,500.50 each. Though greenbacks were at par, the moral effect of their equivalent in good hard cash is much greater. Alongside the mill lies 150 tons of ore, which turns out from $800 to $900 per ton. We are informed that ore has been selected from the same claim—the Eberhardt—which assayed as high as $18,000, and even $20,000 per ton. At all events, this mine bids fair to yield ore worth from $500 to $800 per ton for a long time to come.

The Keystone and Richmond, adjoining the Eberhardt, are also rich and valuable claims. The Anrora, as well as other mineral discoveries near Treasure City, upon what is termed Chloride Flat, are worthy of mention, though yet in their infancy. Treasure Hill abounds in prospect holes, and a number of mines have been opened and are being worked to some extent, which promise well and may yet prove rivals of older and more developed claims. Upon this Chloride Flat all precedents in regard to deposits of silver ore seem to be disearded. The ore is scattered in a haphazard manner, being found unexpectedly here and there, or, as miners term it, in pockets. Usually the ore is struck from five to ten feet below the surface, immediately under a cap-rock of limestone; yet in this locality the arrangement is very irregular, and one finds prospect holes going down in all directions, apparently after a most blind fashion. Prospecting is continually going on. Every day brings fresh reports of new discoveries and new ledges. The latest rumor tells us of rich gold-bearing quartz some 50 miles from this point. Doubtless much mining will be carried on during the coming winter, but the work will be small compared with the numbers flocking in who are without means, provisions or shelter. Next spring will be early enough for all who come to mine, prospect, or those without means who depend upon obtaining employment, capitalists, especially those intending to locate in this region next spring, for mercantile or mechanical businesses, are already well represented.

Nov. 21st: We were yesterday shown a small bar of bullion, weighing 2.54 ounces and worth $7.26, which was taken from a pound and three-quarters of White Pine ore. The ore was melted and the assay made by Conrad Wiegand, of this city, and shows that the ore smelted contains at the rate of over $5,000 per ton, and a ton of such bullion would contain over $50,000 in gold. Unfortunately it is not known to a certainty which of the several White Pine mines may contain this gold rock, as the lot melted up was the fragments from a number of specimens brought in from that section by a gentleman of this city. Mr. Wiegand says that he found about the same proportion of gold in another lot of White Pine ore which he smelted. The companies owning the rich mines on Treasure Hill have supposed their bullion to be purely silver.

At Kirk's drug store, South C street, is to be seen a huge specimen of White Pine ore received yesterday from White Pine. It weighs over 100 pounds, and is supposed to contain from $80 to $100 worth of silver. The express charges on the lump from White Pine to this place amounted to $28. The specimen was taken from a claim adjoining the famous Eberhardt mine.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Nov. 20th: Greely Brothers, of the Fulton Foundry, on the Divide, are constructing machinery for a new mill for Augustine, of Silver City. The new mill is to be erected at American Flat, and will be run upon a large bank of tailings lying below the old Bay State mill, on the Flat. No stamps will be required in the mill, and the machinery will consist mainly of four large amalgamating pans and the engine required to run them. They are also furnishing machinery for new hoisting works for the South Yellow Jacket's works, and have already delivered a portion of the same. That delivered consists principally of spur wheels, twelve of which, six large and six small ones, make up the bulk of the machinery.

Nov. 21st: The Summit mill is again in operation, crushing ore from the Sacramento mine, on Cedar Hill.

We are informed that the ore in the lower level of the Alpha mine is improving very considerably both in quantity and quality. The lower level of the Yellow Jacket mine is also looking exceedingly well.

There was shipped by the express from this city and Gold Hill during the past week, 6,102 pounds of assayed bullion, valued at $193,919.40.

A small streak of rich ore, some four or five inches in width, has been found in the 900-foot level of the Crown Point mine.

Gold Hill *News*, Nov. 16th: There was shipped from Wells, Fargo & Co's Gold Hill office this morning, six sacks of bullion, weighing 411 pounds, and of the value of $12,256.30.

NEW MEXICO.

Santa Fe *Gazette*, Oct. 31st: Within the last 12 months valuable discoveries have been made in the upper as well as in the lower portion of our Territory. Every known precious mineral is represented in our vast mountains. A rich gold discovery has been made by the "Arroyo Hondo Mining and Ditch Co." in the mountains close to Fernando de Thos. The specimens shown to us by Adolph Guttmann, of the above named company, are immensely rich, the gold can be distinguished with the naked eye, throughout the quartz, and we do not say too much, in pronouncing them the best looking gold specimens that ever came within our sight, from the mines of this country. We were told that the vein is from six to eight feet in width, and widening as they go down on the same. The quartz resembles very much the white California crystalline quartz and has until now prospected very well and improved every day in richness. The company is now engaged tunneling into the hill, and intends to bring out early in spring a 20-stamp mill. The immense and rich deposits of gold, silver and copper ores throughout our mountains, could in very little time be made to yield treasures to earnest and enterprising men.

OREGON.

The Jacksonville *Sentinel* says: Important discoveries of ores are being found in various localities of Coos and Curry counties. Quite an excitement is now agitating the people of these counties, in consequence of the discovery of a rich gold-bearing quartz ledge at Salmon Gulch, northeast of Port Oxford. A rival company, supposed to be in the interest of San Francisco capitalists, are pretending to claim the ledge as a spur from an unknown and imaginary one of theirs, which will probably lead to litigation. Some silver and copper ores have been found in various localities of Curry County, which will ultimately prove a fine field for the miner and the mineralogist.

The Yreka *Journal* says the Goose Lake country is fast settling up, and good prospects for gold mining are reported about the headwaters of Sprague's river.

Enterprises and Developments.

A Steamboat for Salt Lake.—The Stockton *Independent* of Nov. 14th, says: Gen. P. E. Connor has built on the river Jordan, and ready to be launched, a steamboat to ply on Salt Lake. The machinery for the steamer went from California, but everything else necessary for the equipment of the boat was furnished on the ground. During the winter the steamer will be used for towing ties for the Union Pacific Railroad, but during the coming summer it will be fitted up for the accomodation of passengers.

There is a keen rivalry between Wells, Fargo & Co. and the Pacific Union Express Company at prominent point in the interior.

A buckskin glove manufactory at Grass Valley is said to be doing a good business.

During the past ten months, or since January 1st, Davis & Cowell, at Santa Cruz, have shipped 69,350 barrels of lime—an average of 6,935 barrels per month. Thirteen schooners and three steamers run regularly between Santa Cruz and San Francisco. Ninety-four trips were made by these vessels during the month of October.

Richard Trelfall, of Livermore Valley, has farmed 7,000 acres of land, and is still engaged at threshing.

About 1,000,000 feet of lumber has recently been shipped to Shephard's Ferry, on the San Joaquin river, where a town of of considerable size is expected to grow up.

The receipts of the Oakland and San Francisco Railroad for October amount to $20,742.

Lyons, Michigan, has 100 acres of peppermint under cultivation, and has made this year 1000 pounds of pure oil, and is still at it. The oil is worth $8 a pound.

Laws of Growth of the City of San Francisco.—A writer of occasional very valuable articles in the *Bulletin* sets down the annual growth of San Francisco at 10 per cent. compounded; that rate having proved the law for ten years past, and being likely to hold good for at least five, if not ten years more. The immediate future is forecast thus:

1868	143,000	1871	189,000
1869	157,000	1872	207,000
1870	172,000		

The actual increase the past year has been 13.1 per cent.

Vallejo Railroad Wharf in the City. The California Pacific Railroad Company have secured from the State Harbor Commissioners that portion of the new water front on the easterly side of Front street, extending northwardly from Vallejo street 325 feet, with a uniform depth of 60 feet. The portion of the water front next north to Cunningham's old warehouse, is secured by Mr. Campbell for grain purposes.

Commercial Fertilizers.—An association has been formed in England for the purchase of super-phosphate at the lowest rates, and to discourage all other kinds of commercial fertilizers.

Advertising Bell.—A Detroit editor has invented a bell to be attached to bulletin boards, walls, fences, and so forth, to attract attention to the advertisements pasted thereon. It is operated by a coiled spring with clockwork gearing, and when wound up and set running it will sound at intervals of a few seconds continuously for a week, if desired.

We should not guarantee but that some of these machines would be served with an injunction occasionally in a popular way—with a convenient brickbat, perhaps.

MINING AND SCIENTIFIC PRESS.

W. B. EWER,.....SENIOR EDITOR.

W. B. EWER. A. T. DEWEY.

DEWEY & CO., Publishers.

OFFICE—No. 414 Clay street, between Sansome and Battery.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR L. G. YATES, California.
S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, Nov. 28, 1868

Notices to Correspondents.

J. B. T., Petropolis, Snowy District, Los Angeles County.—This correspondent informs us that he has a large body of asbestus, having the general features, color, etc., of rotten oak wood. Our informant further states that he can chew this substance into a pulp, resembling paper pulp, and conceives that it might be manufactured into an incombustible article of that class. From the statements given, we should doubt whether the mineral so described is true asbestus, its usual somewhat brittle filiform character unfitting it for making paper pulp. If, however, the mineral under notice could be manufactured into paper in the manner suggested, its indestructibility from fire would be of little economic advantage for written or printed documents, unless the ink to be employed in such cases is indestructible by the same agency. For making room paper, however, a paper so constituted might be found valuable in cases of fire. If our correspondent's asbestus is sufficiently filiform to make cloth, we would suggest that lamp-wicks, such as those employed in burning the lighter forms of coal oil, might be very advantageously manufactured of it.

T. S. M.—Equal volumes of different gases or vapors do not always correspond to the same number of equivalents; or otherwise stated, the equivalents of different substances, when gasified, do not fill an equally large space, hence the equivalent volumes of gases and vapors are of different size. These gaseous volumes, however, always bear to each other a simple ratio, such as 1 to 2, 1 to 4, etc., the difference being subjected to known laws.

B. L.—ISOMORPHISM.—Gay Lussac was the first who made the observation that a crystal of potash-alum on being put into a solution of ammonia-alum, continues to increase without changing its original form. This illustration was the foundation of the observations made thereafter by many experimentalists on the phenomenon which forms the heading to this paragraph.

W. Q. J., Yreka.—There are instances known in which the expansion of gaseous bodies favor their combination with others. Thus, phosphorus undergoes slow combustion in oxygen gas however low the temperature may be, the action becoming more rapid as the gas becomes more rarefied. A mixture of oxygen and non-inflammable phosphuroted hydrogen gases explodes on expansion.

COPENHAGEN.—Stoichiometry is a term employed by the continental European chemists to denote the doctrine of chemical proportions or chemical equivalents. The word was first employed by German chemists, and is now used chiefly by them.

A YOUNG MINERALOGIST.—Chalcedony is a mixture of quartz and opal; boiling caustic potash will dissolve out the latter, leaving the former in a state called "cacheloug."

Chemical and Metallurgical Establishments.

THE SAN FRANCISCO CHEMICAL WORKS.

There is at the Mission another chemical manufacturing establishment of importance, which is the oldest in the State. This is the Judson Bros' establishment, known as the San Francisco Chemical Works; where sulphuric, nitric, and hydrochloric acids, besides sal soda, bluestone, and some of the materials required in the manufacture of soaps and candles, are also manufactured. As ventilation is most necessary for the health of the employés engaged in an acid manufactory, no care has been taken to keep the walls of the wooden building near Folsom street, in repair, but the operations are found to be going on all the same. As early as 1854—fourteen years ago—the manufacture of acids was begun at this place; it continued for a long time to be considered as located in the "country"; but the houses crept up to it apace, and it is now unquestionably in the city.

The originator of the enterprise was Mr. Mayer, an old preacher who was also a good chemist, of Philadelphia, supported by Dr. Coon. Mayer got in debt, and Mr. Egbert Judson became interested in the enterprise, first coming to the rescue with funds, and afterwards taking charge of the entire business.

In those early days it was difficult to get the materials which were required for an acid factory. A lot of ornamental Chinese flower pots of immense size, came to San Francisco on a bad speculation, and were turned by Mr. Judson into acid condensers, by luting them at the top and connecting them with pipes. They are now used for other chemical purposes, their finely executed ornamental designs begrimmed with virulent fluids, furnishing an odd reminiscence of the eventful past. For seven or eight years all the acids for the mint were manufactured here—until 1865, when Mr. Wakelee started the Golden City Works, and put in a lower bid to furnish the acids than the Judsons thought they would be justified in doing. At present they are making nitric acid for the new Giant Powder manufacturing company. Sulphuric acid is made on a considerable scale, the lead chambers and other appliances for that purpose being simply and economically arranged. Both these acids and hydrochlorie acid, are made as described in connection with the Golden City Works.

Sal soda, or carbonate of soda, is made here, not from the remnants of nitric and hydrochlorie acid manufacture, but from soda ash, derived from England. This is done in a separate department, under persons who are especially familiarized with the method. Lye is put into a row of tubs, and the soda crystallizes on the surface, looking like ice; underneath it are very large monoclinic arrow-head shaped crystals, having edges as sharp as a razor. About 1,700 lbs. a day are manufactured. The price of imported soda formerly was seven cents a lb., but when this business was started the importers cut it down to their lowest figure, in order to starve out the home manufacture; the price being now 2½ cents. The principal use made of sal soda is for washing powders.

The natural soda or alkali which is found incrusted plentifully on the alkali flats in Nevada and Utah, is also monoclinic in crystallization; it is called Trona, or prismatic natron when a sesqui-carbonate, and natron when an equal carbonate, the latter being the "nitre" of the Bible; but the distinction is not easy, and unimportant, practically. Gay Lussite and Thermonatrite are qualitatively the same as Trona.

Copperas, or green vitriol (sulphate of iron) is made to a limited extent, of old rusted sheet iron, with sulphuric acid. It is used for a variety of purposes.

A candle manufactory is carried on by the Judsons at a little distance from the chemical works, where 100 boxes of very superior candles are made daily; and they have also a silver and gold refining establishment in the vicinity of the Naval Hospital, which will be spoken of in connection with the other refining works.

Idaho Brought Near to Us.

NORTH AND SOUTH INTERIOR RAILROAD.

By means of a nearly level road, according to reports, between Argenta and Flint City, Idaho, now in progress of construction, that important mining center, embracing, with Silver and Ruby cities, the chief metalliferous and timbered section in Idaho, will be brought within nearly the same traveling distance of San Francisco as Austin and Belmont, Nevada. More definitely speaking, it will be only about one hundred miles by this new route, through an easy pass in the South Mountain, from the Pacific Railroad to the metalliferous heart of Idaho.

Argenta, it would thus seem, is to become the junction of two most important branches of travel, which in time will become one road, and a railroad,—running north and south between the hills and along the alkali flats of the "basin." There is more demand, and more reason for the construction of such a road in the longitude of Austin, southward towards the Colorado, to open up and develop the rich regions of the eastern slope, or northward to the convenient waters of Snake River, which just there makes a great sweep to the south, as if on purpose to accommodate the mining interests of that important belt, than there is in the longitude of Salt Lake; for railroads must go where they are needed, as well as where they can be easily constructed.

STATE PREMIUMS.—The Board of State Judges on Agricultural and Manufacturing Premiums, consisting of Gov. Haight, Reed, President of the State Agricultural Society, Hallidie, President of the Mechanic's Institute of San Francisco, Parks, President of the Northern District Agricultural Society, and Doake, President of the San Joaquin Agricultural Society, have awarded to several parties premiums, under the law of 1868, for raising cocoons. That law allows $300 for each 100,000 silk cocoons, and under it Mr. Haynie was allowed $1,350, the largest sum any one person was entitled to. About $8,000 in all were awarded as premiums. No application for mulberry trees was filed.

In the first department (stock), J. D. Patterson received the medal. Second department (machinery), Pacific Iron Works, San Francisco. Third department (mill goods and textile fabrics), Mission Woolen Mills, San Francisco. Special premium to the Pacific Tannery and Boot and Shoe Company. Fourth department (mechanical products), California Powder Works, of Santa Cruz. Special medal recommended to N. P. Cole & Co., of San Francisco, for furniture. Fifth department (agricultural products), I. Landsberger, of San Francisco, for California champagne. Sixth department (fruits), B. N. Bughey, of Folsom, for raisins. Seventh department (fine arts), P. J. Devine, of San Francisco, for marble bust.

FROM GRASS VALLEY.—Our agent, W. H. M., writes:—I went down into Capt. Lee's mine, the Ophir, at Grass Valley, today. He took me all through it. They are down 800 feet, and their new engine is going, having already pumped out all the water. When it was put in there were 200 feet of water in the shaft. It is an 18-horse power engine, and a very fine one indeed. They have struck rich rock since the beginning of the week, a piece of which Capt. Lee gave me to put in a ring. * * The contract for putting in the 10-stamp mill at the Coe mine has been let to W. W. Boston. * * All the gentlemen around here ask me about Mr. Ewer, and when he will return from the East.—[About the first of January.—ED.]

The Earthquake Commission.

From the initial steps taken by the joint Committee of the Chamber of Commerce, of the Academy of Sciences, etc., on earthquake topics, no less than from the character of the men whose names appear in connection with the work to be undertaken, the impression has gone abroad, with due ground to inspire confidence as to its correctness, that something is to be done which will result: firstly, in a collation, and consequent general dissemination of some correct knowledge touching the observed facts and laws concerning earthquakes, so far as the same may have been collected by observers in that specialty in this and other countries; and secondly, in developing and recommending such a practical system of alterations in the construction of buildings as is required by the exigencies of a practical and inventive race, which has suddenly come to a realization of the truth that the "path of empire" has brought it into an uncomfortable proximity with, and a necessity to deal with the subterranean affairs pertaining to the god Pluto. The American character is notorious for its talent of prompt adaptation to circumstances; and were it necessary, or should gray-eyed destiny in the shape of anything transformable into dollars invite, there is scarcely a doubt but that practical means would be speedily devised for living comfortably, and safely, even in a land of perpetual trembling and quaking, though it were in Hades; provided only that the transition were not too disagreeably sudden, for the Yankee does not attempt to adapt himself to anything that he does not understand. Let it be a land of rivers or of lakes of fire,—and the American will sit and watch the phenomena of their burning flow, as Titus Coan, the missionary at Hilo did, on an island between the divided branches of the infernal stream; or he will venture into the pit where the rocks themselves are molten, and the skin is blistered wherever the clothing touches it, as Dana and some of his party did at Kilauea, for the purpose of studying the mysteries of the earth's interior and getting an insight into the conditions of her physiology in her very bowels.

That this committee will be able, if they follow up an enlightened plan, to tell us something worth knowing concerning earthquakes and earthquake proof building, we may safely conclude. But the names will furnish the reader with the best means of judging for himself as to what they may be expected to accomplish. They are as follows:

Citizens—James Otis, President Chamber of Commerce; George Gordon, Louis Saehs, R. B. Swain; James Lluforth, Secretary of Committee, *pro tem.*

On Scientific Inquiry—Dr. James Blake, William H. Rhodes (Caxton), Prof. Thomas Rowlandson, F.G.S.

Civil Engineers—A. W. Von Schmidt, civil engineer of Dry Dock, Hunter's Point; Calvin Brown, C. E.

Architects—William Patton, John P. Gaynor.

Mechanical Engineer—Joseph Moore, Vice President Risdon Iron Works.

Military Engineers—General Alexander, President of the Board of Military Engineers on the Pacific Coast; Colonel Mendell, in charge of construction of fortifications; Colonel Williamson, engineer of light-houses and harbor improvements; Major Elliot, in charge of construction of fortifications.

Legal—John T. Doyle.

Sub-Committees were appointed: 1st, on bricks, stone and timber; 2d, on limes, cements and metallic or other bands and braces; 3d, on structural designs; 4th, scientific and the collection of facts; 5th, legal, the law governing building; and a well devised programme of investigation has been mapped out for each subdivision.

The Commission was organized by electing George Gordon as President, and Prof. Thomas Rowlandson and Michael Bridges as joint Secretaries—the last two being allowed a compensation of $500 each, for a service that will last perhaps four months. It is estimated that about $20,000 will be needed to prepare the material for the report which is to be made, and a committee has been appointed to obtain that amount by subscription.

Ore Deposits and Metallurgy at White Pine.

The following is from a private letter written by a competent and well informed mining engineer of Austin:

"You ask me whether I have caught the "White Pine" fever. I can't say that I have, although almost everybody in Austin has caught it more or less. But then there is much to be said in palliation of the poor fellows who have it bad, especially when one sees the wonderful "piles' of silver, which are being shipped upon so short notice, out of the wilderness. Very reasonable estimates give one million and a half to two millions as the probable yield for the next summer.

The ore occurs as the PRESS correctly stated, in bodies of irregular extent in limestone, or perhaps more correctly in dolomite. On Treasure Hill proper, perhaps ten distinct bodies have been found, several of very great extent (Eberhardt, Keystone, Bluebell, Aurora). But the most peculiar, and as yet entirely undeveloped occurrence, is that upon "Chloride Flat." At the base of Treasure, and between this and the next hill is a shallow ravine, and this is called "Chloride Flat." Sink any where upon it, and after going through from 15 to 20 feet of limestone you will strike a layer of "calespar" from one-half inch to one foot thick, and beneath it what appears to be a layer of ore, often of immense richness. This peculiar position of the ore affords a wonderful facility for its extraction, and Stetefeldt, who has visited the district several times, says that it is possible to "ahban" (to mine out) the whole in two years, with a production of silver as yet not to be estimated. The ore is a pure chloride *i. e.* horn silver, mixed with quartz. But the Ag Cl does not appear as a molten or crystallized solid mass, (which would not amalgamate easily), but as a porous black or brown substance, amalgamating, from this peculiarity, most readily. In crushing there seems always to remain a certain portion of this Ag Cl, inclosed in quartz, which protects it and creates a loss in amalgamation, varying from 20 to 5 per cent., according to the ore. From this explanation you will perceive that it is very natural that $1,000 to $2,000 rock works easily within 95 per cent. of fire assay, while the poorest, say $60 to $100 rock, only works up to 80 per cent. It would be changed by the use of finer screens. It has been tried to roast the ore, but with very poor success, since, instead of producing easily 90 per cent. after roasting, only 75 per cent. were produced, the roasting having melted or "sintered" the horn silver, and as everybody knows, in such a state, it is not likely to amalgamate."

In the *Mining Magazine*, published some years ago by Prof. Wm. P. Blake, there will be found an interesting account of the occurrence of immense chloride deposits at Chañarcillo, Chili, written by E. B. Dorsey, M. E., former superintendent of the Mexican mine at Virginia City, and who was previously connected with the Chañarcillo mine. Mr. Dorsey has shown us his original drawing, representing a section of that mine, which was a true fissure vein in limestone, containing sulphurets in the depths, and chlorides near the surface, with lateral horizontal infiltrations and stockwerks between the strata of the limestone, precisely as at White Pine. We deem this account of such interest in connection with White Pine, as to warrant its reproduction in our next issue.

A very full and interesting account of what may be seen and learned on a visit to White Pine, written by Albert S. Evans, was published in the *Alta* of Nov. 26th, which contains the most complete and reliable, as well as the best written presentation of facts hitherto published, from the notes of a visitor to the spot. He says:

It is a singular fact that while Treasure Hill, which dips westward, is full of deposits of silver of incredible richness, the corresponding hills on the eastward do not contain, so far as is yet known, a single pound of metal of any kind. On the western slope of Treasure Hill, immediately adjoining the town of that name, is Chloride Flat, where hundreds of shafts have been sunk through the limestone to a depth of ten to thirty feet, and deposits of horn silver and chlorides of great value are found to underlie the whole ground, few shafts missing the precious metal entirely. The silver is found along this crest of the hill in vast irregular deposits, in the form of chlorides, bromides, sulphides and ruby and horn silver, not a trace of the ordinary sulphurets being found, and no base metal to interfere with the immediate working of the silver making its appearance. In some places the silver takes the form of "stephanite" and "stetefeldtite," the latter being peculiar to the mines of Eastern Nevada. No gold is found, and the ore is wonderfully tractable. The formation of this part of the district is unlike that of any other yet known on the continent, but we were told by parties who professed to know that the mineral deposits are similar in character, though far exceeding in extent and riches, those of the famous German mines of the Hartz Mountains, and those of Potosi, in Peru, which have been worked for centuries and are not yet exhausted. We should here mention that the ore at this point is mixed with black and white calcareous spar, red quartzite and quartz, but no defined quartz ledges, or fissure veins, like that of the Comstock, have been discovered thus far. What may be found deeper in the hill remains to be seen. * * The ground abounds with detached fragments of lime rock, filled with marine fossils, among which the ammonite, spirifer, corals and seaweed are most abundant. In some places there is a layer of coarse calcareous slate, like red earthen tiles, under the top dirt, and the deposits of silver lie between this and the limestone, while in others the limestone both overlies and underlies the silver deposits, and in places there appears to have been an unheaval or cross action, which has displaced both and jumbled together the country rock and metalliferous deposits in apparently inextricable confusion, making it impossible to judge at this stage of development whether the deposits run in a horizontal or perpendicular direction. * * * Descending the hill towards the westward, occasional deposits of rich ore are found cropping out, but not in large quantities as yet. Crossing the cañon which divides Treasure Hill from the Base Range, and passing over to the cañon between the Base Range and White Pine Mountain proper, a line of deposits of silver, and other metals in combination, is found extending north and south on both sides of the ravine for two or three miles. These are situated at a depth of from 1,000 to 2,000 feet below the Treasure Hill deposits, and though the mines have been but recently located, and are as yet little prospected, the indications of richness and permanency are very flattering indeed. There is a great variety of ores here, some of which are doubtless very refractory, and only to be reduced by smelting. There is copper-silver glance, argentiferous galena, carbonate of lead and silver, antimonial silver, and numerous other combinations more or less well defined. The country rock here is limestone, as on Treasure Hill, and the deposits, though extensive, appear to lie horizontally or more nearly so than perpendicularly.

THE GOLD COUNTRY IN SOUTH AFRICA. British colonial newspapers from South Africa contain ample details concerning the geography and gold deposits of districts in the interior of that country having new and unheard-of names, which will get into the the atlases in time to become familiarized by the next generation of school children. At about 29° E. longitude, the 20th parallel S. latitude is crossed by a range of hills running from northeast to southwest. This range is called the Matoppo Hills. From the southeastern face of this range several rivers flow downwards to the great river Limpopo. The chief of these tributaries is the Shashe, which in its turn is fed by many streams. One of its feeders is the Tati, and another is the Ramaquahan. It is apparently in the wedge of land between these two minor rivers that the fields of glistening quartz, veined with gold are to be found. Thus, speaking generally, the site of the diggings is contained within a triangular area, whose base is about forty miles, and whose sides are respectively eighty and ninety miles; and we may place the gold fields within the 29th and 30th meridians, and the 20th and 21st parallels. It is not improbable that this is part of the field which supplied the ancient city of Ophir of King Solomon's times, rediscovered. Diamonds are also found in South Africa, on the farms and in river-beds.

SILICATED TIMBER.—It is stated that timber rendered fire-proof by saturation with silicates is extensively used in Germany for flooring planks, doors, and staircases.

SHIP-BUILDING PROFITABLE.—Numerous safe harbors and land-locked bays on our coast afford the best facilities for ship-building. Our extensive pine forests yield abundantly pitch, tar, turpentine and rosin. Hemp and flax thrive on our soil. We possess all the raw materials in abundance, says the *Commercial Herald*, and all who have embarked in ship-building have succeeded and become independent. A ship of a thousand tons can be built and put afloat for $60,000; a single freight of wheat at £3 would yield $15,000, or one-quarter the whole cost of construction. But a ship registering one thousand tons will carry thirteen hundred tons of cargo, which, at the same rate, would give a freight return of $19,800.

AMERICAN POLICY WITH THE DARIEN CANAL.—In reply to a speech of General Acosta, Minister to the United States from Colombia, President Johnson declared that it was the policy of the United States not to interfere with or covet the absorption, conquest, or protectorate of any of the Spanish American republics, but, on the contrary, we wished them to remain free and independent. Speaking of the inadequacy of the railroad across the Isthmus for the wants of commerce, Mr. Johnson said that, if encouraged to do so, citizens of the United States would within two years construct and complete the long desired ship canal across the Isthmus of Darien, a work which would permanently raise the Colombian republic to a high rank among nations.

SEMAPHORE STEERING APPARATUS.—Mr. George Read, an officer in the English Coast Guard service, has invented an apparatus by means of which the direction which a vessel intends to steer is distinctly and unerringly indicated to any other vessel which may be approaching, and all possibility of collision thereby avoided. The differently colored port and starboard lights are so arranged as to be concealed except when raised into view by the turn of the wheel, such turn, to the right or left, as the case may be, exhibits the corresponding light. Several officers of the Royal Navy have expressed themselves in terms of warm commendation in regard to the invention.

STEAMER MANAGEMENT.—Mr. W. H. Webb, late owner of the opposition line of steamers, bought heavily in the stock of the Panama line while it was depreciated, and has now been elected one of the directors of that line.

REMOVAL.—Mr. John Roach, one of the very best and longest established opticians of this city, has removed his office to No. 640 Washington street, as will be seen by his card in another column.

A NOTICEABLE FACT.—That one way of appealing to a man's reason is through his eye. In these busy times men are so deeply immersed in the conduct of magnificent projects that they forget all about the condition of their systems, and hence it is that the proprietors of the PLANTATION BITTERS, which cures Dyspepsia, purifies the Blood, improves the tone of the Stomach, regulates the Bowels, and, indeed, invigorates the whole inner man, are so active in advertising. In fact, advertisements are mere sky-rockets sent up to attract attention to a really good article. *

NOTICE.—Persons interested in locating Mineral Lands in California or Nevada, will do well to observe the advertisement of N. Wescoatt, S. & M. E., in another column.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

DEWEY & CO.,
American and Foreign Patent Agents,
Publishers and Proprietors of the MINING AND SCIENTIFIC PRESS, the only well established successful Patent Agents on the Pacific Coast, will give Inventors and Patentees honest and reliable advice, free. The Patent Business in all its legitimate branches is transacted by us intelligently and skillfully, in an able and straightforward manner. Patents secured in EVERY COUNTRY IN THE WORLD where Patent Laws exist. Being long established, and transacting a large business, our appointments are now thorough throughout, safe, prompt and responsible. Consultations by letter or otherwise, are kept inviolately secret. Circulars containing INFORMATION FOR INVENTORS sent free. Valuable inventions, patented through our agency, will be illustrated or explained through the columns of the *Mining and Scientific Press*, a journal most widely circulated throughout the Pacific Coast, among mechanics, miners, manufacturers, and commercial men.
Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.
DEWEY & CO.,
Patent Agents, Publishers and Printers, **414** Clay street below Sansome, San Francisco.
A. T. DEWEY. W. B. EWER.

EVERY miner in the community should subscribe for the Mining and Scientific Press.—*Grass Valley Union.*

THE *Mining and Scientific Press* is one of the best papers of the kind ever published, and to California miners, especially, it has become an almost indispensable requisite for the successful prosecution of their calling.—*Nevada Gazette.*

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

OUNBAR'S IMPROVEO

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANOALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLO OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tl

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Oomestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first-class work, and we intend to do no other.

EARTHQUAKE INDICATOR.—The following suggestion from J. D. Cooper, M. D., to the *Evening Bulletin*, appears to have merit. He says:—"Since the Japanese magoet indicator has proved a failure, we are now obliged to look for some other means of prognosticating these fearful convulsioos, and I wish to suggest the following mode by which we may make electricity the means, perhaps, of saviog thousands of lives in case of the occurrence of more severe shocks than we have yet experienced. It is well known that these shocks are produced by a wave-motion of the surface of the earth, the waves radiating from a center just as they do in water when a stone is thrown in. If this center happens to be far enough from the city, we may be easily notified of the coming wave in time for all to escape from dangerous buildings before it reaches us. The rate of velocity, as observed and recorded in Dr. J. B. Trask's work on *Earthquakes in California from* 1800 *to* 1864, is 6 1-5 (six and one-fifth) miles per minute, or a little less per hour (40 miles) than the tidal wave is reported to have traveled across the ocean to this port from the Sandwich Islands or Japan.

A very simple mechanical contrivance can be arranged at various points from 10 to 100 miles from San Francisco, by which a wave of the earth high enough to do damage, will start an electric current over the wires now radiating from this city, and almost instantaneously ringing an alarm bell, which should be hung in a high tower near the center of the city. This bell should be very large, of peculiar sound, and known to everybody as the *earthquake bell*. Of course nothing but the distant undulations of the surface of the earth should ring it. This machinery would be self-acting, and not dependent on the telegraph operators, who might not always retain presence of mind enough to telegraph at the moment, or might sound the alarm too often. As some shocks appear to come from the west, a cable might be laid to the Farralone Islands, 25 miles distant, and warnings thus given of any danger from that direction.

Of course there might be shocks the central force of which was too near this city to be thus predicted, but it is not likely to occur once in a hundred times.

COÖPERATION OF WORKINGMEN. — The *Colliery Guardian* reports the proceedings of the International Workingmen's Congress, held at Brussels, in September last. At one of the sittings, the effect of machinery upon manual labor was discussed. Papers were read upon the wage-reducing effect resulting from the displacemeot of manual labor, and substituting women's and children's labor for that of men. It was urged that a complete transformation of society had occurred, an unprecedented progress in production made, which had resulted in a sweeping competition, which was always detrimental to the working classes; and that this would continue as long as machinery remained the monopoly of the capitalists. The commission appointed to report upon the question proposed the following:

"Considering that the introduction of machinery in the process of manufactures has always been a means of using the laborer for the profit of the capitalist; considering that the machine will not render a real service to the workingmen until it is in their hands, we conclude that it is only in the coöperative association that the producers can arrive at any practical result, and that the obstacles which to-day prevent workingmen from deriving any benefit from the machine can be removed."

ELECTRIC PERPETUAL MOTION. — The *Monitor* of San Luis Potosi, Mexico, describes an electric perpetual motion, invented by Francisco Estrada, Sr. Electricity starts the motion, and the latter produces electricity, causing continual motion, only to cease with the destruction of the apparatus. The *Monitor* thinks that Estrada was the first to combine both of these elements so that they mutually reproduce each other. Besides, says the *Monitor*, Mr. Estrada's machine impulsively moves as soon as the last piece of the machinery is affixed, and continues afterwards without cessation. Estrada claims to demonstrate that electricity, magnetism, light, motion and heat, are one and the same element.

SEAMEN BECOME LANDSMEN.—It is estimated that since the war four millions of American seamen have been weaned from the ocean and have devoted themselves to other pursuits. These men have become producers instead of consumers, and the money formerly paid to them for maritime service now goes to maintain the naval supremacy of other countries.

EATING CLOUDS.—Dr. Livingstone, relating his adventures on Lake Nyassa, thus tells of one curiosity which he fell in with:

"During a portion of the year the northern dwellers on the lake have a harvest which furnishes a singular kind of food. As we approached our limit in that direction, clouds, as of smoke rising from miles of burning grass, were observed bending in a southerly direction, and we thought that the unseen land on the opposite side was closing in, and that we were near the end of the lake. But next morning we sailed through one of the clouds in our ride, and discovered that it was neither smoke nor haze, but countless millions of minute midges, called "Kungo" (a cloud of fog). They filled the air to an immense hight, and swarmed upon the water, too light to sink in it. Eyes and mouth had to be kept closed while passing through the living clouds; they struck upon the face like fine drifting snow. Thousand lay in the boat when she emerged from the clouds of midges. The people gathered these minute insects by night and boiled them into thick cakes, to be used as a relish—millions of midges in a cake."

OPPORTUNITY FOR INVENTION.—In view of the establishment of new markets in London for the rapid transit and distribution of food as supplies in the metropolis, the Society of Arts offer as prizes for the best improved models of railway meat vans, milk vans, and milk cans, the Society's silver medal and £10 for the best plan of each. In the first case, the object in view is to reduce to a minimum the deterioration which meat now suffers in its transit by rail. The principal evils to be avoided are—excessive changes of temperature, and injuries by pressure, by handling, exposure to dust, insects, etc. The other competitions are intended to produce plans for obviating the injury done to milk on its transit by the shaking and the heat.

THE CHEYENNE AND DENVER BRANCH R. R.—Work is being done on the Cheyenne and Denver Branch of the Union Pacific Railroad. The latter road can hardly supply itself with iron at the present time, and can spare no cars to bring iron to the Denver road; but it was thought that the grading of the whole fifty miles would be finished about the first week in November, so that travelers to the Colorado mines will be able to make the trip to Denver in the cars by Christmas.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR. G. W. COOL. the right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v16-3m

BUERK'S
Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canadas about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this a Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Seventy-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

☞ This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.
P. O. Box, No. 1057. 23v16-6m

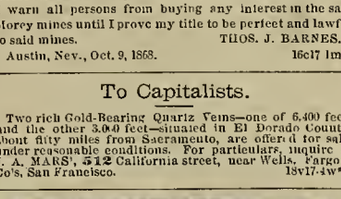
OIL STOVES!
MORRILL'S
Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of $100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by
M. B. BULLARD,
Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.



N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16-3m

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR NOVEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

Nov. 6th—CONSTITUTION.....Captain W. H. Hudson. Connecting with ALASKA, Capt. Gray.

November 14th—GOLDEN AGE.....Capt. W. F. Lapidge, Connecting with OCEAN QUEEN, Capt. King.

November 21st—COLORADO.....Capt E. S. Farnsworth, Connecting with HENRY CHAUNCEY, Capt. Connor.

November 30th—SACRAMENTO.....Capt. W. H. Parker, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on SATURDAY, October 3d, at 12 o'clock M., from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting with the COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorf streets.

OLIVER ELDRIDGE, Agent.

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is ten weeks. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge*; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases tor an immediate patent, persons can deposit the nmount of tho last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor tn receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of pntent papers to inventors nu this Cnnst, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

What Claims can be Patented?

A knnwledge of Ancient and Modern Mechanics and familinrity with American and Foreign patent issues and rejections, enables us to determine in n measure in all cases what can be pntented, and how much can be claimed as new and novel, and bo covered by Letters Patent. This is one of the most difficult questions oncountered by both old and new inventors—ono in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting n formal application for a patent to the Government, cnbracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Patent Rejections.

First. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly nrranged and stamped. A slight omission often proves fatal.

Second. If the drawings are defective, and are not executed in an artistic manuer in India ink, and on sheets of the required size, they are subject to rejection.

Third. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making nrguments, and personally attending to explnin the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to asscrtnin their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Dangers of Delay.

Situnted so remoto from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast thnn to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signnture of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing officinl fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from $20 to $40.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	19
On every application for a design, for 3 y'rs and 6 mos	15
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Illustrate your Inventions.

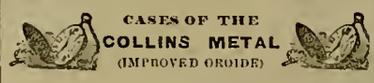
Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the enlumns of the Mining and Scientific Press. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

DEWEY & CO.,



Patent Solicitors, Mining and Scientific Press Office,
414 Clay Street, below Sansome, San Francisco.

September, 1868.

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notice that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full-Jeweled Patent Levers*; those for Ladies an Improved Escapement, better than a lever for a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. Those for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $5. Also, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part of the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well known among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It keeps accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends, and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office State Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E Collins & Co.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid bill on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,982. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. Phipps.

Address,

C. E. COLLINS & CO.,

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Oldest and Best MINING AND MECHANICAL Newspaper Issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 414 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (41½ columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its Seventeenth Volume, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

Resolved, *That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the* Mining and Scientific Press, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk. If parties sending will register their letters, or send money orders.

DEWEY & CO.,

New Mining Advertisements.

Alamo Gold and Silver Mining Company.—Location of the Mine, Lyon County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of November, 1868, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, No 319 California street, (Room No 5 Hayward's Building) San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the thirtieth day of January, 1869, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F POPE, Secretary.

Office, No. 319 California street, (Room No. 5) San Francisco. no28

☞Gold Hill News copy and send bill to this office.

Nevada County Gold Mining Company, Nevada County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of October, A. D. 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Wm B Peake	425 to 450 inc.	26	$26 00
Wm B Peake	261 to 299 inc.	39	39 00
Wm B Peake	300 to 315 inc.		
	341 to 350 inc.	26	26 00
Unknown	141 to 245 inc.	107	107 00
Unknown	257 to 280 inc.	4	4 00
Unknown	356 to 408 inc.	53	53 00
Unknown	471 to 500 inc.	30	30 00
Unknown	91, 93, 410, 452	4	4 00

And in accordance with law, and an order of the Board of Trustees, made on the fifth day of October, A. D. 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 9 Merchants' Exchange, San Francisco, Cal., on Saturday, the twenty-sixth day of December, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. AUG. KNAPP, Secretary.

Office, No. 9 Merchants' Exchange, California street, San Francisco. no28

San Francisco and Castle Dome Mining Company. Location of Works: Castle Dome County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of November, 1868, an assessment of three cents per share was levied upon the capital stock of said Company, payable immediately, at the office of the Treasurer, A. I. Gladding, No. 420 Montgomery street, San Francisco, in United States gold an silver coin.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twelfth day of January, 1869, to pay the delinquent assesment, together with costs of advertising and expenses of sale. Office, No. 226 Clay street, San Francisco. nov14

Machinery.

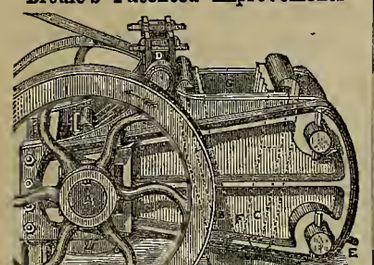
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles. Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere. ☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION
PATENT
Variety Molding and Planing
MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop in cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

DEWEY & Co.,

Mining and Scientific Press Office, San Francisco

The Powell Colorado Exploring Expedition.

A correspondent of the Springfield *Republican*, writing from Middle Park in the Rocky Mountains, a spot which may now be considered almost within the precincts of civilization, speaks thus of this meritorious enterprise for adventure in the cause of science and civilization; the results of which we hope to be able to lay before our readers in due time:

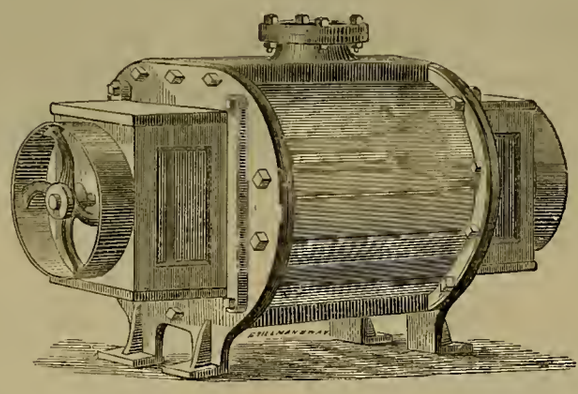
We made familiar acquaintance with Prof. Powell's scientific exploring party, from Illinois, while in the middle Park. They were in camp there for some time, and made it the end of their summer and the beginning of their winter campaign. The party comprises a dozen or more enthusiastic young men, interested in one department or other of natural science, or eager for border experiences, mostly from Illinois, and giving their time and labor to the expedition for the sake of the education and the health. Prof. Powell, the originator and head, does more. The Government furnishes food, allowing it to be drawn from the supplies of the nearest post; and the Illinois University and Natural History Society contribute small sums of money; but he draws upon his private purse for all deficiencies, and these must be many thousands of dollars before he gets through. The summer has been spent among the higher mountains and in the parks, taking careful notes with barometer and thermometer, collecting flowers and birds and larger animals, and studying the rare geological phenomena of the country. Their collection of birds is very full and valuable, and numbers over 200 different specimens. Prof. Powell, two or three assistants, and Mr. Byers, of the Denver *News*, who knows all these mountains better than any other man, probably, have just accomplished the ascent of Long's Peak. This is the prominent northeastern mountain of the Coloradian series, is seen from the railroad, and is 14,000 feet high, and has heretofore defied all the efforts of explorers and mountaineers to reach its top. They had a terribly hard climb of it, but felt amply repaid in the glory of the fact, and more in the glory of the landscape spread before them at the summit. The plains and mountains to the north, beyond the railroad, the unending eastern plains, with Denver and the intervening settlements, the whole of Middle Park, and the surrounding and far-beyond mountains—all Colorado, as it were, and part of Dacotah, lay beneath their eyes. Streams flowed out from the mountain in all directions, and no fewer than thirty-nine lakes on that and the neighboring mountain sides, nearly all of and above the altitude of 10,000 feet, were visible from their commanding hight.

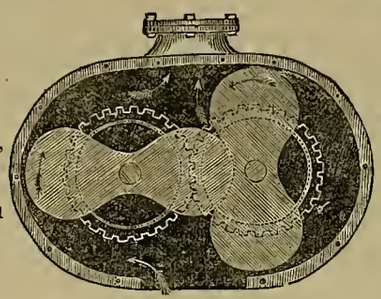
From here the explorers will follow down the Grand River, out of the Park into Western Colorado, and then strike across to the other and larger branch of the Great Colorado River, the Green, and there encamp through the winter. After leaving the Grand they will follow down the White River branch of the Green to its mouth, and probably make that junction their winter quarters. This is in the Territory of Utah. The great and final object of the expedition is to explore the upper Colorado River and solve the mysteries of its 300-mile cañon. They will probably undertake this next season, by boats and rafts from their winter camp on the Green; but they may postpone the adventure still another year, and meantime discover and reveal the mountains and plains of Western Colorado and Eastern Utah, which are so little known.

But the mocking ignorance and fast fascinating reports of course and country of the Colorado ought to hasten them to this interesting field. The maps from Washington, that put down only what is absolutely scientifically known, leave a great blank space here of 300 to 500 miles long and 100 to 200 miles broad. Is any other nation so ignorant of itself? All that we do know goes to show that, beginning with the union of the Grand and Green rivers, the Colorado is confined for 300 miles within perpendicular walls of rock averaging 3,000 feet high, up which no one can climb, down which no one can go, and between which in the river, rapids and falls and furious eddies render passage frightful, certainly dangerous, possibly impossible.

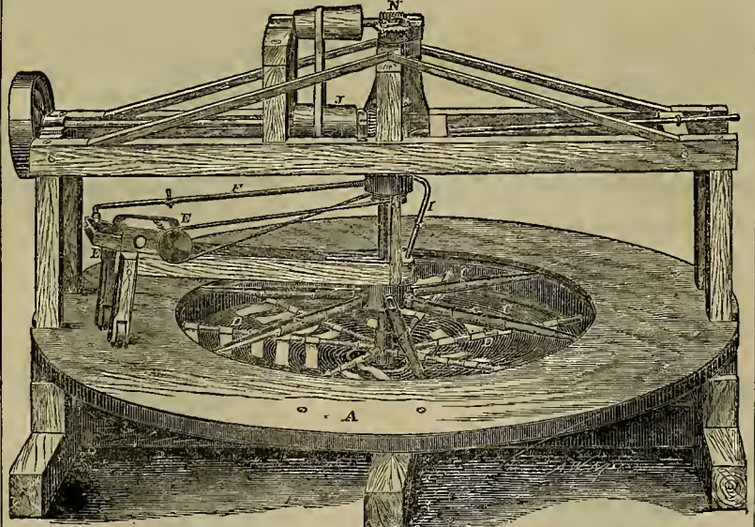
The general conviction of the border population is that whoever dares venture into this cañon will never come out alive. But we have an authentic account this season of a man who made the trip last year and lives to tell the tale. He and a companion, prospecting for gold in southwestern Colorado, and driven by In

dians, took to the Grand River just before its union with the Green, made a raft and committed themselves to the waters. Foaming rapids and a whirlpool swept the companion and all the provisions off, and they were lost, and White, the surviving hero's name, passed seven days more, a second seven days, without food upon these strange waters, between frowning walls, over dangerous rapids, through delaying eddies, before he reached Callville in Arizona, the first settlement and the head of navigation on the river. His entire journey upon the river must have exceeded 500 miles, and he represents that for most of the distance it was through these traditional high walls, impassable as a fortress, a dungeon over a cataract. Nearly all the rivers of Colorado and Utah run for brief distances, from one to twenty-five miles, through these gorges of rock, or they "cañon"—as, by making a verb out of the Spanish noun, the people of the country describe the streams as performing the feat of such rocky passages, where their banks are unapproachable, and trails or roads are sent over or around; but this rock-guarded career of the great river of the interior basin of the continent is the grand cañon of the world, and one of its most wonderful marvels. Its passage in well protected boats by careful navigators can scarcely be deemed impracticable, however dangerous, and the country will await the Powell movement through it with greater interest.





The whole field of observation and inquiry which Prof. Powell has undertaken is more interesting and important than any which lies before our men of science. The wonder is they have neglected it so long. Here are seen the central forces that formed the continent; here more striking studies in physical geography, geology and natural history than are proffered anywhere else. New knowledge and wide honors await those who catalogue and define them. I can but think the inquiry, vast and important as it is, is fortunate in its inquirers. Prof. Powell is well educated, an enthusiast, resolute, a gallant leader, as his other title of Major and an absent arm, won and lost in the war, testify, seemingly well endowed physically and mentally for the arduous work of both body and brains that he has undertaken. He is every way the soul, as he is the purse of the expedition; he leads the way in all danger and difficulty, and his wife, a true helpmeet, and the only woman with the party, is the first to follow.



THE CRAWLING AND HOPPING NUT.—Specimens of this curious vegetable production have recently been brought from Sonora, Mexico. It is called by some the *Siempre Viva*, or "ever living," but that name is likewise given to a plant which will open up when put into water, after having been for years in a dried condition. The editor of the Virginia *Enterprise* describes it thus:

The nut is of a triangular shape, and its bulk is that of a small hazel nut; it is one of three similar nuts found in the same husk, which doubtless accounts for its peculiar shape. The singularity of the nut, however, is not in its shape, but in its actions. It behaves exactly as though alive. When placed in the palm of the hand, upon a desk or in a plate—in fact, in any place so that it is not confined - it begins crawling and hopping about. All its movements are a series of jerks of greater or less force, which appear to be owing to a sort of throbbing of the whole nut, and these throbs can often be felt in the palm of the hand when they are not strong enough to move the thing itself. When it has been kept confined for a few days it appears to become somewhat torpid, and when exhibited will not begin its comical hoppings for some minutes. The more it is exercised the more lively it becomes.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.
One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Æ tna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.
For circulars and further information, address
KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.
One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.
It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.
The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.
One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.
For further information, apply to THOMAS N. PAINE, Grass Valley, California.
PAINE, STEPHENS & HARRY.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.
THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Placer and Quartz Mining at Dutch Flat.

Letters like the following are useful to the mining community, far and near, and the MINING AND SCIENTIFIC PRESS will serve as a constant means of taking back to every writer more information of the kind than he can furnish himself, and such as he could not obtain in any other way than by a system of literary exchange :

DUTCH FLAT, Nov. 16th, 1868.

TO THE EDITOR OF THE MINING AND SCIENTIFIC PRESS :—I am requested to write to you concerning matters of interest connected with the mines of this section. Mining at this place is, at present, nearly stopped ; partly from the want of water in hydraulic claims, which will prevent its being resumed until the wet season is fairly set in. There are, however, satisfactory evidences developed here of the existence of an extensive "Blue Lead," running under the center of the divide, which has been prospected in different places, at one of which, known as the Baker Boy's claims, they are busily engaged in the erection of a good cement mill, that will be in running order in a few days. The want of capital and enterprising men is the drawback here, as there is plenty of good ground.

Regarding quartz, there is a lode known as the "Champion," about twelve miles above this place, which, if located in some other districts, would be considered of immense value. It is from eight to ten feet wide, on an average, shows considerable free gold the entire width, and may be traced for miles. On the "Champion" Co's claims they have an open cut of sixty-five feet and a tunnel thirty feet farther, showing great improvement. The rock has paid $45 per ton of free gold in a prospecting mill. The sulphurets are good. About one-fifth of the gross weight of the ore is sulphurets, that assay $225 to the ton.

Our town looks dull at present, but we expect better times than we have ever had if this mill of the Baker Boy's succeeds.

There are a number of drift claims about here, among which is the "Buckeye," that pay well. Between this place and Gold Run the mines are running night and day, a number of which are paying largely. In my next I will particularize.

Yours, etc., A. E. R.

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

AGENTS WANTED FOR
SUNSHINE AND SHADOW IN NEW YORK
Matthew Hale Smith's New Book.

This is the most popular work ever introduced on the Pacific Coast. It outsells every other publication.

Agents report from 6 to 150 subscribers per week. If you wish to know how fortunes are made and lost in a day; how shrewd men are ruined in Wall street; how countrymen are swindled by sharpers; how ministers and merchants are black-mailed; how gambling houses and lotteries are conducted, read SUNSHINE AND SHADOW IN NEW YORK, and learn about New York bankers, merchants, brokers, editors, police, military, detectives, gift swindlers, pickpockets, etc., with biographical sketches of all the prominent men in the great metropolis.

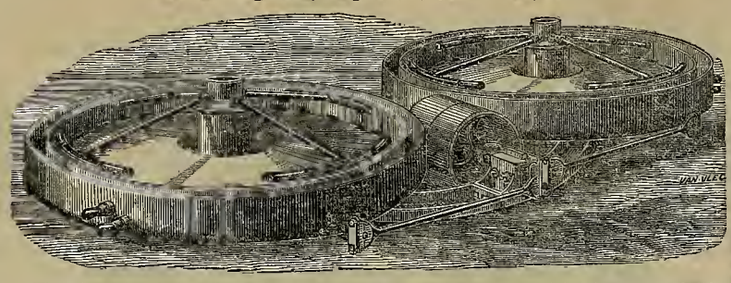
Agents desiring territory for this rapidly selling book should apply immediately to R. J. TRUMBULL & CO.,
20v11p1m 425 Montgomery street, Room No. 5.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1855, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.



Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y15p

HUNGERFORD'S IMPROVED CONCENTRATOR,
For Saving Gold, Sulphurets, Quicksilver, etc.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned ; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORN—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868.

MR. MORGAN HUNGERFORN—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lamhard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

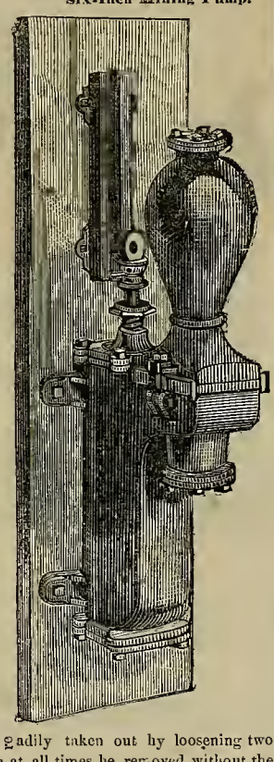
BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—Dear Sir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODNARN & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.



These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,
GODDARD & CO., San Francisco.
Or M. HUNGERFORD, at the Pacific Iron Works.

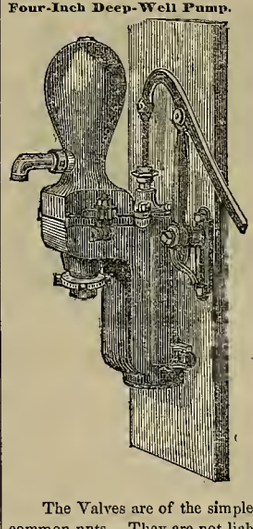
HANSBROW'S CHALLENGE
Deep-Well, Mining and Double-Cylinder Patent Pumps.



Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents, LOCKE & MONTAGUE,
☞Send for a descriptive Circular. 112 and 114 Battery Street, San Francisco.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government licenses and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

MINING AND SCIENTIFIC PRESS.

Subscription, $5 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 5, 1868.

VOLUME XVII. Number 23.

Table of Contents.

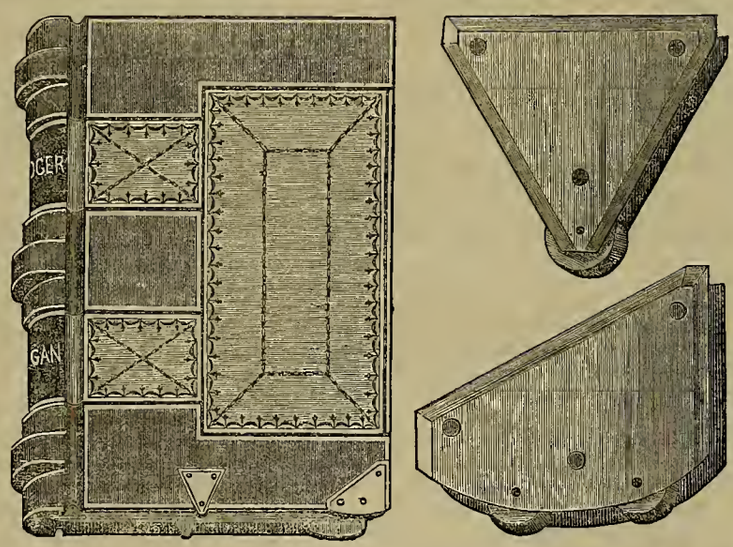
Anti Friction Book Roller—Illustrated.
Wintering at White Pine.
Water Decomposing Furnace
Mining in Plumas County.
Colorado Mining.
Rationale of Perpetual Motion.
Curious Facts in Telegraphy.
Science at Fault.
Grain Farming.
The Smelting Operations at Owens River.
Meteors Striking
A Hundred Fortunes for a Little Knowledge.
The London Underground Railway.
Business at the Patent Office
Valuable Invention for Brick Making.
Noted Horn Silver Deposit in Chili
Dry Earth Sewage.
Setting off Blasts by Electricity.
Practical Instruction in the Natural Sciences.
Earthquake Committee.
The Ice Trade.
Ruthenium.
Railroad Train Destroyed by Nitro Glycerine.
Zincographic Map of San Joaquin Valley.
MECHANICAL MISCELLANY.—Cast and Wrought Iron for Buildings; Solar Heat as a Source of Power; Carbon in cast iron; Rock-channeling Machine; Oil Painting on Zinc; Steel from Poor Ores.
SCIENTIFIC MISCELLANY.—The Eclipse; The Source of Light in Flame; Oxygen from Atmospheric Air.
ENGINEERING MISCELLANY.—Proceedings of the N. Y. Society of Practical Engineering; France and the Darien Canal; Humboldt and the Colorado Railroad.
MINING SUMMARY—Comprising late intelligence from the various counties and districts in California, Arizona, Colorado, Montana, Nevada, New Mexico
San Francisco Mining Shareholders' Directory.
San Francisco Metal Market
San Francisco Market Rates.
Notices to Correspondents.
Stock Prices—Bid and Asked.
New Incorporations.

Fortunes for a Little Knowledge.

Such is the prize now offered, on this coast, for a trifling little idea, trick, device, or notion, whereby our petroleum, such as it is, may be made available for ligbting purposes, or for fuel. There is enough of it; flowing out of itself, by scores of barrels a day, in Santa Barbara County and elsewhere along the coast. But the petroleum dealers inform us that the article is a drug, for the simple reason that it will not burn as brightly, and cannot be refined as cheaply, as the imported price of the Eastern article; and the use of petroleum for fuel has, for some reason or other, not been perfected. At any rate there is no demand for our heavy petroleum, and the tunneling and boring stocks are below par.

It is a simple problem; but the simplest problems are the most difficult to solve until we hit upon the happy idea. "Wet the ropes," said the old sea captain at Rome, when the columu that was to rise would not rise any farther.

We will call the reader's attention, merely to the difference between our oils and the Eastern. Dealers say they are "heavy," *i. e.*, when Baumé's hydrometer, (containing shot in a glass bulb), as put into a body of California petroluem, it does not sink so deeply—the fluid bears it up. The specific gravity of water being 10°, that of crude California petroleum is 18° to 30°, and that of the Eastern 40° to 50°; refined (distilled) California petroleum is 40°, and Eastern 43°. Crude California petroleum yields 45 to 50, while the Eastern yields 75 to 90 per cent. of refined. Here the petroleum comes out in asphaltum springs; there is a baser substance to it; it smokes more easily when burned in an ordinary petroleum lamp. But in its heating capacity the California petroleum has been pronounced superior to the Eastern, notwithstanding which the Foot's Burner Company, which commenced operations at the Ætna Works, does not appear to have been able to create any demand for petroleum.



The only use that the Santa Barbara petroleum is now being put to is brick burning, and to make gas, experimentally. Mr. Stott has sent some to Virginia City for that purpose, and Mr. Stanford also furnished some to a gas company of this city; with what results, economically, we are not able as yet to report.

Anti-Friction Book-Rollers.

As it is the cover which first succumbs to time and usage, in heavy books required for frequent reference, Mr. G. G. W. Morgan, of this city, has invented the following very simple appliance, to be bound into the cover, for which a patent has been demanded through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

These book-cover rollers can be applied before the book is bound and covered with leather, or afterwards, and left exposed—with plain rivets, or with headed rivets, as may suit the taste of the purchaser, and as shown in the accompanying illustrations.

This invention, it is thought, will commend itself to general use, especially where

heavy books are required, as in the offices of the superintendent of streets, county clerks, registers, collectors, assessors, etc. The large engraving represents a book with rollers exposed and in position for use, and the small cuts front and rear rollers.

If we were able to show a full statement of the amount of money paid out annually in the United States for re-binding heavy account and record books, it would doubtless surprise, even those of our readers who are most familiar with the blank-book and stationery trade.

Persons wishing further information concerning this invention, can address the inventor, No. 742 Harrison street, San Francisco.

OVERLAND MONTHLY.—The December number of the *Overland* is out. Everybody that appreciates good literary matter buys it on sight, the price being only three bits, and the articles "timely" to a creditable degree. Four or five articles are invariably met with that furnish acceptable mental food, and the ideas are native to the Pacific slope. Nothing could be more appropriate than to send it to friends in the Atlantic States. The editor, it would seem, has a horror of trashy stories, as few or none run the gauntlet of his approval.

CHILIAN INDUSTRIAL EXHIBITION NEXT APRIL.—This is intended to be an agricultural and industrial exposition of all the North and South American States. An opportunity will be afforded to those who have leisure, or interest in that direction, for note-taking and comparisons concerning the advancement of civilization on the western slope; and we shall for the first time realize how the several Pacific States, from north to south, are bound together by a chain of interest, as well as by a chain of mountains. We have always fraternized agreeably with these westward-looking States,—through our traders, whalers, our mining engineers, gas manufacturers, railroad and telegraph engineers, etc. We are to begin making national acquaintanceship; and our common bearings toward the East and the West, historically as well as industrially, are to be scanned. Not a few live Californians are to be found on the western slope, who will undoubtedly have their dinners, and make their speeches, at Valparaiso. Covarrubios, the President of the Chilian Exposition, informs and requests consuls and the press, as follows:

First.—To make known to manufacturers and mechanics who may propose to take part in the Exposition, that it will open April 1st, next, without fail, and that shipments must be made to Valparaiso without delay, in order to reach there in due time.

Second.—All exhibitors must address their respective Consuls residing in Chili or the President of the National Committee of Chili, via Panama, mentioning the nature of the effects to be forwarded, and, as much as possible, their number and classification and the ground space deemed necessary for exhibition. The last mentioned specification must be made by the next mail after this communication is received, or at furthest by the mail thereafter, in order to make the distribution of space of the Exposition.

Third.—By virtue of a supreme decree, which doubtless has reached you, it has been resolved to pay every person coming to this country from Europe or the United States, the sum of $40, as an aid towards their expenses. Therefore, all workmen sent by manufacturers to manage their apparatus, shall enjoy this same aid,—and owners will be allowed reductions in freight and free importation, and other advantages especially granted with a view to the success of this measure by the Government of this Republic.

Regarding the prospects of this exhibition, the *Bulletin* says:

Californian exhibitors are certain to be received with peculiar friendship, for although some of the citizens of Chili who came here in early times, were not well treated, there are thousands of Chileans who have pleasant recollections of the State, while the recent acts of kindness and the close political sympathy between the two countries would furnish additional reasons for a generous hospitality.

ZINCOGRAPHIC MAP OF SAN JOAQUIN VALLEY.—We acknowledge the receipt from Webster Brothers, an enterprising agricultural implement firm at Stockton, of a circular containing a map of the "great San Joaquin Valley"—their especial field—with engravings of their place of business, and of nine different kinds of gang-plows: the Excelsior, the Dry Adobe, the Adobe King, the Cultivator, the Samson, the Standard, the Nonpareil, and the Eureka, together with a common plow, called the "Clipper." The sheet is copyrighted by O. M. Clayes, of the Stockton *Independent*.

Concerning the map, it is of considerable interest from the fact that it was not engraved, but "zincographed," by a new French process whereby the drawing is made on zinc, with an insoluble ink, and the zinc not covered is then eaten away with acids. Mr. Van de Casteele is the expert in this business in Britton & Rey's lithographic establishment, in this city, where the map was published. While it is evident that an immense saving could be effected by the use of the zincographic process in connection with type, it appears, from the best specimens we have seen,—amongst which this map may be considered,—that the zincographic process is not yet quite a success in San Francisco except for coarse work. Gillot, of Paris, has, however, produced some of the finest specimens of art with it. In time, zincography will become generally known. It will take the place, to a considerable extent, of wood engraving, and will make pictorial illustrations with type as cheap as the type. The impetus that such a discovery may give to the pictorial art, and to the transmission of intelligence by print in newspapers, circulars, etc., can easily be conceived to be of far greater consequence to the world than revolutions, or inventions of a much more imposing character.

TRANSFERRED.—Our esteemed friend Guido Kustel, has transferred his assaying and metallurgical business at No. 611 Commercial street, opposite the Mint, to Leopold Kuh, of Virginia City, who is well known to the miners and millmen with whom he will thus be brought into enlarged connection. The same office was formerly Mr. Molitor's, who has located himself in Montana.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Wintering at White Pine.

Editors Press:—Impelled by the delusive White Pine fever far too many are thoughtlessly rushing thither, at this season of the year, who will encounter such extreme cold and desolation in that elevated region that successful prospecting will be impossible for four or five months hence. I have sojourned and prospected Central and Eastern Nevada, during one summer and two winters, and from my experiences, would warn all from going to White Pine now; at the same time I will endeavor to forearm those who still desire to go in the spring. During the winter of 1866-7, I was employed in the examination of seven mining properties situated in various districts of Humboldt County, Nevada, and although they were all located in the low foot-hills,—and it was considered an unusually mild season,—I had to await the more favorable thawings, during several months, before I could report upon them. The winter of 1867-8 was more severe, and prevented all examinations of the ledges whose positions were known, and rendered prospecting impossible, even in this comparatively well grassed and wooded country. To show this more palpably, I may say that the Humboldt River was frozen over to a depth of from twelve to eighteen inches, and the alkaline flats were covered with snow for nearly two months; the thermometer sunk to from 10° to 17° below the freezing point, nightly, and in the house where I had to hibernate, it was necessary to take my boots abed to keep them supple for morning. I would not be misunderstood as to the climate, for I believe it to be the most healthy in the world; but such low temperature freezes extremities, conceals the ground, and by covering grass and ledges alike, it renders all explorations most unpleasant and unprofitable, even to those who are inured to the life of a savage. White Pine District is at a much greater altitude than this, and being some hundreds of miles farther in the interior, and farther from supplies, it must be very deficient for the accommodation of such an influx of population.

Admitting that these irregular pockets are but one-tenth as numerous and valuable as they are said to be, and that many poor men will become rich thereby, (if not sufficiently extensive for large companies) I would in sober earnestness ask the question of many now talking of going, if they really know the extraordinary hazards and number of blanks that there are for one prize?

Three thousand men are said to be there, who have prospected this region during the summer and autumn, with an enthusiasm eminently suitable for the work, and being practiced in prospecting, they have located all that was *exposed* or *supposed*, good, bad, and indifferent. These veteran prospectors will start forward in the early spring, and knowing what has been already examined, will explore new ground, and continue to locate claims, in advance of the uninitiated and less experienced. The history of mining has shown that great riches lie far apart, and that a good mine has been often the means of scattering more money in its vicinity than has been realized therefrom.

For the above reasons it is very probable that ninety-nine of the hundred who are now going to White Pine, will return poorer than they went, so far as mineral locations will profit them; although they may be benefited from merchandize, or from wages, for work performed for others; so that they must practice the most rigid economy to maintain them longer, and end with the least possible loss, should they be unfortunate. With this in view, you should take a small frying pan, coffee pot, tin cup, knife, fork and spoon, so as to make your bread and cook your food in such various ways as necessity will dictate, from such limited staples as flour, bacon, beans, coffee, pepper and salt. On arriving there, you will do well to follow the instincts of burrowing animals, and select a sandy slope for your camp, wherein you can dig a suitable hole for your sleeping accomodations, in close proximity to sage or grease bush, for making fire to warm your poor feet, etc., while you repeat the prospector's philosophic motto, "What can't be cured, must be endured."

If during your first sleep in this primeval manner, a clamorous coyote, scenting your provisons should dispute your title and jump your claim, by informing him with a bold front and in a *stentorian* voice, that you had worked your assessment according to law, he should, and probably would depart; but failing in this, you may enforce it with your rifle or six-shooter. This manner of living is imperatively necessary for greater economy and proximity to your ever-varying labors; you can thus board yourself a week for what you would have to pay for one day at the inferior restaurants, and by the aid of three thick California blankets and a little brushwood under you, you will be comparatively comfortable. I have seen many fine fellows in such positions in that country, and I would that all such noble hearts should become as exalted as they were thus humbled. In conclusion, I would caution you against wasting your time on the igneous (porous rock) mountains; as I have observed there, as elsewhere, that minerals are found in primitive, transition, and secondary strata, and near their junctions.

In that region, the uplifted clay slate, and lime rock foot-hill patches, have generally produced mineral. A belt of ground lies unexplored before breast of the railway, as it advances toward the Rocky Mountains, that affords greater allurements for an energetic corps of prospectors, than anywhere in that country. This also applies to those who are approaching on their eastern slope, through the secondaries, at the head water declivities of the Atlantic rivers.

J. S. Phillips, M. E.

San Francisco, Nov. 30th, 1868.

[Written for the Mining and Scientific Press.]

The Water-Decomposing Roasting Furnace.

The Hagan Water-Burner, for desulphurizing mineral ores, is about to have another trial at a mine near Angels, Calaveras County.

The patentees are full of confidence that ores, in lumps of battery size, can be completely freed from all base elements, such as sulphur, arsenic and antimony, by their process, and at a cost not exceeding a dollar a ton.

The ordinary roasting does not get the sulphur out, unless the ore is reduced to coarse powder before heat is applied. But it is claimed that the Hagan method does eliminate the sulphur. It is claimed that the water injected upon a small fire, in the form of steam, highly dried by superheating, is decomposed; that the hydrogen set free becomes fuel,—thus saving wood. It is said that all of the hydrogen is not burned; that part of it escapes the flame and combines with the sulphur, going off as sulphureted hydrogen.

As we understand it, this hydrogen is supposed to have the power of penetrating the mass of rock and of reaching and bringing out the sulphur, which ordinary roasting can not do. The oxygen liberated from the water, is supposed to go in part to the wood fire from which air is excluded, and thus the fire is kept up; a part goes to the hydrogen, which would also not burn without it, and a part combines with the iron in the pipes, which, in fact, give proof of it by being rapidly consumed. To lessen this costly destruction, cast iron pipes are being substituted for wrought iron. These iron pipes receive the steam; they are kept at a high heat inside of the kiln, and the steam thus superheated exudes through small perforations, and is caught by the fire and finally decomposed. Hitherto complete decomposition of water has never been effected, except at great and impractical cost. It is a common practice to inject steam upon a fire to enliven the flame, and a small quantity is decomposed, sufficient to produce some slight effect, but it is of little practicable advantage. Sulphur is itself good fuel, and when in great quantity, very little additional fuel is required for ordinary roasting. It is to be hoped that the experiments at Angels will be watched very closely, that the doubts may be removed, which all former trials have left upon the minds of competent investigators. The last experiments at the Enterprise mine, near Cisco, have not entirely satisfied the officers of the company that the process is likely to be of the great benefit to our mining interest, which the patentees confidently predict. Every pains should therefore be taken by the proprietors of the mine to aid in close investigation, and to make public the chemistry of the process, which is not very clear to science, as it is set forth. Miners will not be content with certificates from interested parties, nor from secretaries who have not been present during the experiments.

We make these remarks in the interest of the pateutees, as well as of the mining public. It will be an injury to all interests to add another not fully convincing experiment, while absolute proof and convictiou will bring certain fortune to the patentees, and national benefit to the mining interest.

Grass Valley.

[Written for the Mining and Scientific Press.]

Mining in Plumas County.

THE INDIAN VALLEY MINE AND MILLS.

This property is situated in Indian Valley, Plumas County, belonging mostly to L. L. Treadwell, of San Francisco, and a very small part of it to John N. Blood, Superintendent of the mine and mills. The ledge was opened by J. Watherworth, and the claim is undoubtedly on the same vein as that on which the Crescent mine is located. The Indian Valley mine is N.W. of the Crescent; between both mines are some other locations on the same vein, viz, those of Charles Callahan and the Pennsylvania mine, both of which have been worked thus far with good results. On the N. W. side of the Indian Valley mine, on the same vein, is another location, the Union, belonging to H. Bidwell, but work is stopped, as the ledge was found much broken up, and containing no paying ore. The Indian Valley mine is opened by a perpendicular shaft 320 feet deep on the vein, and sunk on a chimney of pay ore. The width of this chimney is fully twenty feet, and it was from the surface to about 250 feet down from fifty to sixty feet wide; going deeper, this chimney runs very narrow, so that stopes on both sides had to be abandoned as the ore was not paying. The company keeps on sinking, but gets not more than from $4 to $5 a ton paying ore from the shaft at the present time. Their clean ups have been, since last spring, very small, only amounting to about $500 a week, with their 20-stamp mill. Last summer this company had always from $1,500 to $3,000 per week. A tunnel on the level of the upper mill has been run, and a drift made on the vein towards the shaft, but no paying ore was found. The company is now running, from this tunnel, another drift on the vein in the opposite direction, towards the east, hoping to find pay ore before they come to the boundary line of their claim. This drift is in about 300 feet, and in about 200 feet more they will reach the end of the company's claim. To all appearance they will not find any pay ore; the prospects of the company look certainly not flattering. The hoisting works on the top of the claim are new, and in good condition; the upper mill, of twenty stamps, in four batteries, is old and without any modern improvements, having only copper plates in the batteries, and in front of the same, blankets, but no arrangements to work the blanket-washings. The lower mill, of twelve stamps, formerly belonging to the Pennsylvania Company, is standing still since last spring, the Indian Valley Company having no quartz to keep both mills running.

THE NEW YORK QUARTZ MINING COMPANY.

This property is situated N.E. of the Indian Valley mine, in Indian Valley, Plumas County. The ledge was discovered some years ago by the Kitts Brothers, and through their agent, N. Wescoatt, was sold to a New York Company for $20,000. This company appointed N. Wescoatt, Superintendent, built a mill of twelve stamps, worked by water-power, and started work at the mill last fall. But soon it appeared that the ledge was not continuing, or at least that under Wescoatt's management no quartz could be found to keep the mill in supply. Wescoatt was superseded by Col. Perkins, sent out by the New York Company, and although work was still kept on to find the ledge or to find quartz at least, it was done without any favorable results, and to all appearance the New York Company will have to give up prospecting, and to add another idle standing mill to the many that are situated in the mining claims in California, which were started either unreasonably, or by incompetent parties, and which remain as constant causes of the distrust which is entertained by eastern capitalists of California mining enterprises. Both parties are to be blamed, and not the mines.

THE CALEDONIA MINE AND MILL.

This property is situated at Cherokee, Plumas County. It is the N.W. extension of the Kittle ledge, and adjoining the works of Fudkins & Kellogg. The Caledonia belongs to H. Bidwell, and some parties in San Francisco. The mine is opened by a shaft 150 feet deep. The company is working at the same time on another ledge called the Dunlap, running parallel with the Caledonia, but dipping in such a way that the supposition is that both ledges will meet at a certain depth, or prove to be the same ledge, which is split on the surface. The ore shows as well as in the neighboring claim, the Kittle, and a few days ago the Caledonia Company found some rich ore in both their ledges, promising to pay $15 per ton. The company last year erected a splendid new mill of twelve stamps, running with steam-power, and they kept the same constantly running on good pay ore.

THE ENTERPRISE MINE

is in Light's Cañon, Indian Valley, Plumas County. This ledge was discovered last summer by Mr. Wilmot, now Superintendent of the works. The property belongs mainly to O. D. Squires, cashier of the Pacific Bank, San Francisco. Regular work was commenced last spring, by sinking a shaft twenty feet deep on the ledge, which varies in width from two to twenty feet. Some samples of ore were worked in San Francisco, and the rich yield induced the owner to have a mill erected, which will be finished and in working order sometime next month. The most remarkable feature about the whole concern is the new style of mill arrangement. The working power is water, and the quartz is crushed, not by stamps, but by Wheeler's Crusher, and worked in Stewart's pan. The working capacity of the Wheeler Crusher is twenty tons, and the capacity of the pan from five to ten tons per day. There is no other quartz mine in the vicinity, but there are some gravel claims. The location is about eight miles N.E. from Taylorsville.

THE ELLIS MINE

is situated in Round Valley, Plumas County. It was opened in 1861, and worked for three and one-half to four years, paying very well all the time; but the company ran into poor rock, and finally quit work, the mine lying idle for some years. Alsop and Charles Rodgers commenced lately some prospecting work. They take the quartz to the old Dixie mill in Dixie Cañon, and they have succeeded in finding rock paying from $15 to $16 per ton.

F. B. S.

A Railway Train Destroyed by Nitro-glycerine.—Ten cars were burned and the locomotive and four cars demolished by an explosion near Urbana, Ohio, on the 29th of Sept. The car nearest the engine contained a quantity of nitro-glycerine, which had been smuggled on board, and this exploded, shattering the locomotive and four freight cars, and setting fire to the remainder of the train. A house, a quarter of a mile from the track was nearly demolished. An iron rail was thrown 300 yards from its bed, and bent like a piece of wire. Timbers flew in every direction, and the telegraph wires were thrown down a long distance from the train. The report was heard thirty miles. No one but the engineer was seriously hurt.

Steaming to the North Pole.—The last reports from the Swedish and German North Pole expeditions, is to the effect that ice barriers have been encountered, which retard their progress. The Swedish vessel is a steamer, and a supply of coal is laid up for it on the island of Spitzbergen. Seal hunting has been profitably carried on for some years in those waters by the Norwegians in steamboats. More is to be hoped, therefore, from the Swedish expedition, than from that of any other nationality.

Mechanical.

Cast and Wrought Iron for Building.—The following is from an article upon fireproof buildings, in the New York correspondence of the *Journal of the Franklin Institute:* Since a very recent date, solid rolled beams of wrought iron have been used for floor joists; before which time cast iron beams had been largely used, especially in England. Many accidents proved their unreliability, and beams built of plates and angle irons were substituted. In this country, the Cooper Institute was the first thoroughly fire-proof building ever built, the beams for which were rolled at Trenton. These beams were nine inches deep, and were rolled from a single "pile," and were necessarily about the largest beams that could be made by that method of piling. Not long after, Mr. John Griffin, of the Phœnix Iron Co., invented and patented a plan by which beams could be solidly rolled up to at least twenty inches deep, and as long as would in any event be required. Mr. Griffin's invention consisted in rolling flange-bars separately, piling the plates to form the web between them, and then rolling and welding the whole mass together. It may be interesting to note that this process was pirated by the English manufacturers, and is in vogue with them to this day. The supports for beams and girders have been always cast iron columns; but the wrought iron hollow columns are gradually being appreciated. Cast iron columns, when overheated, become as brittle as glass, and shiver, like glass, to atoms, should water be thrown upon them. Such columns will stand no great tension, or any unequal straining, and ought to give place to wrought iron ones, especially in warehouses or other buildings used for general storage purposes.

Solar Heat as a Source of Power.—M. Mouchot, professor of mathematics at the Lycenm of Tours, claims credit for the discovery before M. Ericsson had achieved the development of his ideas on this subject. He states that he constructed receptacles in which the solar heat might accumulate like the water of a running stream at a weir or barrier. For this purpose he took a metallic vessel of suitable form, and, after having blackened the outside, placed it on some sand, brick, or other imperfectly conducting material. He then covered it with a glass lid and presented it to the sun's rays, projecting into it from behind a considerable increase of heat by means of a metallic mirror. If the metallic reservoir be empty, it is easy to produce therein in less than half an hour the temperature of 200°. M. Mouchot, in 1861, thus caused water to boil, and the French Emperor himself, at Biarritz in 1866, made successful experiments with a small steam engine provided with a solar boiler or heating apparatus. The French rival of M. Ericsson asserts that he has at different times cooked meat and vegetables, baked bread, and distilled brandy by his process, and that he can adapt it to steam or hot-air engines. He is about to publish a work on the subject.

Carbon in Cast Iron.—At the Cleveland Literary and Philosophical Society (Middlesborough) meeting, recently, Mr. Crossley read a paper on the condition in which carbon occurs in cast iron. Mr. Crossley maintained that the commonly received idea that carbon occurs in an uncombined form in gray pig-iron and combined in white, is erroneous. He was of opinion that carbon occurs only in combination in both; as a gray carbide in grey iron, and a white carbide in white iron.—*London Mining Journal for October.*

Glass and Copper Compound.—A German editor says water glass and copper, when melted together can be cast or wrought under the hammer and rolled; making a new metallic substance of an orange hue, and so hard that a file will not scratch it. It is translucent, and capable of being wrought into beautiful ornaments.

Rock-Channeling Machine.—The Claremont (N. H.) *Eagle* describes a machine recently constructed in that town. It consists of a combination of six rotary drills pointed with black diamonds. The first trial was made with a block of Ohio grindstone-rock several feet in thickness. This block was cut completely across in thirty minutes, the drills passing down at the rate of six inches per minute. Grindstone rock is particularly refractory under the old system, the coarse fiber of the stone making havoc with the most carefully tempered edges of steel tools. The diamonds are so arranged that a ring is cut round a core, the latter being an inch in diameter, so that quite an assortment of good round whetstones were distributed among the lookers-on. A huge boulder was next bored; the "time" being two and one-half inches per minute. An examination of the cores revealed the ugly nature of the specimen—a very toughly conglomerated mass of flint-rock and quartz with granite base. The surface of the cores, however, presented as smooth and even an appearance as if turned in a lathe. A critical examination of the drill-heads detected no appearance of wear upon the exposed surfaces of the diamonds, or failure in the settings.

Oil Painting upon Zinc.—Prof. Boëttger has recently published a process consisting in the previous application, by means of a hard brush, of a mordant, composed of one part of chloride of copper, one part of nitrate of copper, one part of sal ammoniac, and sixty-four parts of water, to which is afterwards added one part of hydro-chloric acid. The zinc turns of a deep black immediately after the application, changing after drying (12 to 24 hours) to a dirty black grayish-white shade, upon which any oil-color, once applied, will adhere with the greatest tenacity.

To free Mines and Sewers from Foul Air.—We clip the following from the *Colliery Guardian:* Mr. Robert Smith submits the following process for extracting foul air or gases from mines, sewers, brewers' vats, and other places where foul air is liable to accumulate. It consists in attaching one or more pairs of bellows to the end of a pipe or pipes, the other end of which is in communication with the accumulated gas. The lower end of the pipe may be flexible, communicating with the foul air or gas, the upper end being attached to the inlet valve of the bellows. The bellows may be operated by manual or other power.

Railroad-car Axles.—A recent American invention is for making new axles, or repairing old ones, by bringing the ends to a welding heat, and casting over each a steel shell or outer covering by running the molten metal into a mold surrounding the end of the axle to an extent and of a size and shape necessary to form the journal, the steel becoming by a state of fusion incorporated with or welded into or on to the drawn or reduced heated end of the wrought-iron axle, after which the union may be more firmly established by hammering.

Steel from Poor Ores.—The Heaton process, which we have already noticed in the Press, is attracting especial attention in England. Prof. Miller, of King's College, recently reported favorably upon it, after witnessing the operation and making analyses of samples of the materials used and the steel produced. This is the method in which a mixture of nitrate of soda and silicious sand is introduced first into the "converter" and covered with a perforated cast-iron plate, and the molten pig then poured in.

New Submarine Lamp.—The London *Artizan* describes a new lamp invented by M. Cretin. It is furnished with supply and escape tubes of air, in the same manner as an ordinary diving dress; and in fact the same tubes serve for both the diver and the lamp. Gas, condensed in iron cylinders, is used as the combustible. A small fan, set in action by clock work, keeps up the draft and drives out the contaminated air.

Scientific Miscellany.

The Eclipse.

One of the scientific expeditions for the purpose of making observations on the great total eclipse of the sun in August last, was sent out by the North German States, and was under the direction of Dr. Vogel. They took up a position in the Arabian Sea, off Aden. The doctor gives an account of the proceedings, which we condense as follows: "On the day of the eclipse we rose at four o'clock in the morning. It was the task of the expedition to make a photographic view of the eclipse during its totality. For this purpose we had a long telescope with a lens of six inches, without difference of focus, and with a focal distance of six feet. This lens afforded a solar image of three-quarters of an inch in diameter, which was taken upon a photographic plate by means of an ordinary sliding chest for two images.

The totality at Aden was about three minutes,—in India five minutes long;—we had chosen Aden for our station because there were already photographic observers in India, and because the totality appeared at Aden about an hour earlier than in India. Therefore a comparison of the different results would enable us to decide the question, whether the *protuberances* appearing at a total eclipse of the sun were changing in the course of time or not. We had previously exercised ourselves in the handling of the telescope,—like artillerymen with their guns,—and found it possible to get three plates, of two images each, within three minutes. Dr. Fritsche prepared the plates, Dr. Zenker put the sliding chests into the telescope, Dr. Theill exposed, and I developed. When the decisive moment was advancing, the sky, hitherto covered with clouds, showed some openings, through which the sun, already covered partially by the moon, was to be seen. The landscape around was illuminated by the strangest light,—a medium between moon and sun light. The sun crescent became smaller and smaller, and the opening in the clouds seemed to increase. The last minutes before the totality (which began at twenty minutes past six o'clock) went rapidly. Our work began; we exposed the first plate; I poured the iron developer over it, eager to know what was to come. And now I saw the image of the sun appearing. Its dark margin was surrounded by a series of peculiar elevations, the other side showed a strange hook; the phenomenon being exactly the same in both views. My joy was great, but there was no time for enjoyment. I soon received the second, and, after another minute, the third plate. 'The sun is coming forth!' exclaimed Dr. Zenker. The totality was over. All this seemed to have been done in a moment.

When I developed the second plate I perceived only very weak traces of an image. The clouds had veiled the sun at the very moment of the exposure. The third plate gave two brilliant views, with protuberances at the lower margin. Glad to have obtained so much, we washed, fixed, and varnished the plates, and immediately took copies on glass, to be dispatched to Europe separately."

Interesting Experiment.—We clip the following from the *Colliery Guardian* of Oct. 17th: "At Forres, the ordnance survey officers have discovered an extraordinary deflection of the plumb line. There are no mountains near to cause this, and it is believed that there is a mass of unusually solid matter beneath the surface at Forres, or else a large cavity in the sea, which is not far distant. To ascertain this, two clocks are to be placed east and west, one at Forres, the other 40 miles distant; by the side of each clock there will be a magnet, connected with the opposite clock by an electric wire. The magnet will be made to click, so as to mark the vibrations of the pendulums of the distant clock, and the differences in the vibrations of the pendulums will reveal the force and direction of the deflection of the plumb line."

Cast-iron Stoves, again.—We have already alluded to the experiments of MM. Trorst and Deville as proving that cast iron at a certain heat became pervious to gas. They have shown that the air surrounding a stove so heated is saturated with hydrogen and oxide of carbon. General Morin has recently brought up the subject again before the French Academy of Sciences; and in corroboration of the theory of the above named gentlemen, he related some experiments performed by M. Carret. Thus, after having remained during one full hour in a room heated to 40° (centigrade) by means of a sheet-iron stove, M Carret perspired abundantly, got a good appetite, but felt no sickness whatever; he had obtained the same result with an earthenware stove; but the experiment, when performed during only one-half hour with a cast iron stove, had brought on intense headache and sickness. M. Deville, at the same sitting of the Academy, supported these views with warmth. The danger which attended the use of cast iron stoves, he said, was truly formidable. In his lecture room at the Sorbonne he had placed two electric bells, which would be set in motion as soon as hydrogen or oxide of carbon was diffused in the room; the two cast iron stoves had scarcely been lit when the bells began to ring.

The Source of Light in Flame.—Prof. Frankland delivered a lecture in June last before the Royal Institution, in which he showed the fallacy of the commonly received opinion that all artificial light was due to the ignition of solid matter. We have before alluded to the lecture; we give here a part of the concluding portion: "It is to the behavior of hydrocarbons under the influence of heat, that we must look for the source of luminosity in a gas flame. These gradually lose hydrogen, whilst their carbon atoms coalesce to form compounds of greater complexity, and consequently of greater vapor density. Thus marsh-gas (CH^4) becomes acetylene (C^2H^2), and the density increases from 8 to 13. Again, olefiant gas (C^2H^4) forms naphthaline ($C_{10}H^8$), when the vapor density augments from 14 to 64. These are some of the dense hydrocarbons which are known to exist in a gas flame, but there are doubtless others still more dense; pitch, for instance, must consist of the condensed vapors of such heavy hydrocarbons, for it distills over from the retorts in the process of gas-making. Candle flames are similarly constituted. The direct dependence of the luminosity of gas and candle flames upon atmospheric pressure also strongly confirms the view that the light of these flames is due to incandescent dense vapors.'

Oxygen from Atmospheric Air.—M. Mallet has devised the following mode of preparing oxygen gas from the air: Subchloride of copper absorbs the gas, and is changed into an oxychloride, which, when heated to 400° Cent., gives off its oxygen and is reconverted into the subchloride. He places this copper salt in a horizontal retort which can be rotated, mixed in sand or clay to prevent its melting together. A gentle heat is applied to the rotating vessel and the gas collected. One kilog. of chloride furnishes 28 to 30 litres of oxygen. A stream of air is then passed through the retort, and in three hours its contents can again be heated.—*London Artizan.*

Thymic Acid.—This acid, obtained from the essential oil of thyme, has been proposed as a succedaneum of carbolic acid or creosote. It emits no disagreeable smell, and is powerfully antiseptic. Its composition is $C^{20}H^{14}O^2$. In a concentrated form it may take the place of nitrate of silver; and, as an antiseptic, it should be dissolved in 1,000 parts of water, with the addition of a little alcohol.

Organisms in the Human Blood.—Dr. Richardson, of Union Springs, N. Y., has arrived at the conclusion that living organisms in decomposing beef tea, when ingested, may enter the circulation and increase there. He bases his belief upon experiments made on himself, by microscopic examination of his blood at intervals after taking four ounces of beef liquid, which, according to his calculation, contained 27,000,000,000 of living organisms.

A Noted Horn Silver Deposit in Chili, Resembling White Pine.

THE HILL OF CHANARCILLO.

The extracts below are taken from an article entitled "The Geology and Mineral Veins of the Hill of Chañarcillo, Chili, by Edward B. Dorsey, M. E.," (published in Blake's Mining Magazine, p. 102, 1860) and will afford data for comparison with, and for judgement concerning the future of Treasure Hill, White Pine. Accompanying the article in question is a section along the great metalliferous vein of the hill, showing simply a series of alternating limestone and eruptive strata; both of which were necessarily deposited at the bottom of an ocean, the latter as successive submarine lava flows, which were separated by periods of limestone formation, under circumstances very similar to those attending the Derbyshire interstratification of dolomitic limestone and trap, or toadstone, described in the PRESS of Nov. 7th. The principal vein represented by the section, being a true fissure, had been worked to a depth of 1,600 feet, and over two miles in length. It had chlorides near the surface, sulphurets below; and was not affected in passing through the porphyry; but mention is made of a set of little segregated veins, two inches to two feet in width, of different dip and strike, which could not be traced in the porphyry.

In several of the upper of the dolomitic limestone strata, floors or beds, and stockwerks of horn silver of immense extent and value, had been deposited horizontally to a considerable distance, evidently by infiltration from the great central vein. The rich limestone stratum was about thirty feet in thickness. Mining was done on the coal and stockwerk principle, and when the ore had been extracted, the hill was allowed to cave. Mr. Dorsey says:

The principal silver districts of Chili, are Chañarcillo, Agua Amarga, and Tres Puntas; all are situated in the limestone formation of group 2.

Chañarcillo has been, as it is still, the most important and richest. It is situated about fifty miles from the ocean, forming the southwest extremity or terminus of a spur of hills, that runs from the coast range in a S.W. direction, having on each side wide valleys, which bear unmistakable evidence of having been large water courses at no remote period, though they are now dry. The valleys unite 2½ miles to the south of the hill of Chañarcillo, forming the northern end of the plain that extends south to the river of Huasco.

The summit of the hill (Candelaria Mine) is 1,000 feet above the level of the valleys, and 3,952 feet above the sea. The spur or ridge of which this hill is the terminus, gradually rises in hight until it attains its maximum of 5,600 feet above the sea, at a distance of twelve miles from this place.

As will be seen by the sections and specimens, this hill, as far as explored, is composed of nine primary strata, each of which is subdivided into many secondary ones, with an average dip of 11 per cent., from the N. E. to S. W., which is also the direction of the veins. The section is made from data taken from the workings on the principal vein, and the only true or fissure vein in the hill.

The strata occur in the following order, commencing at the surface:

A. Limestone, very broken, with many crevices that are filled with crystals of carbonate of lime, and a chalky argillaceous earth: the veins in this have not been productive; average thickness, ninety feet.

B. Metalliferous brecciated strata of limestone, cemented together by carbonate of limo, crystallized, or in loose powder united with argillaceous matter. This heaves or displaces the veins horizontally about fifty feet to the west—that is, the part of the vein that is below the strata, is that distance to the west of the superior part. This has the character of the stockwerk deposits of the Germans, being crossed by numerous small veins in every direction; the majority and richest, however, have a N. E. and S. W. direction. The ore from this stratum, after being assorted by hand, seldom yields above .0015 per cent. of silver. Thickness, forty feet.

C. Blue limestone—dolomite. This is the most productive stratum of Chañarcillo, having produced .75 per cent. of the gross product. Some of the secondary strata of this are much more productive than others, for which no rule can be established. Thickness, 500 feet.

D. Porphyry,	Average thickness	230 feet.
E. Limestone,	" "	100 "
F. Porphyry,	" "	490 "
H. Limestone,	" "	90 "
H. Porphyry,	" "	100 "
I. Limestone,	Thickness thus far,	110 "

The deepest working in the hill is at present in this stratum, (I) the vein yielding very rich ore.

The principal vein has been productive in all the limestone strata, though the yield has decreased as the depth increased.

The strata called limestone are composed of carbonate of lime, carbonate of magnesia, and argillaceous matter in very variable proportions, forming generally an argillaceous dolomite.

The most usual ores of silver found above the first porphyry stratum are, bromide of silver, chloride of silver, chloro-bromide of silver, and native silver; below it, the simple and compound sulphurets, arsenical silver, and native silver. Iodide of silver has been found in small quantities.

In the superior strata, the gangue is generally crystallized and massive carbonate of lime and peroxide of iron, forming a calcareous-ferruginous mass, in which the ore is found in laminæ, crystals, or disseminated through the mass. In the inferior strata, the peroxide of iron is generally replaced by the sulphuret of iron and arsenic.

Galena and blende are rare, and generally poor, even when found in contact with rich ore.

Quartz and sulphate of barytes are also rare and seldom found with silver; they are regarded as unfavorable signs.

Native amalgam has been rarely found, and no gold or copper.

The quality and quantity of the silver ore varies very much, in some cases yielding 90 per cent. of pure silver, while the present average is not above 1 per cent. Ten years ago, a mass of chloro-bromide of silver and native silver was found near the summit of the hill (at the depth of 100 feet) that weighed about 45,000 pounds, yielding 75 per cent. of pure silver.

The mines are perfectly dry; occasionally a small stream is found leading from cavities or other deposits of water, which ceases as soon as they become drained.

The silver has been deposited, or at least a part of it, in the veins at a comparatively recent date, subsequent to the origin of the slides and faults, they being frequently impregnated with silver. Moreover, chloride of silver, bromide of silver, chloro-bromide of silver, and native silver, are very often found encrusting and being encrusted by crystals of carbonate of lime, bearing unmistakable evidence of having been produced by causes that are still in operation.

Chañarcillo was discovered in 1832; since then about 300 mines have been worked, producing a total of $60,000,000, nineteen-twentieths of which have been produced by twenty-five mines. At the present time, seventy-eight mines are worked, employing 1,200 men, producing monthly 12,000 quintals (1,200,000 pounds), or 8,000 pounds of pure silver.

The yield has decreased very much lately, and will probably decrease much more, as there remains but little ground to explore in the upper limestone strata, where the segregated veins have been the most productive—in fact, many that have been very rich in this stratum, have been entirely unproductive in the lower strata.

My experience in the hill of Chañarcillo enables me to make the following general deductions; which, however, are only *applicable to this particular district:*

The same stratum has the same effect on different veins—that is, if one vein is rich, there is a great probability of others being so, passing the same stratum.

The same cross-vein has different effects upon different veins.

After passing a certain nominal depth, the veins become less productive in proportion as the depth increases.

The productive veins run from S. W. to N. E., with underlay to the west.

The veins have been generally richer near the faults.

The veins have never yielded any silver in the porphyry strata.

MONTHLY COMMERCIAL RECORD AND BUSINESS DIRECTORY.—F. R. Voight, of No. 33 Merchants' Exchange, publishes monthly a pamphlet of seventy-two pages, containing a considerable amount of information valuable for reference, relating to business, transportation, traveling, etc.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Engineering.

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

ON RAILROAD ACCIDENTS.

This Society held its regular fortnightly meeting at room No. 24, Cooper Institute, on the evening of Nov. 10th, the President, James A. Whitney, in the Chair, when the regular subject of the evening—"Railroad Accidents, their Causes and Remedy"—was taken up, and an elaborate paper was read by Dr. A. W. Hall.

After a few introductory remarks relative to the origin of the steam engine and the wonders it had achieved, he proceeded to a classification of railroad accidents, and to point out the most obvious means of guarding against them.

All that class of accidents resulting from the carelessness of the employés of the road, such as misplaced switches, open drawbridges, etc., he characterized as no better than manslaughter where they resulted fatally, and the only remedy was for courts and juries so to convict, as a warning to others, and by finding the highest exemplary damages against such companies it would be very apt to secure in the future a selection of more careful and competent men for such important places.

He then passed to the subject of collisions, such as direct, where locomotives meet, and indirect, where a following locomotive collides with a rear passenger car. He arrives at the conclusion that no collision need ever occur, aside from criminal carelessness of those in charge of the trains, where there were accurate time-pieces, a perfect time-table, a well-understood set of signals, and a telegraph office at every station.

The class of accidents known as obstructions on the track, such as horses, cattle, trees, rocks, etc., was next analyzed, and the penny-wise and pound foolish policy of companies neglecting to fence in their roads to save expense, was alluded to in no very flattering terms; and he referred to companies leaving trees and overhanging boulders in close proximity to the track, and when they fall and cause a smash-up to throw the blame on the Almighty for not suspending the law of gravitation. He argued that the only safeguard was a perfect system of brakes under the direct control of the engineer, to be instantly applied by the force of steam to the entire train; as he was the first to see the danger, he should have it in his power to apply the remedy, and he referred to the improved calcium head-light for locomotives to aid in discovering obstructions in the night time, so as to check the train in time to avoid danger.

The breaking of axles of locomotives and cars was then alluded to, and the writer asserted that, as strange as it might appear, there was no device in use on any road for proving these axles and testing their soundness, and that it was impossible to know if the driving axle was broken half off directly inside the driving wheel, as its position rendered it impossible for it to be seen; and he condemned the engineering skill of the road that would run such daily risks from flawed axle, when a simple testing device could be so easily constructed.

The burning of human beings alive in our fashionable wooden tinder-boxes, called cars, was severely criticised, and the whole system of making cars of anything but iron, or using stoves or kerosene lamps was denounced as behind the age. He marked out a simple plan of heating cars with hot air from a furnace car connected with the train for that purpose, and showed how the same apparatus, pipes, flexible couplings, etc., could in hot weather be converted into a ventilating device to convey cool air to the cars and keep out the dust.

The writer then took up the class of accidents most destructive of life and property, namely, those resulting from the breaking of rails, and compared the merits of steel and iron rails, and showed the impossibility to prevent breakage, of whatever material rails may be made, and said that the prevailing idea of the world was that some discovery or improvement must yet be adopted that would prevent cars from leaving the track when rails break, as there was no possible means to prevent them from breaking.

He finally introduced and explained his system of safety rails and safety wheels, which involved considerable expense, but would certainly prevent cars from leaving the track when a rail breaks. It consists of placing an extra set of rails so near the working rails as to allow the flanges of the wheels to pass between them. It is then proposed to cast the wheels with an extra tread to run directly over these safety-rails, but not to touch them (being less in diameter), unless the working rail gives way, when the wheel only has to settle a fourth of an inch to reach the safety-rail, and pass on without the slightest danger or jar. He showed many collateral advantages of this system, and as old and worn-out rails would answer every practical purpose of safety-rails, the cost was not beyond the means of railroad companies, and not too much for the advantages to be derived from the improvement. He concluded by expressing the belief that the national government should take the subject of safety on railroads into its own hands and prohibit stoves, kerosene lamps, wooden cars, etc., on the same principle that it compelled steamboats to carry life-preservers.

After the doctor had finished his paper, a number of gentlemen present took part in the discussion of collateral points bearing on the subject of safety to railway travel. Messrs. J. V. Smith, Dr. Richards, Rosevelt, Creamer, W. H. Smith of Pittsburg, and others took part in the debate, and made many valuable suggestions as to brakes, strengthening of rails, improved modes of casting wheels, etc.

Among the new inventions shown were a number of lamps producing a brilliant light, with the new patent wicks composed of animal and vegetable substances. It is German invention.

HUMBOLDT AND COLORADO RAILROAD.—At a meeting of the Board of Directors of the Humboldt and Colorado Railroad Company, held at Austin on the 21st inst., I. C. Bateman informed the Board that a map of the country through which the proposed railroad would pass had been prepared by Thomas J. Reed, County Surveyor, and was ready for the inspection of the Directors; and also that a pamphlet would soon be published containing full statistics in relation to the project. A committee was appointed to procure maps and collect information respecting the character and resources of the country, and to have the same published in a pamphlet and delivered to the representatives and senators, to be presented by them for the action of Congress. Two routes are marked for the projected railroad; the first connects with the line of the Southern Pacific road at El Dorado Cañon on the Colorado river, and sweeps northwest to the head of Reese River Valley, and thence bears nearly north through that valley to the Humboldt river, east of Battle Mountain district; the second connects with the line of the first about 100 miles from the point of beginning, and then extends in an almost straight line to the Humboldt river, passing between the Diamond and Ruby mountains and between the White Pine and Newark and Diamond districts.

FRANCE AND THE DARIEN CANAL.—It is not improbable that, though the project of opening a ship canal through the Isthmus of Darien has been undertaken by an American Company, Louis Napoleon may attempt to construct a rival canal in the interests of France. The fact that the late French Consul in New York has recently been appointed Minister to New Grenada, and that a party of eminent French Engineers have arrived in that State, on an exploring expedition, seem to bear out the theory that the astute ruler of France is turning his attention that way.—*Times.*

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, December 5, 1868.

Financial.

Our local money market is working more smoothly and more steadily than for a month past, with every prospect of increased ease by the 1st of January. The unusual activity which has characterized our Branch Mint for the past three months, during which period over seven millions of dollars have been coined, will prove materially beneficial at this season of the year when the Mint is about to close operations for two or three weeks. Much of the money disbursed for grain and other farm products, and scattered throughout the State, is now returning to the financial centre, and the stream will probably grow in volume for some time yet, as farmers are anxious to lay in their supplies of foreign commodities and manufactured goods before the rainy season becomes severe enough to impede land travel. Merchants and traders from the interior are also large purchasers, putting into circulation considerable amounts of cash.

Rates in bank remain rigidly fixed at 1@1½ per cent. per month for first class borrowers with the best collaterals; second class are accommodated at 1½@1¾ per cent. monthly. Gold bars are in fair supply at 850; silver bars rule, as usual, from par to ¼ per cent. premium; currency hills, on Atlantic cities, pay 33@33½ per cent. premium on gold; sight drafts, payable in gold, command 1 per cent. premium; telegraphic transfers, 1¾ per cent. premium; sterling exchange is quotable at 49d.; commercial exchange, 49¾d.; Mexican dollars are worth 4 per cent. premium. Gold in New York, on the 3d December, was selling at 135 1-8. Sterling hills, at 109⅞@110. With us Legal Tenders are quotable at 73@73½.

Our Branch Mint has been energetically worked since the 1st of September, having coined in the past three months not less than $7,465,000, being $2,455,000 in September: $2,415,000 in October, and $2,595,000 in November. The silver coinage for the last month amounted to $17,000. Gold deposits for November reached 140,000 ounces, and the silver deposits were 26,217 ounces. At the rate in which coin has been turned out for the past three months by our local institution, it would, in the course of a year, supply the market with $23,860,000, while the total coinage of the Parent Mint at Philadelphia, from the 1st of January to the 1st of October, did not exceed $1,700,000.

At the count of the money in the Treasury by the Governor and Secretary of State, there was found a total of $1,167,627 10—$1,045,033 in gold and silver, and $122,593 50 in Legal Tender notes.

Over a million and a half of dollars are inclosed in our City Treasury, making, between that and the State Treasury, over $2,600,000 locked up from business.—Very large amounts are also tied up in grain, of which there are over 4,000,000 centals yet to find a market. The Board of State Harbor Commissioners report the receipts for November at $38,000, in round numbers. It is very apparent that we have not nearly room enough at our wharves to accommodate the shipping which annually seeks our port. The number is steadily increasing, and at the same rate of progress made in the past three years, we shall soon need five times more wharf space than we can now supply.

Real estate transactions met with a decided check in November. Charles D. Carter, publisher of the *San Francisco Real Estate Circular*, accounts for it in the following manner:

Up to the close of October no dullness followed the earthquake. To it, however, undoubtedly we must in part attribute the quietness of the market in November. Other causes have been at work which had fully as much indeed, probably more—to do with the prevailing fall than the earthquake. Money was very scarce last month, especially in the early portion of it. This is a fact which all business men know, yet comparatively few are aware how very stringent the market really was. Upon some of the best mercantile paper 2 per cent. per month was exacted, and even at these rates borrowers in many cases experienced difficulty in obtaining requisite accommodation. This state of affairs, of course, had its effect upon the real estate market; but the chief cause of depression lay in the fact that the loan societies, during the first half the month especially, either had no funds on hand, or what is much more probable, they decided to hold off a little from loaning, in view of the monetary panic in New York, and the apparent sympathy which our money market manifested with it for a short time. Prophets by the dozen, too, were not wanting, who assured everybody that the temporary lull in real estate was the immediate forerunner of a general fall in prices, and even the slightest possibility of such a contingency justified the societies in declining to loan much until the barometer of events was closely scanned for a short time.—When the loan societies shut off their supplies of money, the effect must, as it did last month, become immediately apparent in real estate, because they are the great feeders of the pecuniary wants of that market.

We concur, in the main, with the foregoing view of the causes; but think that sufficient stress has not been laid upon the first mentioned—which undoubtedly had a very demoralizing tendency upon the market.

The steamer Montana, of the P. M. S. S. Co.'s Panama line arrived here on 3d December, in time to connect with the steamship China, bound for Hongkong via Yokahama. The China sailed on the afternoon of the same day with a large number of passengers and considerable freight. The propeller Montana will sail for Honolulu on Wednesday, the 9th December, carrying U. S. mails. The U. S. steamer Resaca recently arrived here from Mexican ports, bringing some $91,000 in Mexican dollars. This interference with legitimate commerce, on the part of the Government, should be stopped. So sensitive is it in some respects, that although possessing any number of teams of the best quality, it will let out large contracts for the transportation of army supplies, sooner than compete with private enterprise, yet, it feels no hesitation to compete against the mercantile community. Ships of war should be positively prohibited from carrying anything in the way of merchandise, whether goods or coin, in time of peace, or, unless it can be made apparent that unusually dangerous risks have to be encountered if sent by the usual channels.

City Stocks.

During the period under review sales of California Steam Navigation Co. stock were made at 52½ ₱ cent., and Spring Valley Water at $65@65 25 ₱ share. The latter company will disburse its usual dividend of ½ ₱ cent. on the 10th inst. The Gas Co. paid its customary monthly dividend on the first instant, as did also the Pacific Bank. At the close San Francisco Gas stock was sold at $77 50@77 per share, with large sales at the latter figure.

The Marine Premiums received by our local insurance companies, for the quarter ending October 31st, 1868, have been as follows:

Merchants' Mutual Marine	$56,972
Pacific	65,705
Union	62,059
California	41,049
Fireman's Fund	18,469
Occidental	6,389
Home Mutual	6,136

Mining Share Market.

Since our previous reference, the mining share market experienced a marked degree of activity, the aggregate sales showing a large increase, and most shares an important advance over rates that have ruled for a long time past. This is mainly due to the discoveries of the Yellow Jacket in their lowest workings, as well as the favorable appearance of other localities on the famous Comstock lode; besides, a speculative disposition always accompanies any material advance, thus bringing the general list into the market, thereby causing a largely augmented business, and in view of this the open morning session has been revived. The transactions as compared with last week show an increase of more than $700,000.

Yellow Jacket—has been in marked request during the past week, selling as high as $1,705, dropping to $1,500, and at the close realizing $1,507 50. It is reported that rich discoveries of ore have been made in the east drift, from the 900 level, ten feet thick, the assays of which run very high; also, that the north drift from the 800 level shows a body of good pay ore, said to be thirteen feet wide.

Imperial—advanced from $112 to $145, declined to $119@117, and closed at $115. On the first instant the Imperial-Empire shaft was 176 feet in depth below the 900 level. The drift running east, near the north line on the 900 level, is in hard quartz. Work has been suspended in drifting on the 750 level, having reached what is thought to be the east wall without finding any pay ore. They continue to extract about 140 tons of ore per day.

Kentuck—rose from $240 to $300, declined to $254, then sold at $275, and at the close realized $282. The receipts for November account so far reach $58,591 47. A dividend of $30 per share will be paid on the 10th inst. ....Savage sold quite largely at $67 50@83, then at $73, closing at $71.

Crown Point—sold within a range of $47@55 25, then at $48 50, closing at $48. During last week 360 tons of ore were raised, showing a value of $11,955. The bullion receipts so far for November account foot up $50,654.

Gould & Curry—advanced from $93 to $130, declined to $104, and closed at $105 50. The indications are favorable in this mine, as it is believed that the late discoveries in the Bonner shaft will lead to good results. Every body hopes so, as it will vastly revive the interest in the Comstock lode.

Chollar-Potosi—improved from $158 to $180, declined to $155, and closed at $158. During the week ending November 27th, 1,237 tons of ore were extracted from the Blue Wing body—937 from the stope and 300 from the cut—against 1,200 tons the previous week. On the first instant sent forward $10,605 in bullion. A dispatch of the 2d reads: "Quartz coming in face of north drift, 1100 level; carries no metal."

Amador—opened at $223, and rapidly advanced to $240. This mine looks as encouraging as it did several months ago. The receipts for November reach $47,000. The monthly dividend will likely be $5 per share.

Overman—has been moderately dealt in, selling at $49@64, then at $51, and closing at $49 50. Since our previous report, $11,126 in bullion came to hand.

Alpha—sold at $50@38, and closed at $38 50. An assessment of $10 per share was levied on the 3d instant..... Gold Hill was in the market at $50@55. The receipts for November foot up only $2,325 96, but the mill has been under repair for some three weeks. They had 479 tons on their dump on the 1st instant.

Annual Meetings.—Ophir on the 16th instant; Empire on the same day; Belcher on the 21st instant; Cole on the 9th.

Lady Bryan levied an assessment of $5 per share on the 24th of November, and Rising Star $10 per share, delinquent on the 5th of January.

Ingenious Safety-Lamp. — It is well known that many of the explosions in coal mines have been caused by the foolhardiness of the miners themselves, who in utter disregard of orders and of common sense open their Davy lamps in order to light their pipes. All the lamps which have been contrived have been capable of being tampered with in this way. But the *London Mining Journal* of Sept. 12th, notices a newly invented lamp which is not open to that objection. The screw which locks the lamp passes through in the usual way, and at a certain point an invisible pin drops into the said screw, which effectually prevents either tampering with the screw or the unlocking of the lamp, and the lamp can only be unlocked by turning it upside down, to allow the pin to return, which, of course, extinguishes the light, and all danger is past.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Golden Chariot Mining Co.—Owyhee County, Idaho Territory. Nov. 30th. Capital stock, $1,000,000; 10,000 shares, $100 each. Trustees: Hill Beachy, Mark Livingstone, George Hearst, J. J. Valentine, R. Bailey, G. W. Beaver and M. J. McDonald.

Wheeler Mining Co.—Esmeralda Co., Nev. Nov. 30th. Capital stock, $1,200,000; 12,000 shares, $100 each. Trustees: A. J. Pope, Clark Churchill, W. L. Palmer, A. H. Barker and Thos. Wheeler.

Virginia Silver Mining Co.—White Pine, Nev. Nov. 30th. Capital stock. $1,600,000; 1,600 shares, $100 each. Trustees: W. H. Sharp, Mark L. McDonald, John M. Byrne, Lafayette Loveland and Alvin W. Whitney.

Peoples' Insurance Co.—San Francisco. Oct. 30th. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: John Flannigan, Arthur W. Jee, J. E. Damon, H. W. Bradley, E. J. Delaney, Philip Meagher, B. Mendessolle, B. C. Horn, Robt. Haight, W. Fishel, D. Murphy and C. W. Kellogg. President, C. F. McDermott.

Mutual Aid Association.—San Francisco. Dec. 1st. Directors: Nathan Wentworth, R. A. I. Repiton, B. H. Wyman, I. R. Rives, Wyatt Birdsall and J. M. Murphy.

Long's Peak.—On the 23d of October, this peak, in the Rocky Mountain range, was ascended by the Powell Scientific Expedition. The usual observations were made, and a monument erected, in which was placed a tin case containing a record of the observations with date, names of party, etc. A flag was planted and left flying. This peak is a celebrated landmark. Its hight is 14,250 feet above the sea level.

Save your eyesight by procuring a properly adjusted pair of spectacles. Muller, 505 Montgomery street, understands how to adjust and adapt them to suit the eyes of every one.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Nov. 21st: The Imperial tunnel recently penetrated a small strata of a substanee which is a kind of glass of volcanic origin. In the early days of prospeeting here, the croppings of this same vein were located as eoal, and eonsiderahle excitement occasioned therehy.

The halance of the shafting and castings for the new mill of the M. C. M. Co., are on the way over from Sacramento and are expeeted to arrive in a few days. The work of sinking the pit for the turhine wheel is finished and the curbing will be put in next week.

Chronicle, Nov. 21st: On last Tuesday morning, a small shipment of silver hullion—61¼-lbs.—was made to San Francisco by John G. Slaven, Superintendent of the I.X.L. elaim at Silver Mountain. This hullion was obtained from 16 tons of ore, and without making a thorough elean up at the Pittsburg mill, where it was worked. Having no assayer here the value of the bullion could not he ascertained, but it is thought the ore has averaged $90 per ton.

Amador County.

Jaekson *Ledger*, Nov. 28th: The Wolverine mine is heing worked vigorously. They have reached a depth that requires steam hoisting works, and the same is being erected with all speed.

The Trowbridge mine is now being worked with energy. They are down 130 ft., and have a ledge about 18 ft. wide. We were shown some roek taken from it last Monday, which was very rich, being literally studded with gold-bearing sulphurets. This mine is located the second north of the Coney & Bigelow, and direetly on that range.

The boiler to he used at the Anaeonda mine, has been "set," and in a few days active operations will be eommeneed in the shaft. This mine is looked upon as one of the hest in the Pine Grove region.

Los Angeles County.

Los Angeles *News*, Nov. 24th: By the arrival of a gentleman from Soledad, we learn that Polk & Kahle's 5-stamp mill cleaned up $1,000, from a six days' run. The mill of Searles & Yates will be completed by the 1st of January, and will contain five stamps, and like that of Polk & Kabler, will be run by water power. The utmost confidence is felt in the mines by those at work. Some 80 men are now engaged in those mines.

Mariposa County.

Gazette, Nov. 21st: The new quartz mill of Williams, Fine & Co., on the Buckingham Mountain, is nearly completed, and will be in operation in about two weeks. It is a very substantial affair, and will do good service. In fact, we know of no other mining enterprise in this region with brighter prospects of pecuniary success. The vein thus far fully sustains its character for richness, and the only perceptible change in it is for the better.

Nevada County.

Transcript, Nov. 25th: The Mammoth gravel claim is located above the junction of Little Deer Creek and Sailor Ravine. They have during the summer, blasted through a ledge of rocks at Donkeyville, below the junction of Deer Creek and Sailor Ravine, and have cleaned up the cañon, and as soon as they can get water will be ready to commence work. The basin opened by this cut has been for twelve years past a dumping ground for tailings, and it also opens a considerable amount of new ground. There is every prospect that the owners will make a first rate thing during the season.

Nov. 29th: The hydraulic miners are patiently waiting for water. Many of the claims are ready for work and will start up after the first good storm which gives sufficient water to fill the ditches.

A company of Chinamen have for several months past been engaged in mining on Deer Creek, below the bridge. They have constructed first rate flumes and sluices, and have worked the bed of the creek thoroughly and systematically. We understand that they have taken out excellent pay during the time they have been working.

Gazette, Nov. 25th: The Tecumseh mill, above Omega, commenced crushing rock last week from the Fidelity ledge.

Nov. 28th: The mine and mill of the New York Hill Mining Co., at Grass Valley, were disposed of at Sheriff's sale on Wednesday. The property brought over $10,000.

Grass Valley *Union*, Nov. 25th: So far as the prospects of the mines in and around Grass Valley are concerned, they never have been better. The North Star, the Empire and the Eureka mines all improve as the workmen get down on the ledges, which demonstrates their permanence. The Allison Ranch mine, "the richest gold mine in the world," will start up at an early day, the difficulties which have kept that rich treasure vault closed for two years past, having been removed, and the company now being harmonious. There can be no doubt but that the Allison Ranch mine will be again, what it was in the past, since when work was stopped there the rock looked as well as it ever did. The company will start in with all the improvements for saving gold, and an economical working of the "Ranch" will make more than one millionaire. The Coe mine is rapidly proving itself to be a valuable property, and will soon take a high rank in the market. The Idaho is among the leading mines, and continues to give forth a stream of steady pay. The Hitchen's and Larimer ledge is promising heavy pay. From two miles below the town on Wolfe Creek, to the head waters of that stream, two or three miles above, there are innumerable quartz ledges, any one of which will pay for working, as machinery improves, and as living and labor become cheaper. The late discoveries of good ledges in this district has had already a good effect on our town. The healthy state of mining affairs here can not but be gratifying to our people, as well as a matter of pride to the whole State.

The Eureka Co. have taken steps to procure a patent for their mine.

Nov. 28th: The Mutual Mining Co., working the Jim mine, at Graniteville, yesterday sent down to this place, $1,500, as the result of ten days' run with five stamps of their mill. The rock now coming out from the Jim looks better than ever before, and the ledge continues a very large one.

Nov. 29th: The Bovee mine is showing out splendidly. The ledge is good two feet in thickness, and the rock coming out shows free gold all through it, with the heaviest and richest kind of sulphurets. The walls of the ledge are beautiful, indicating a true ledge. If its present richness holds out for 300 feet down, the owners will be rich men.

While White Pine attracts so much attention, Grass Valley more than holds its own. The Empire mill is working rock which would, in any other district, be called specimen rock. Union Hill mill has ore which runs $15 to $20 per ton, and plenty of it on hand, and which can he easily mined. Frank Morse's crushing is going on at Ben. Macauley's mill, with an appearance in the batteries and on the plates, which indicates big results. The North Star has to mount guard over the rich rock which comes from its cars, and as it goes into the batteries. The Coe mine never looked better than it did yesterday. The Idaho is proving itself a second Eureka.

The North Star mill on Saturday cleaned up $19,000 after a twelve days' run. From the character of the rock now being put through, the next clean up will he better than the last by several thousand dollars.

Grass Valley *National*, Nov. 24th: The Providence Mining Co. have located 2,000 feet on the Grass Valley quartz ledge. This ledge crosses Wolf Creek west of Hill's Ranch.

Nov. 25th: The Mason Co. have located 200 feet on the John Bright ledge, in Grass Valley township, half a mile south of the Ione mine. The location is north of the Small Hope Co's ledge.

Plumas County.

Quincy *National*, Nov. 21st: C. E. Smith, just down from Jamison City, informs us that the Mammoth Co. have struck the ledge in their new tunnel, and, what is better still, some remarkably rich rock, represented as better than anything heretofore discovered in that locality.

O'Neill & Co. have again commenced work on their ditch, and will soon have the water on their claims in Nigger Gulch. The boys have some ground that prospects well, and expect to "catch it" when they get to piping.

The correspondent at Blackhawk writes: Blackhawk is, as usual, paying. Turner & Co. have taken out, this season, about $11,000. They have not yet got done "bottoming up" and will not be likely to get through this fall. Last week they took out over 50 ounces. Their claim is worked more systematically than any claim I have seen in the county—in fact, I believe that nowhere is the hedrock cleaned more thoroughly. Coleman & Co. are driving away after some more of those $500 nuggets. A few months ago this claim was sold for $50, and the knowing ones said it was not worth that. Now the claim is worth $600 to the share. Cashman & Bowers have dug a ditch from Plumas Creek, to work the bars on the river near the mouth of Blackhawk. They are now ready for the water. Anderson is drifting away on high bars. He makes $4 to $5 a day when he is on the lead. Killey & Archer are driving away with their tunnel. They are getting some good prospects, and will have good pay, unless all signs fail. Johnny Radley is opening the old Pioneer tunnel, at Newtown. He expects to make "summit," and we think he will, as the last set of timbers put in paid two ozs. Quite a number of claims have been located on the ravine above Dr. Coleman's elaim—cause why?—that $500 slug of course. Their is but little doubt that the lead runs from Coleman's claim, on Blackhawk, through to Newtown. John Ball is fitting up his claims for the spring run, at Logansport. In cleaning up, he averaged $4 per day.

Sierra County.

Downieville *Messenger*, Nov. 28th: The owners of the Wolf Creek mine have recently struck splendid rock in their works, and intend to start their mill in a short time.

The ore of the Gold Valley mine, which has heretofore proved refractory, owing to the immense quantity of sulphurets in it, is now being worked in a manner to save all the gold. The chief difficulty has been that the gold would not amalgamate by the usual process. They now use a wooden barrel, and a charge is usually run about 12 hours, when it is found that amalgamation has effectually taken place.

Grass Valley *National*, Nov. 27th: From a gentleman who has recently been engaged in mining operations in Sierra County, we hear most favorable reports concerning the quartz mines of that section. In the vicinity of the Buttes is a belt about a mile in width which contains a great number of well defined ledges. The ledges are bounded on one side by slate, and on the other by serpentine, are plainly marked and can be traced by the croppings for a great distance. All the ledges in this vicinity are very large, ranging from 10 to 25 ft. in thickness. One of the best mines is the Primrose, situated in Hog Cañon. For 600 feet the ledge advances 10 ft. in thickness. A shaft of 168 ft. has been sunk, and the rock shows well in free gold and sulphurets. Over $250,000 have already been taken from this mine from rock worth from $12 to $20 per ton. The Reis mine has a ledge from 20 to 25 ft. thick, is being worked and pays well, the rock yielding from $12 to $15 per ton. The Union mine is prospering well. Rock can be taken out and milled at an expense of not more than $7 per ton.

Siskiyou County.

Yreka *Union*, Nov. 28th: E. H. Hall, this week, showed us some fine specimens of gold bearing quartz taken from the Scoles ledge, in Clear Gulch a few miles below Callahan's Ranch, on Scott River. Considerable gold has been taken from quartz out of this ledge by means of an arastra. Mr. Hall informs us that there is an almost unlimited quantity of quartz of a quality equal to that he showed us.

Tulare County.

Visalia *Delta*, Nov, 25th: The correspondent at White River says: There is but little mining going on here at present. Malthy is about to crush a lot of rock which is richer by far, than any before taken out in this district. The Philadelphia Co. are getting ready to sink a very deep shaft; and that sums up mining matters. This district needs capital brought to develop it more than any mining district I have ever been in. I have not had a cent for three months.

Tuolumne County.

Sonora *Democrat*, Nov. 28th: Work has been resumed on the Tuolumne Mountain or Buchanan mine. Eight men have been at work for some weeks past getting out rock. The mill will soon be started and the rock crushed.

Many excellent mines are now lying idle that could, with proper management, be made to pay well.

Yuba County.

Marysville *Appeal*, Dec. 1st; We were informed yesterday by Mr. Leland, of Brown's Valley, that the Pennsylvania mine has any quantity of paying rock in level No. 10, and that the prospects of the mine are encouraging. The ledge has been opened 14 ft., and it is not known how much larger it is.

ARIZONA.

Prescott *Miner*, Nov. 7th: Noyes & Curtis' Quartz Mountain mill at Nickenburg, is kept running all the time, and yet they cannot supply the demand. The Willow Creek Co's mill is also kept busy at work, but so far, has not been able to keep up with the demands of its customers.

Quartz mining is being steadily prosecuted at the Sterling, the Chase, and at Walker district. At latest accounts from the Sterling, the new incline shaft was down over 40 feet in the ledge, and at that depth a chamber, 30 feet in length, had been run in upon the ledge, which has disclosed a splendid looking vein of rich sulphuret ore. At points in this chamber, the ledge measures nine feet, but its general thickness averages fully 4½ feet.

A few days ago, A. O. Noyes, who, with George Curtis, has been engaged in prospecting the Chase mine for some time past, brought into our office a fine, large specimen of rock, a sample of that taken out of the tunnel which has been run into the vein a distance of 200 feet. The sample was of various colors, and looked very much like the richest Washoe silver rock, but Mr. Noyes assured us that the predominant metal diffused through it was gold, and that it carried lots of it in the small sulphurets and dimiuutive cellules visible to the eye.

French & Turner are working away on the Tie-Tie, in Walker's district.

Mr. Wunderlich recently showed us several pieces of rock from the Galena ledge, in Big Bug district, which we know to be rich. The sulphurets bear a close resemblance to those found in the Sterling mine.

Placer mining has not yet been resumed on Lynx Creek, Big Bug and the Hassayampa, but the miners are ready to pitch in as soon as the water comes. We are daily expecting news from Black Cañon diggings, Bradshaw mining district. Below Walnut Grove, on the Hassayampa, there are several claims that will pay well. At the Mexican Camp, on Lynx Creek, there is plenty of good ground, also, on Big Bug, Black Cañon, Slate, and other creeks. As soon as the hands now employed on the ranches get through with gathering and storing the crops, no doubt many of them will turn their attention to placer mining.

COLORADO.

Georgetown *Miner*, Nov. 12th: The Brown Co's smelting furnace is now in active operation....Work on the Baker mine has been resumed, and will be prosecuted throughout the winter. .... Schirmer & Bruckner have made some much needed repairs on their furnace, and have started up again on Terrible and Equator ore. It is expected the run will be the largest ever made here.

Central City *Register*, Nov. 5th: We saw yesterday 150 ozs. of bullion, from 20 cords of the ore of the Winnebago mine, a result that affords a fine profit ...Ten tons of ore from the Bobtail sold yesterday for $2,367.06. The ore assayed 11¼ ozs. in gold and 21 ozs. in silver per ton. and 9½ per cent. of its gross weight in copper.

The Knickerbocker, of 20 stamps, run by Mason & Ball, is the only one working at Empire. The stamps driven by water power are crushing ore from the Conqueror lode on Silver Mountain, which yields about $200 per cord. They expect to be able to run all winter. At North Empire the Steel & Yerkes mill is crushing surface ore from a lode of the same name. In this mill the Chilian process is used, which, although one of the oldest processes for saving gold, seems to work well on surface ore. With a 16-horse power engine to furnish motion, it crushes nine cords of ore per week, which yields about $100 per cord. They will be able to run all winter. Co'. Tindal expects to have his process running in the Peck and Leibig mills soon, so that in a few weeks there will be four mills running in that vicinity. Of the mines at North Empire the Conqueror is probably the richest that is now being worked.

The Livingston County lode has a shaft down 110 ft., which is yielding fine looking ore from a three foot crevice. The surface ore paid about $100 per cord. The Peck lode is yielding good surface ore. Silver Mountain, which is a misnomer, as there is no silver found in it, is one of the richest mountains in Colorado for gold, large portions of its surface paying well for sluicing.

Gold hullion, worth $7,000, was received yesterday at Clark & Co's bank, from Miller & Borham. It is from the ores of the Hunter lode. The mine is paying remarkably well.

Nov. 12th: During the last month the Rocky Mountain National Bank shipped $80,000 in gold bullion, and $3,000 in silver bullion ...Slawson, King and Collom will continue during the winter to work their several mines in the vicinity of Montezuma.

Prospecting and practical developments are being carried forward in Slaughter House Gulch, with a zeal never before manifested in this country. Each day brings something new, reports of enormous yields produced by the ores discovered.

A lode has been found at the head of Virginia Cañon, which has produced several nuggets weighing nearly half an ounce each.

Mr. Teats took out 3,000 ozs. of silver bullion last week from ores in Slaughter House Gulch.

Mr. Conlee, who has rented the Gilpin Co's mine on the Burroughs lode, has it in prime order. His timbering is complete, and he has commenced taking out ore which runs from 5¼ to 7¼ ounces of gold per cord.

Capt. Hoyt, who has just returned from Granite, reports great activity among the mines there, and the prospect for a good winter's work. Felton's and Morrison and Partridge's mills are running, and both doing well. Hayden's mill will soon start again.

Denver *News*, Nov. 4th: At the First National Bank this morning was a very fine lot of gold dust.

At the Colorado National Bank this morning were five bars silver bullion weighing 1,944 ozs., and valued at about $2,500 currency.

MONTANA.

Helena *Post*, Nov. 13th: From Blackfoot we have the most encouraging accounts of the increased prosperity of that usually favored locality. The claims all are paying very well—some are yielding very largely, and the camp is very lively. The present storm will retard mining operations very little.

J. M. Trevitt, who has just arrived in town from Silver Star district, reports very favorably in regard to the mining prospects of that district. His mill is at work day and night, crushing rock which yields very richly. The mill of Everett & Co. is hard at work upon the Green Campbell lode with very fine results.

From Mr. L. Bugher, who has just arrived from Phillipsburg, we learn that everything promises splendidly. The St. Louis & Montana mill is at work on rock from the famous Rumley & Bugher lode.

The snow in Lincoln Gulch does not in the least hinder the progress of mining operations.

From Mr. Rutan, who is just over from Jefferson City, we learn that a second run was made, which, like the first, proved a success. Mr. Rutan has demonstrated the fact that furnaces can be constructed, silver rock smelted, and the thing made to pay. This furnace, which was built under such disadvantageous circumstances, and operated so successfully, will be kept in full blast during the winter.

The German Gulch correspondent says that mining has ceased in the upper part of the gulch, with the exception of Dr. Beals and Harris & Co., and W. S. McClurg; these parties are still prosecuting their mining operations with great success.

Virginia *Democrat*, Nov. 12th: From a letter from Silver Star, we learn that the Woodruff & Hendrie mill is running day and night. The Madison County mill will start up in about a week. Jones & Erwin are running two arastras. Spires & Co. two, and Peter White one, each running with fine results and great satisfaction. Jones & Co. are negotiating for a mill in the East which will be out in the spring.

Trevitt's mill at Silver Star cleaned up 100 ozs. of amalgam from a four days' run, with six stamps. This run amounts to $1,500....Everett's mill is crushing rock from the Green Campbell lode, with splendid results....The Hendrick's mill, at Rochester, is also pounding away.

The Deer Lodge *Independent* says: The Highland Co's mill commenced crushing rock a week ago yesterday.

NEVADA.

Humboldt.

Unionville *Register*, Nov. 28th: On Monday next, the new mill of Stewart & Co. will start up on ore from their mine, adjoining Fall & Co's mine. They have now at the mill 75 tons of ore, and a large quantity more out at the mine, which will be brought down as fast as needed.

Virginia *Enterprise*, Nov. 28th: The Golconda mine is situated in Gold Run district, Humboldt County, and is now being vigorously worked. The company are now down on their ledge to the depth of 152 ft., where it has increased from a width of three ft. at the surface to seven ft. The ore steadily increases in richness as depth upon the shaft is attained. The shaft first cut the vein at the depth of 75 ft., when it was followed down on an incline to the present depth—152 ft. The claim consists of 2,000 ft. on the vein, and the incline is at the north end, while about 1,000 ft. south is a tunnel, some 90 ft. in length and all the way in the vein, which has here an average of four ft. and works $60 per ton at the company's mill. There are claims taken up for six or eight miles north and south of the Golconda and through the whole belt, which is in the Humboldt range of mountains. The ore appears to be of the same character. The principal mines in the immediate vicinity are the Register, Jefferson, and the Home Ticket. This last prospects exceedingly well on the croppings, which rise above the surface for the whole extent of the claim—a distance of 1,400 ft.

We yesterday noticed at the Bank of California a brick from the Chloride mine, Humboldt County, a bar of bullion weighing 1,518.40 ozs., which contained but $822.51 in silver and no gold. The bar looked very black by the side of the bullion of the Comstock range.

Reese River.

Austin *Reveille*, Nov. 24th: Four bars of bullion, valued at $5,121.72, were brought into this city yesterday, from the Monte Cristo mill at White Pine, and deposited in the office of David Lundhom, for assaying.

We saw to-day at the assay office of Boalt & Stetefeldt, a neat bar of silver worth $45, which was produced by 7¼ pounds of ore from the Eberhard and Keystone claims—at the rate of $6 a pound.

Nov. 25th: We learned through James M. Groves, of Belmont, that when he left there yesterday morning, there was a lively excitement respecting the reported discovery of something rich, a few miles southeast from Belmont. The story goes that an Indian brought into that town pieces of handsome ore, which yielded assays of $800 to the ton, and that he told his hearers there was a heap more of the same sort. His story and the ore which he brought with him caused great excitement, and when Mr. Groves left Belmont, nearly every man had gone to the spot pointed out by the Indian. As near as could he ascertained, the place is some 17 miles nearly southeast from Belmont, in a direct line with the course of the great El Dorado.

The Alpine *Chronicle*, of Nov. 21st, gives an extract from a letter received in that place from a gentleman at White Pine, who says: Most of the mines are worked through shafts that are sunk from 10 to 30 ft. through limestone, quartz and spar. The ore is horn silver, chloride and bromides. The pure horn silver is mostly sacked to ship to San Francisco, or is worked with poor quartz. The chloride is dry crushed and worked in pans to 85 or 90 per cent. of the assay value of the pulp. We have the Newark mill, of 20 stamps, the Monte Cristo, of five stamps, Captain Page's mill, of ten stamps, and Phillips' mill, of ten stamps. They reduce about 1½ tons per day of 24 hours to the stamp.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Nov. 25th: A German prospector, who has been out in the unexplored regions of the eastern portion of this State, informs us that a gold mine of extraordinary richness has lately been discovered about 45 miles south of Mammoth district. The rock is described as presenting the appearance of being half gold. Also, about four miles this side of Mammoth, a German had struck a very rich lead. The vein is in slate rock, some four feet wide, with a pay streak about two feet in width, and on one side the owner has stripped the rock away from the face of the ledge to the depth of eight feet. The rock thus exposed is literally spangled with free gold, and it is estimated that the ore in sight will pay $20,000 to the ton.

Nov. 26th: Some very fair looking quartz has been found by this company in the bottom of the Bonner shaft. The indications are good for finding ore at no distant day.

The Mexican mill, at Empire City, has been sold to the Yellow Jacket Co.

Nov. 28th: The total amount of bullion shipped from this city and Gold Hill during the last week, was 6,188 pounds of assayed bullion, valued at $150,378.03.

Although it has been known for some days that rich ore was struck in the Yellow Jacket mine, the great extent and immense richness of the deposits found was not generally known to outsiders until yesterday. This strike is one of the most important ever made in the mine or upon the great Comstock lode. It is the first very large deposit of extraordinarily rich ore ever found at so great a depth upon the lead. Two big deposits have been found,—one in the 900 and one in the 800-foot level, but the former is by far the richest, and in every respect the most important. The vein in the lower level is fully nine feet in width, and is composed of what is called "sacking ore"—ore so rich that it is not rudely shoveled and tumbled about, as is the case with that of a lower grade, but is put up in sacks and tenderly cared for. It is ore that will yield some thousands of dollars per ton, and is just the next thing to finding the silver already molded into bricks. The ore is composed of both chlorides and sulphurets, and is of a soft and crumbling nature—at least such was the character of all the specimens shown us yesterday. In the 900-foot level, about 90 feet north of the south shaft, has been found a large deposit of very rich ore, though it contains more iron and is not so much like the pure bricks as those below.

NEW MEXICO.

Central City (Col.) *Register*, Nov. 3d: Dr. Hobbs has just returned from the Cimarron mines. While he looks on that country as still a problem, he speaks in the very highest terms of some of its mines. He says he saw a single specimen weighing 12 lbs., from the surface of which $42 in gold had been rubbed from the outside, so that it could be transported without loss, and that the gold remaining and in sight on the specimen was variously estimated from $200 to $500. The surface of the specimen which produced it was six inches by ten. We learn from other sources that the lode which produced this specimen capped twice in 20 feet.

[Written for the Mining and Scientific Press.]

Smelting Operations at Owen's River---Meteorology.

EDITORS PRESS:—Mr. P. Desormeaux, of Cerro Gordo, informed me a short time since, that having been employed to run the furnace of Messrs. Belshaw & Elder, he smelted in three days fifteen tons of ore, which yielded eight tons of silver lead, containing an average of $250 in silver to the ton. And again, under date of 15th inst, he writes: "In seven days' work we have smelted 385 bars of lead, weighing about eighteen tons, containing an average of $250 per ton in silver."

All this lead is being shipped to San Francisco, at a cost for freight, of about four cents per pound. The fire-clay will stand in the furnace for thirty days.

The only serious difficulty at present encountered by Messrs. Belshaw & Elder, is the scarcity of water for the engine. This must be overcome in one of two ways; water must be carried to the ore, or the ore must be carried to the water. The first can be done for $16 per day; the second for $6 per ton. As the latter presents contingent advantages, it will, most likely, be adopted. There is no longer any question of the success of smelting operations here. Mr. Belshaw leaves for San Francisco to-day, highly pleased with the results of his efforts.

Owen's Lake, which has been rising ever since the earthquake of August 24th, continues to do so, and will apparently soon overflow at the south end.

The weather here is, at present, delightful, and from the immunity from high winds which we have enjoyed during the summer and fall, a light winter is expected.

C. H. A.

Lone Pine, Nov. 16th, 1868.

METEORS STRIKING.—When we consider that meteors and shooting stars are traversing the sky constantly in the day time as well as in the night time, though then invisible, it appears very remarkable that so few of them are seen to strike, and that damage to life or property from them is the wonder of a lifetime. At Sydney, on the 18th of August, (says a correspondent of the New York *Herald*, as the schooner Urania was passing Crowdy Head about half an hour after midnight a meteor, described as being "like a ball of fire," fell immediately over the vessel's stern, exploded with a loud report, like that of a heavy piece of ordnance, and killed the steersman, a man named Sales. Every one on board felt a violent shock like that of a volcanic battery, but no one, except Sales, was seriously injured. Sparks of the fire were scattered all about the deck, and the flash of the meteor was so brilliant that the steward, who was lying in a berth below, saw the fire through the caulked seams of the deck. His cabin was at the same time filled with smoke, which blacked some papers lying about. The paint on all the aft part of the ship was discolored, similar to what it might have been had she been "smoked with charcoal." A peculiar, indescribable smell was perceived for some time after the explosion, and a quantity of flakes like the soot from a steamer's funnel were scattered about the deck. The meteor apparently traveled with the wind, which was from the south. The body of Sales, the man who was killed, appeared to be blackened, but showed no other marks of injury.

The London Underground Railway.

This connected series of railway tunnels will be, when completed, some eight miles in length. Of the portion now open to travel, its financial success, and the difficultics attending its construction, *Engineering* thus discourses: "There are often at the same moment ten well-filled trains on the double line between Bishop's road and Moorgate street, containing three thousand men, women and children, who, so far as London above ground is conscious of their existence, might as well be in the coal cellars of their own homes. Yet in twenty minutes at the most, these thousands reappear in the streets, four or more miles from where they dived into the earth. * * * In no other capital, perhaps, in the world could the money have been found to make such a line. In no other capital, perhaps, would it have paid as the portion already open now pays, viz., £1,000 per mile per week of gross traffic, and 7 per cent. dividend upon a heavy capital account.

The underground railway has presented unusual difficulties, at almost every yard. The ground had to be studied almost inch by inch, filled as it was with the interlacing ramifications of half-a-dozen gas and water works, and the channels of the metropolitan sewers. In Park-crescent, a fine house, one in a large sweep of mansions, had to be carefully measured, its every detail drawn, then taken down, and when the railway had been completed just beneath it, rebuilt as before, and so exactly that you could not possibly distinguish it from its neighbors. The diversion of the large sewers was in many cases a delicate operation. In some instances, a 9-foot sewer is carried over, and in others under, the rails. The extension line was carried beneath the West London Railway, where the difference between the crown of the lower arch and the level of the upper rails was but a few inches, and this without the least interruption of a traffic of more than a hundred trains a day."

FOUR HUNDRED BARRELS A DAY.—The Titusville (Pa.) *Herald* says that on the 29th of September, the Vera and Blake well on the Pierson farm, Cherrytree Run, commenced producing petroleum at the rate of four hundred barrels per day, and has continued at the same rate up to date—the "biggest thing" in oildom since the days of the Fee well, on Upper Cherry Run. This well is nine hundred and fifty feet deep, and the sand rock is forty-nine feet in thickness. Pumping was commenced on the 26th or 27th ult., when the production started at the rate of two hundred and fifty barrels per day, and steadily increased.

FEMININE HOP PICKING.—Wisconsin papers describe lively hop picking scenes in the vicinity of Kilbourn, Baraboo, Reedsburg, and Oconomowac, where thirty thousand women (chiefly) were engaged, in gleeful spirits, at picking during the hop season. In ancient times women were foremost among the worshippers of the god Bacchus,—but what shall we call this? Is it a home counterpart to the pictures of adventure and gold-seeking in the west, where tens of thousands of energetic men are striving like grim devotees to attain that which never will bring them happiness?

FEELING THE PULSE BY TELEGRAPH.—The physician of a Chinese lady never thinks of such a thing as seeing or touching his patient. A string is tied around her wrist and the other end is held between the finger and thumb of the doctor, who stands outside the window in the cold. The string serves as a conductor to convey the pulsations to the *tactus eruditus* of this modern Esculapius; and having formed his opinion, and made his prescription accordingly, he takes his leave.

SORTING POTATOES.—A machine for sorting potatoes is manufactured at Freehold, New Jersey. The machine, it is stated, is of very simple construction, and performs its work at a rate of about one bushel per minute.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.

MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:
Saturday Morning, Dec. 5, 1868.

Notices to Correspondents.

CHEMICAL NOMENCLATURE.—The *rationale* of both the nomenclature and composition of many, indeed almost all organic compounds, is very little understood, even by the most profound chemists. This most elevated part of rational chemistry, chemical analysis, cannot afford any immediate indication, since its results represent each particular compound only by means of the amount of the respective elements obtained from any special compound. Their preëxistent state can only be arrived at by induction or by speculative ideas. It was the object of Laurent to reduce such phenomena by means of his "Chemical Method," to uniform and general laws. That Laurent, to use the words of Biot, has succeeded, we dare not affirm unhesitatingly; the work, however, possesses great merit, and deserves the most serious attention of the student.

IRIS.—Colored rays may be absorbed by employing appropriate media. This forms a mode of analyzing light, in addition to the prism. By the former method, Sir D. Brewster, after numerous carefully conducted experiments, arrived at the conclusion that there are only three colors of the spectrum which can justly be denominated simple, viz., the red, yellow and blue, - that these are found concentrated on those parts of the spectrum where each appears, but that they are also spread more or less over the whole, in consequence of which, orange results from a mixture of red and yellow; green from a mixture of yellow and blue; and the violet and indigo from red and blue, with a trace of yellow.

P. W., Reese River.—Amorphism is the opposite of crystallization. An amorphous body is void of all traces of crystallization; it has no power of double refraction, as many crystals have; no planes of cleavage, being equally easy or difficult, as the case may be, of separation in all directions, and exhibits when broken, not a granular, but a conchoidal fracture. According to Graham, an amorphous body contains a larger quantity of combined heat than one which has a crystalline structure.

L. S. M.—The tendency of all sciences, even those based on mathematics, is towards division. With chemistry, this appears to be specially the case, instances of which we may enumerate in the recognized but little known example, of lithurgy, or the chemistry of minerals; hyalurgy, or the chemistry of glass-making; phlogurgy, or the chemistry of combustible bodies; halurgy, or chemistry of salts, acids and alkalies; chromurgy, or chemistry of colors; zymotechny, or chemistry of fermentation, etc.

A. B., Virginia City, asks if it takes a certain amount of power to run a fly-wheel 100 revolutions per minute, what amount will it take to run it 200 per minute? The answer is: that to double the speed, power must be added equal to the square of the velocity,—that is, four times.

Practical Instruction in the Natural Sciences.

We hold that tinsel and imitation are not to be entirely condemned, since they lead us to appreciate the more that which is real. The world is not misled by them—unless it be so exceptionally, from the weakness of vanity, or from self-interest. So it is with education, of the two kinds, the ornamental and the real. Theoretical and unapplied education is little more than ornamental; like drawing, it becomes an accomplishment of value only when it is practically brought to use as in sketching from nature. The great, stupid, crocodile world, is not misled thereby, unless it be from some easily definable reason owing its cause probably to self-interest; in which case stupidity gets angry, but generally does not see where the laugh comes in.

Where so little patience is felt for anything that is not tangible and practical—amongst miners, or communities that have derived their tone from them—it would seem that the public educational institutions must be found as closely modeled as possible after the real schools of life. But it is a curious fact that where thought has become most rigidly theoretical, there instruction in what is valuable in connection with human arts and sciences, is found at once the most efficient and practical. Generalization of local details into science, is the parent of every live system of instruction. Thus schools in metaphysics, painting, astronomy, geology, etc., have arisen from time to time in history. But it is astonishing how few they were, and how simple and easily told are the fundamental principles they developed, underlying all our present knowledge.

If we are fit, and destined on this coast, to possess or to develop any living school which is to achieve advancement in a knowledge of our surroundings, and of the earth we stand upon, denominated natural science, our mining developments, if not our geological survey, will yet have to stand in the center.

In this view a visit made on Thursday to the Boys' High School, for the purpose of looking at Mr. Bradley's laboratory and mineral cabinet, proved of more interest to us than we had anticipated. More is offered at the High School in the way of facilities for practical education in mineralogy and metallurgical chemistry, than appears to be generally known.

A cabinet of minerals embracing all the leading species, is set up in a small, separate room, to which the boys have access for study, with the privilege of determining hardness and other physical characteristics; though we are unable to say to what extent they have been led in this important particular. But the facilities are unquestionably offered for the acquisition of a very complete practical knowledge of mineralogy. In larger and more special institutions there is too often a collection of many thousands of specimens, in glass cases, or with restricted access thereto, while small and characteristic working cabinets at all times accessible, are not provided; rendering the advantages for study sometimes inferior even to those offered at the High School.

If anything is wanting here it is in the instructing force. To teach mineralogy practically, in determining minerals, a teacher ought not to have more than a dozen or two students on his hands, and the less the better for the instructed. Each student has a number of minerals assigned to him for determination, with his Dana at hand, and the instructor stands by to show how the same can be done, and how all the difficulties are to be overcome. Mineralogy thus becomes a most enticing study to all who fairly begin it; for it is the science of natural combinations, of the affinities and intermarriages of the fundamental elements; and it is at the bottom of lithology, of metallurgy, and at the commencement of our knowledge of chemistry. Nature's beautiful combinations, as seen in a mineralogical cabinet, are such as to delight the eye with all shades of exquisite colors, with endless varieties of characteristic and pretty oddities of occurrence, and with forms of peculiar crystallization never varying in any given species. To know them is to know inanimate friends, which greet the eye wherever the foot treads, and underground. The miner who ignorantly digs, need not know them, except as orcs; but the man who hopes to turn them into money is not shrewd if he has not mastered both the nature of the elements in question, and the conditions which brought them together.

A Plattner's blow pipe laboratory, of the portable kind, put together by Lingke of Freiberg,—the best thing of the kind manufactured,—is at the service of students, in the mineralogical cabinet, but has not, apparently, been much used thus far. It is a perfect *multum in parvo* of chemistry by the dry process, and partly by the wet; an indispensable requisite in mineralogy as well as in metallurgy. The blow-pipe is the *eye* by which the miner and metallurgist can see what he is doing.

In another part of the High School building is the chemical and metallurgical laboratory. It is a large room filled with all the necessary appliances, mainly with a view to metallurgy,—embraced in qualitative chemistry and assaying. A cabinet of artificial oxides, etc., is a useful addition.

Comment regarding these features in the High School we deem called for in only one particular: that there is not as much evidence as there ought to be of these opportunities being freshly and constantly used. The students are there,—150 bright, ambitious-looking boys and young men, who, Mr. Bradley informs us, take much interest in the branches referred to. Whoever it was, connected with the Board of Education, that seconded Mr. Bradley's practical ideas in obtaining these facilities for the young men of San Francisco, ought therefore to see to it now that the Principal is properly assisted in making them available to those of his students showing evidences of inclination to take to that specialty. It is evident that Physics, Botany, Astronomy, and all the other general branches, cannot be efficiently and practically taught to 150 students at the same time with Mineralogy, Chemistry, Metallurgy and Geology, by one or two men.

The science and art of imparting knowledge has, in our day, attained such a stage of advancement that a world full of details may be presented to the mind of the student in a manner so methodical and in accordance with the great plan of nature, as to make all interesting, attractive, and fitted for a sure abiding place in his memory. We may all be Methuselahs by going backwards and living the Past, which is placed at our disposal; and the Methuselahs of science are, not seldom, those that also live in the future, for like begets like, as the past begets the future.

AUSTRALIAN MINING.—Under the advice of Mr. Darlington, a mining engineer who lately arrived from England, the Barra mine is to be worked in future by a system of trenching instead of mining. He has returned to England to procure the necessary machinery for the purpose. Silver mining has created much excitement in Australia lately. That country seems destined to take its cue from America.

THE ERIE THIRD RAIL.—A third rail is to be laid the entire length of the Erie Railroad between New York and Buffalo. The work will be commenced immediately. The object, of course, is to secure for the Erie Railway an unbroken narrow gauge route from New York to Chicago, both by the Buffalo and South Shore route and by the Canada and North Shore route.

Business of the Patent Office.

For the past few months the number of applications for patents awaiting examination have been accumulating, to the great annoyance of all parties concerned. In alluding to this matter, Nov. 4th, the *Scientific American* says the Commissioner appreciates the situation of affairs, and having had a few weeks rest, is determined to have cases acted upon promptly.

Judging from the new and vigorous regulations adopted since the appointment of Commissioner Foote, we certainly have reason to hope for decided improvement in the conduct of his department.

NO. OF APPLICATIONS, REJECTIONS, ETC.

From a statement furnished us by an ex-clerk, recently arrived in San Francisco, we find that the total number of applications made from April 1st, 1867 to April 1st, 1868, was 21,699; patents issued, 14,378; rejections, 7,321. The greatest number of cases awaiting action at any one time was in Aug., 1867, being 3,301. The least number on hand was 284 cases, Nov. 30th, 1867. No. on hand March 31st, 1868, 1,376. During the year the applications averaged 1,808 monthly. The rejections averaged about one-third of all the applications. (We were recently in error in stating that the rejections averaged about one-half the applications.) From 1st of April, 1868, to Nov. 1st, 1868, seven months, 7,707 patents were issued, averaging monthly, 1,101, showing an increase of 97 per month over the same period last year. This shows less increase than is noted in former years—the increase during the same months in 1867 over 1866 being 463 per month.

Last year seems to have been a season of remarkable activity among inventors in the United States, and it is not strange that the increase in patents issued for 1868 should not greatly exceed those for 1867. But California and Oregon, we are sure, will have an increased number for 1868.

DRY EARTH SEWAGE.—This system,—says a writer in the *New York Medical Journal*,—is destined soon to attract a large share of attention throughout the world from physicians, and from sanitarians generally. In public establishments,—such as jails, hospitals, etc.,—one very great source of trouble and expense, especially where there is no head of water with an abundant supply, is the arrangement of suitable water-closets, and subsequently the constant supervision and expensive repairs which they usually require. Dr. Allen, of the Jamaica Lunatic Asylum, has obviated the whole difficulty at one stroke, and not only gets rid of excrementitious matters by a very simple method, but actually makes it a source of no inconsiderable profit. He has secured this result by the adoption of the above system, which he calls the "earth closet." He found, on assuming charge of the asylum, the dormitories constantly offensive from the gases emanating from the badly constructed drains, and diseases generated thereby. He closed up all these at once, and in each closet placed a suitable vessel, and alongside a covered box of ordinary dry earth. This is the whole contrivance. A little of the earth, say two or three handfuls, are first thrown in, and after the vessel has been used the same amount is thrown over, just enough to cover it well. All odor is checked at once.

STATE UNIVERSITY.—The Regents of the University have accepted the design for a three story wooden building to cost $46,000. McClellan having declined the Presidency, that matter was recommitted. The list of professors is being made up; their first term of service is to begin next fall.

THE MERCANTILE LIBRARY FAIR season was brought to a close last evening by a grand masquerade ball. The institution has profited several thousand dollars.

Valuable Invention to Facilitate Brick-Making.

Several years ago, when petroleum springs and asphaltum deposits possessed the extraordinary power to charm wanderers from their path,—ranchmen from their routine duties, idlers from the hotel paradises of San Francisco, and all the carburcted hydrogenists in the country out of their laboratories, a party of men provided with some of the appliances for exploiting and testing petroleum, "might have been seen," gathered at ease around a cheerily smoking camp-fire in a ravine on the seaward slope of the Coast Range in San Mateo County; one of whom was amusing himself by throwing stones into the fire, and looking after the same as if to observe the effect it would have upon them. They were chalk-like, fine-grained, marly sand-stones, such as constitute the tertiary rocks of the Coast Range in these parts. One of these stones, being rolled out of the fire after it had become heated, was observed to emit a light blaze for half a minute or more after it left the fire. Subsequently it was discovered that the stones in almost any of the ravines from Half Moon Bay to Santa Cruz would exhibit a similar phenomenon. The rocks are saturated with mineral oil, which sometimes requires as much as ten minutes to burn out; and at first glance at the results in the fire, one might be led to mistake them for a very promising quality of coal. Brown coal or lignite *does* exist everywhere in the Coast Range in small seams of from one to three inches in thickness, from San Francisco to Los Angeles; a mine of the same being located about three miles from San Francisco on the road to the Ocean House, and Mr. John Centre, of San Mateo County, has found veins of excellent coal in San Mateo County, though not in quantity; so that the brown coal and petroleum in the Coast Range probably have some relation to each other.

One of the party above referred to was Mr. Silas H. Bowman, ranchman and brick-maker, of Half Moon Bay. A long time afterwards, when petroleum drills and derricks had utterly departed from the imaginations of the speculative, he set fire one night to a fresh-made kiln of bricks, composed of clay taken from a new locality, and retired. The ordinary time required for burning brick is twelve to fifteen days. Next morning he saw a keen blaze over the top of the kiln, which soon subsided, and to his surprise, on examination, the operation of burning was found to be completed. The cause was not immediately suspected—not until after a rain, in which water and oil were observed to have collected in the horse tracks on the clay bank. Analysis disclosed that the entire soil was impregnated with mineral oil.

The immense advantage of this mixture to facilitate brick-burning, was apparent. But the idea was carried beyond the confines of Half Moon Bay, and tried at the town of San Mateo, and at the State prison brick yards, with purchased crude petroleum, which is very cheap ($5 per barrel) in this market. The result, after a careful estimation of the economics of the question, was that a saving of two-thirds of the cost of burning brick could be effected by this process, no altcrations whatever in the kilns or in the method of burning, being necessary. Another effect of the use of this oil is that the bricks do not dry out so as to crack before burning, or get dry on the surface while they remain moist inside.

Crude, heavy, black, viscid petroloum, such as is thrown away in California, is the article used. It is mixed first with water, and applied with that in grinding the clay in the pug mill, or with the spade, or oxen, in from three to ten gallons per thousand brick. Wood costs in California about $5 per thousand brick, when used in the ordinary manner; with oil intermixed with clay, the entire cost of burning, including both wood and oil, is $1.50 per thousand brick. Tests of 150,000 brick in a kiln, at a time, have resulted in about these figures; and different kinds of clay have been found to answer equally well, in burning five different kilns; 500,000 brick having been burned in this manner.

The process having been patented by Mr. Bowman, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, we quote the following from his specification:

I first saturate the clay with water before it is ground in the usual way, and add to it from three to ten gallons of crude petroleum, and from 200 to 400 pounds of peat. The quantity of oil or crude petroleum and peat to be added, should in all cases be governed by the quality of clay used. Where it is entirely argillaccous or pure alumina, a greater quantity of oil and peat may be used; where it is principally a clayey loam, similar to the earth employed in California where my experiments have been performed, a less quantity of petroleum and peat is necessary, and I find that four, and even three, gallons will answer very well, and 200 pounds of peat for the manufacture of 1,000 brick.

As the burning of bricks is a matter of considerable difficulty, and requires an experienced workman, it may be said to be none the less so in the use of my improvements, as it is necessary to maintain an equal heat throughout the whole mass, and the fire should be kindled simultaneously in all parts of the kiln, and be driven as rapidly as possible through it, so that the steam and vapors will not be driven to portions of it where there is no flame or heat. The fuel to be employed may be wood or coal.

TO ARCHITECTS, ENGINEERS AND OTHERS. The Earthquake Committee offer a complimentary premium, a piece of plate (value $250) or that sum in coin, for the best plan for bracing and strengthening against earthquake shocks brick buildings, in the original construction of which needful precautions have not been taken; also a similar premium for the best plan for preventing the racking of wooden dwelling-houses, from the same cause, which are already erected.

Preference will be given to plans which can be adopted with the least inconvenience to occupants, the bracing in which "other things being equal," shall present the least objectionable appearance. The plans and specifications submitted are to be exemplified by diagrams, showing in the first case a brick store "25x60 feet" of three stories and basement, with chimneys, situated in a block, braced, as recommended, bearing in view the fact that adjoining property-holders may object to their walls being touched. And in the second case, a detached frame building "25x50 feet," having openings on front, sides and rear, with chimneys eight feet above the roof.

Plans to be scaled and accompanied with a fictitious signature, addressed to General Alexander, U. S. A., Chairman of Sub-Committee on Structural Designs, Chamber of Commerce, San Francisco.

All plans and designs, will be opened simultaneously on the 21st day of December, 1868.

The Committee reserve the right to reject all the plans submitted if not deemed sufficiently meritorious.

GEO. GORDON, Pres. *pro tem*,
Joint Committee on Earthquakes.

SETTING OFF BLASTS BY ELECTRICITY.—When a large blast consisting of a number of charges, in tunnels made for the purpose, is to be set off, the electric battery affords the best, and the cheapest, because the most efficient, means of ignition. The ebonite battery, which has been used for the purpose, is a little contrivance about the size of a door lock, having a crank the turning of which several times round, generates electricity enough to set off the charges to blow up a mountain. When all is ready, a stop is touched on the battery, and the explosion is instantaneous. Wires lead from the battery to the several charges, in which there is imbedded a little cartridge of fulminating powder, to set fire to the whole mass of powder at once. The following composition is recommended for this purpose by Dr. C. T. Jackson, of Boston, and is probably similar to that used at Hoosac Tunnel, where the ebonite battery is also applied:

Chlorate potash	600 grains.
Sulphuret antimony	250 "
Sulphur	5 "

It is pulverized separately and mixed with a spatula.

Earthquake Committee.

EDITORS PRESS:—Allow me to make a suggestion through your practical paper to the gentlemen who compose the committee for investigating the effects of earthquakes, which will really benefit this community, and give fair play for all opinions. A competition by treatises, as to the *best and cheapest methods for lessening and preventing its damaging effects* on dwelling houses, etc., it strikes me would accomplish the end in view most surely.

Offer from two to five prizes for public competitors,- say of the values of $2,000, $1,000, $500, $250, and $125,—for pamphlets from residents in this State, setting forth practical ideas for builders, to better resist the shocks of earthquakes, their respective merits to be judged by a well-chosen committee for that purpose, who are not competitors for the prizes. This will lead to the obtaining of all the best ideas on this subject, which is of far more value to us than theoretical inferences as to the cause of the phenomena, that will but follow the ineffectual reasonings of the best intellects of present and past ages.

Since writing the above, I have seen a somewhat similar advertisement from the said committee, in to-day's *Alta California*, but the prize offered is so contemptibly small ($250), and that, too, in the form of "plate," that considering how many should be encouraged to contend for it, and the extent of the work required, it will lead to nothing really beneficial to the public.

CORNUCIA.

San Francisco, Dec. 3d, 1868.

THE FINGER OF GOD.—A sermon thus entitled, by the Rev. A. L. Stone, has been published by request, in pamphlet form; having been delivered on the Sabbath morning after the earthquake of Oct. 21st. It is a fine effort to draw moral lessons from dangers ever impending and unavoidable.

ANOTHER CABLE.—A French company has been organized to lay a cable from Marseilles to Corsica, which will probably be extended to Algiers, and ultimately along the north coast of Africa to Suez.

THE NEW ENGINE in the Opbir mill, at Grass Valley, is 80-horse-power, instead of 18-horse-power, as was reported.

A GREAT many side hits are being made at the PLANTATION BITTERS by a score or two of disinterested friends, who are endeavoring to imitate or counterfeit them. It is all of no use. The people won't be imposed upon. PLANTATION BITTERS are increasing in use and popularity every day. They are in the same sized bottle, and made just as they were at first. They make the weak strong, the languid brilliant, and are exhausted nature's great restorer. The recipe and full circulars are around each bottle. Clergymen, Merchants, and persons whose sedentary habits induce weakness, lassitude, palpitation of the heart, lack of appetite, liver complaint, etc., will find immediate and permanent relief in these Bitters. But, above all, they are recommended to weak and delicate females and mothers.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it.- They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco 23v17-nym

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hunsbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel-saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

GODDARD & CO.
San Francisco, May 1, 1868. 18v16tf

SULPHURETS;

What they are;
How Assayed;
How Concentrated;
And How Worked;

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

DESTRUCTION OF FOREST TREES A SERIOUS MATTER.—The Sept. number of the *American Journal of Horticulture* has an article by John L. Russell, entitled "Some Notes on the Coniferæ of California." The redwood, *Sequoia Sempervirens*, is the last species named; and Mr. Russell concludes with some remarks upon its threatened extinction. He says: "The value of these majestic living organisms as bearing upon the features and conditions of the regions they inhabit, is well considered by Mr. Bolander, who asserts that a great benefit derived from the redwood forests is the effect which they have of condensing fogs and mists,—turning them into rain, wetting the soil, and furnishing the supply of the springs for the dry season. It is my firm conviction, that if the redwoods are destroyed,—and they necessarily will be if not protected by wise action of our government,—California will become a *desert* in the true sense of the word. It remains to be seen whether we shall be benefited or not by the horrible experience such countries as Asia Minor, Spain, and France have endured from having barbarously destroyed their woods and forests. No power on earth could restore the woods of California when once completely destroyed.

SCIENCE AT FAULT.—The Paris correspondent of the London *Times* alludes to Prof. Liebig's new chemical substitute for mother's milk, as follows: "This preparation was tried here in Paris on but four children, and these four it killed—two in three days, and two in four days. The experiment was made at the Lying-in-Hospital of Dr. Depaul, professor of clinical obstetrics of the faculty of Paris, and the children selected were those abandoned by their mothers. The artificial milk quickly brought on bilious purging and prostration. Of course, Prof. Leihig declaims loudly against the fairness of the experiment; but Dr. Depaul is a competent judge, and the whole Academy of Medicine, after a fair report from the chemists in their body have decided not to take the responsibility of a further experimentation with so dangerous a compound. 'What is the use,'—the Academy judiciously says,—"since we have in our hands so excellent a substitute, and so nearly analogous a substance, in cow's milk with the addition of a little water and sugar."

GRAIN FARMING.—The San Justo rancho of 21,700 acres, in Monterey County, has been sold by W. W. Hollister for $370,000, at the rate of about $17 an acre, to an association of fifty farmers, who have equal shares. Each is to have a homestead of 172 acres; 160 acres are to be reserved for the site of a town, to be called San Justo; the homestead of Hollister with 200 acres is also to be reserved; and the remainder, about 12,700 acres, is to be sold for the benefit of the Company. Most of the land is very fertile, and it is within twelve miles of Gilroy, so that the farmers can conveniently haul their grain to the railroad and return in a day.

The greater part of the Santana rancho, of about 24,000 acres, and a portion of the San Felipe rancho, of 44,000 acres, both in Monterey County, have been sold to grain farmers, so the sheep are being crowded away.

WATER BLASTING.—Blasting with powder is always extremely dangerous in mines with fire-damp, as the explosion of a charge has often been the cause of an explosion of gas. In order to avoid this danger, M. Guibal substitutes the pressure of water for the explosion of powder in splitting rocks. He employs an india rubber cartridge, which is introduced into the hole and filled with water. The water is then compressed to a certain number of atmospheres by the aid of a cylinder, the piston of which is worked by a compressing screw. Before the pressure of the water the rock splits without being projected, and the same hox or cartouch may serve many times.—*Colliery Guardian.*

SUBSTITUTE FOR BUTTER FIRKINS.—In Oregon butter is packed in muslin sacks, made in such form that the package, when complete, is a cylinder three to four inches in diameter, and from a foot to a foot and a half in length. The packages are then thrown into large casks containing strong brine, with a slight admixture of saltpeter, and by means of weights kept below the surface. The cloth integument protects the butter from any impurities that chance to come in contact, and being also protected from the action of the air, it has been ascertained by trial that butter put up in this way will keep sweet longer than in any other way.

CURIOUS FACT IN TELEGRAPHY.—The cable crossing the Mississippi at Memphis, one of the most perfect ever laid in the country, (originally made for the Red Sea) has been working irregularly for some time past. The *Appeal* says: "At intervals no communication could be had for hours, and all at once it would revive and the fluid pass through it as usual. This state of affairs contianed for several weeks, and at last communication ceased entirely. After several ineffectual attempts to revive it, it was determined to raise it and find out the reason for the cessation. By tests the trouble was found to be withiu a space of 20 yards between the points. This piece was cut out, the two ends spliced and the cable then worked as well as ever. The piece cut out was examined; and it was found that about four inches of the conducting wiro had been burned out, and was gone completely. It is supposed that a severe shock of lightning had passed along the land line of wires, and had left them and followed the cable, burning this piece out in its passage. Many theories are advanced by the gentlemen connected with the telegraph office hereas to the explanation of this remarkable phenomenon. The only one which is at all satisfactory is that of Col. Coleman,—that a slight conuection was formed between the burnt ends of the conductor by moisture which had penetrated the cable in sufficient quantities to keep up the circuit; there being a battery on the Memphis end strong enough to drive the electricity through at iatervals."

THE BEST VELOCIPEDES.—The Paris correspondent of the *Artizan* says: "For short distances and speed the two-wheeled velocipedes are the best; for long distances and speed, the three-wheeled ones; for longer distances with comfort and speed, the four-wheeled; that is to say, the two-wheeled are the most fatiguing, requiring great effort to keep erect, and have been considerably condemned by physicians; and therefore in long rides (between men of equal strength and practice) the three-wheeled generally win, while it is equally true that in the longer races the four-wheeled are the winners. The two-wheeled velocipedes have to be made so much stronger to stand the twisting and hard usage that they are full as heavy as the three-wheeled ones. The two-wheeled and three-wheeled kinds weigh about alike—50 or 60 pounds.

THE mining interests in Mexico are looking up, and in fact the prospects are brighter than ever before. A law has lately been passed by the general government allowing bullion and coin to be shipped out of the country at 2½ per cent. Seven American companies are taking out at the present time over $1,000 per day. Barney and others have cut in the San Miguel tunnel a vein three yards wide, paying $6,000 to the ton, between wall-rocks. Their best class of ores in said vein pays $17,000 in silver to the ton. The writer has seen several hundred pounds of this ore, and can testify to its richness.—"*M.*," *in the Bulletin.*

IMMENSE BALLOON.—A balloon four times as large as the largest ever previously made, and containing 350,000 cubic feet of gas, has just been constructed in Eagland. It is ninety feet in diameter, and capable of raising a load of eleven tons. Its cost was about one hundred and forty thousaad dollars. It is connected with the earth by a cable two thousand feet in length; and for this reason is named by its owner "The Captive." This cable is wound around a drum which is worked by a steam engine. It is owned by a company of Frenchmen. Thirty persous at once have made the ascent in it.

GRASSHOPPERS.—The grasshoppers were so thick on the Missouri Valley Railroad track, betweeu St. Joseph and Savannah, Andrew county, on the 4th of August, as to delay the morniug train two hours. The conductor was compelled to stop several times and have dirt thrown on the rails, so greasy were they from the remains of the crushed insects.

ETHNOLOGICAL.—Recent disclosures, proving positively the existence of a slave trade between the South Sea Islands and Queensland, have caused an influential committee to be appointed to call the attention of the English authorities thereto.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to

CAMERON, for the purpose of carrying on the business of Stair-Building, Wood-Turning and Scroll Sawing. The business will be conducted as formerly at Cameron's, corner of Market and Beale streets, and also at Nos 485 and 487 Brannan street, where ample steam power and all necessary facilities have been provided for every branch of the business.
Different sizes of Redwood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.
15v17-3m N. P. LANGLAND

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing tho papers, but the law demands that the inventor shall, in all cases, furnisb a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should he neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted oa it in a permaaent mnnner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should he sufficiently perfect, however, to show, with clearaess, the nature nnd operation of the inventioa.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvemcat.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or hy mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the ease is duly registered on our books, and the applicatioa proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will he called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Goverament last fee of $20 in currency will be required. The law states that every pateat shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to tho applicant or his agent. And if tho final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of tho separato ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our ngency, is ten weeks. We frequently got them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors oa this coast having their applications for patents made out through our ngency, can sign their papers at oace, and thus secure their rights at least *three months sooner* than by trusting the samo to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can he accomplished (if the iavention is a meritorious one) by illnstrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge;* the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washingtoa or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, nnd it has frequently happened that applicants have not only lost their money, but their inveutions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexations delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

Tbe branch of Patent Law is of itself a SPECIALITY of legal jurisprudence; or, as Mr. Phillips, an eminent patent lawyer, justly remarked: "Tbe metaphysics of the law."

In early days hut little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of aa infringement suit.

The general practice of the Patent Office regarding the examinntion or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for nll parties managing aa application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* and *experience.* As agents with such qualifications, we solicit bonest patronage.

Candid Reasoning.

A gentleman eminent for his ability in all points pertaining to specifications, gives inventors the following sound advice:

To properly prepare a specification may seem a very simple and easy task, but such is not the case. It requires a knowledgo of the arts, of scicnee and scientific terms, and their proper use—of mechanics and the principles that govern their action—of law, and of the grammatical and legal force and construction of language, wbich is possessed by but very few persons.

Lawyers seldom possess the mechanical knowledge, while mechanics still more generally lack the legal knowledge necessary to enable them to properly prepare a case for examination.

It requires such a *combination* of legal and mechanical knowledge, together with a special knowledge of the principles and rqles that govern the action of the office, that no person is really competent to undertake tho business but those who *have made it a study, or had experience at it.* In view of these facts I unhesitatingly advise every person who has an invention worth patenting to get some responsible and competent agent to attend to it for him.

No person scarcely would think of entering upon a suit at law without employing a lawyer to attend to it, and make out his papers for him; and if a sensible man would aot do that, much less would he attempt to prepare an application for a patent without knowing anything about the business.

I am awnre that persons frequently attempt it, but I am also aware that *many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given when once rejected.*

Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their iavention, and is therefore useless. It is for this reason that many applicants are compelled to reissue their patents at as great, and often greater expense, than the obtaining of the original.

Hence I repeat, every person having an invention worth patenting should employ a competent and responsible agent—I say *competent and responsible,* for, unfortunately, there are many who are neither competent nor responsible.

Caveats.

A cavcat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for cavcat papers with a copy of the laws governing the same, but does not seek to point out its incorrectness, unless there be some glaring defect.

If worth filing at all, these cases should be prepared with very great care and caution.

One intentor on this Coast, who had filed a cavcat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his cavcat was inoperative by reason of imperfections and his not having complied with the law in that case as made nud provided.

Our fee for a cavcat varies from $10 to $15. Tho Government fee is $10.

Inventors will oftimes find it very important to take advantage of the cavcat system—the expense under the law being comparatively small.

To enable us to prepare cavcat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition, no matter after the patent is issued to another. Filing a cavcat does not give the right to affix the words, "Patented, or "Patent applied for."

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procnre the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice aad then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secnre the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known wbether the patent will be granted.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except hy presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first governmeat fees.

Patent Rejections.

FIRST. Refusals nre nlways made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an nrtistic manner in Indin ink, and on sheets of the requnred size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally nttending to explain the enso (through our agent in Washington), *we charge no second fee,* as is the case with somo agencies, but attend to tho business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who havo rejected cases, prepared either by themselves, or for them by other agents, and desire to asertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We havo been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the iaventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all busiaess connected with it, varies from $20 to $40.

Following is the list of Governmeat fees, payable ia currency:

On every caveat	$10
On every application for a patent, for seventeen years	10
On every application for a design, for 3 yrs and 6 mos	15
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Illustrate your Inventions.

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicnously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in tbo columns of the MINING AND SCIENTIFIC PRESS. To do this ia the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation wo will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,
414 Clay Street, below Sansome, San Francisco.

SEPTEMBER, 1868.

Subscribe for the Mining and Scientific Press.

Tho PRESS was established in 1860, and has been enlarged from time to time, until it now contains sixteen pages—size of *Harper's Weekly.*

It is printed on extra quality of paper, rendering it a handsome volume to file for future use.

A large amount of editorial labor is constantly expended in the preparation of leading articles relating to the progress of scientific developments in various parts of the world; new discoveries in geology, mineralogy, metallurgy, and new processes and methods relating to mining in all its branches.

Illustrations are given of apparatus for saving precious metals, and of machinery and inventions of general interest.

Each number treats carefully on subjects of home trades, manufactures and domestic economy.

Our mining summary and weekly stock report gives the latest news from the most important mines and mining districts throughout the Pacific States nnd Territories.

An official list of patent claims issued to inventors on the Pacific Coast, is published in advance of all other journals.

The latest prices of stocks nre quoted; also tho produce and market rates, metal market and prices of copper ores.

"Answers to Correspondents" afford much of interest to readers and of advantage to tho community.

The Mechanical nnd Scientific Miscellany contained on a single page of each issue we are frequeatly told is worth the price of the whole paper.

Information contained in one article has been known to benefit a single subscriber aa hundred fold the cost of a year's subscription.

The PRESS, as a mining and mechanical journaal, has met with unrivalled success.

Samplo copies sent free on application.

Subscription, $5 per annum.

DEWEY & CO.,
Publishers, Patent Agents and Job Printers, 414 Clay street, between Battery and Sansome, San Francisco.

The Best Advertising Medium on the Pacific Coast.

Our terms for advertising in the MINING AND SCIENTIFIC PRESS are very low considering its wide circulation among the most intelligent and industrial classes

☞ All advertisements inserted in the PRESS are contained ☜
☞ in the MONTHLY SHEETS of the MINING AND SCIENTIFIC ☜
☞ PRESS, which (by special arrangement) are placed on ☜
☞ FREE READING in the principal hotels, steamboat and ☜
☞ steamship saloons, depots, and public libraries in San ☜
☞ Francisco, and the Pacific States. Many volumes are ☜
☞ also bound, thus affording permanent advertising. ☜

DEWEY & CO.

Job Printing.

We employ the best workmen in this department, and promise our customers—(many of whom have patronized the office for over eight years)—the best of work at very fair and uniform rates.

We are constantly adding new presses, type, and other material to our stock, making our facilities good for doing a wide range of work for merchants, mechanics, inventors, manufacturers, and tradesmen of all classes.

To ENGRAVING AND ELECTROTYPING, for illustrating books and circulars, we pay particular attention, guaranteeing our customers satisfaction in this line difficult to be secured elsewhere.

Printing in colors, bronze, plain and ornamental style promptly done. Especial care given to working engravings

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1867, by DR. G. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surfaces with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable. 21v.6-3m

RADICAL CURE
—OF—
RUPTURE!

And in accordance with law, and an order of the Board of Trustees, made on the sixteenth day of October, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., auctioneers, No. 327 Montgomery street, San Francisco, on Monday, the seventh day of December, 1868, at the hour of 12 o'clock M of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco. no21

Chipionena Mining Company—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of November, 1868, an assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOUSE, Secretary
Office, 318 California street, up-stairs, San Francisco. n7

Diamond Copper Mining Company, Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty eighth day of October, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 40 Merchants' Exchange Building, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. COOLIDGE, Secretary
Office, Room No. 40 Merchants' Exchange Building, California street, San Francisco. oc31

NEVADA CITY, Nov. 3d, 1868.

Messrs. Dewey & Co.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,

Very truly yours, Lee D. Craig.

Colorado Silver and Copper Mining Company, Arizona Territory.

Notice.—The Annual Meeting of Stockholders of the Colorado Silver and Copper Mining Company, of Arizona Territory, will be held at the Company's office, No. 713 Montgomery street, Room No. 40 (3d story), on MONDAY, DECEMBER TWENTY-EIGHTH, 1868, at 3 o'clock, P. M., for the election of Trustees and the transaction of such other business as may properly come before it.

nov14 B. W. MUDGE, Secretary.

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of November, 1868, an assessment (No 27) of one dollar ($1) per shares was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 28 Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Tuesday, the twenty-second day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 28 Merchants' Exchange, south side of California street, between Montgomery and Sansome streets, San Francisco, California. no21

Nevada County Gold Mining Company, Nevada County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of October, A. D. 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Wm B Peake	425 to 450 inc.	26	$26 00
Wm B Peake	261 to 299 inc.	39	39 00
Wm B Peake	300 to 315 inc. 341 to 350 inc.	25	26 00
Unknown	141 to 245 inc.	107	107 00
Unknown	257 to 260 inc.	4	4 00
Unknown	356 to 408 inc.	53	53 00
Unknown	471 to 500 inc.	30	30 00
Unknown	91, 93, 420, 462	4	4 00

And in accordance with law, and an order of the Board of Trustees, made on the fifth day of October, A. D. 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 9 Merchants' Exchange, San Francisco, Cal., on Saturday, the twenty-sixth day of December, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. AUG. KNAPP, Secretary.
Office, No. 9 Merchants' Exchange, California street, San Francisco. no28

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the thirteenth day of October, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Bradley M	old issue	7	50	$00 00
Bradley, A B	old issue	56	5	10 00
Ely, L	old issue	47	10	20 00
Findley, Thos	new issue	26	49	98 00
Gray, C M	old issue	5	30	60 00
Gray, C M	old issue	6	30	60 00
Earle, F	new issue	10	25	50 00
Kitchi, D E	old issue	30	54	108 00
Lawson, J F	old issue	44	49	98 00
Lamory, E	new issue	11	100	200 00
Ruggles, D W	old issue	37	10	20 00
Van Muller, E		20	150	300 00
Van Muller, E		21	100	200 00
Van Muller, E		22	50	100 00
Van Muller, E		23	25	50 00
Van Muller, E		24	20	40 00
Vitte, I		25	5	10 00

And in accordance with law, and an order of the Board of Trustees, made on the thirteenth day of October, 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salerooms of J. Middleton & Son, 310 Montgomery street, San Francisco, on Monday, the seventh day of December, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOUSE, Secretary.
Office, 318 California street, San Francisco, Cal. no21

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of October, 1868, an assessment of one dollar ($1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 87 Stevenson street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of November, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighth day of December, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

P. CARROLL, Secretary.
Office, No. 87 Stevenson street, between First and Second streets, San Francisco. oc24

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Saturday, the twenty-eighth day of November, 1868, and the sale thereof until Thursday, the seventeenth day of December, 1868. By order of the Board of Trustees.

n21 P. CARROLL, Secretary.

San Francisco and Castle Dome Mining Company. Location of Works: Castle Dome County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of November, 1868, an assessment of three cents per share was levied upon the capital stock of said Company, payable immediately, at the office of the Treasurer, A. L. Gladding, No. 420 Montgomery street, San Francisco, in United States gold and silver coin.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of December, 1868 shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twelfth day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. R. SMITH, Secretary.
Office, No. 423 California street, 3d floor, San Francisco no28

U. S. Grant Mining Company.—Location of Works: Carlisle, Nevada County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of November, 1868, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 226 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of December, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the second day of January, 1869, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

ENOS TAYLOR, Secretary.
Office, No. 226 Clay street, San Francisco. nov14

Machinery.

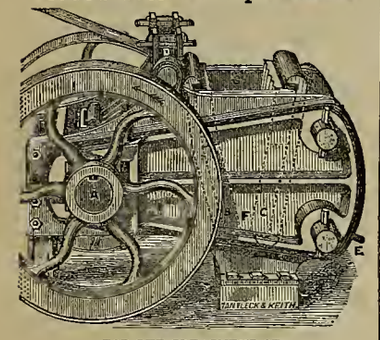
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store, No. 1 Clay street, below Davis

Fire, Hose and Machine Belting.

THE SUBSCRIBER CONTINUES TO MANUFACTURE Oak Tanned Leather Fire Hose, warranted superior to Eastern Hose, manufactured at the Sixth Street Tannery, San Francisco.

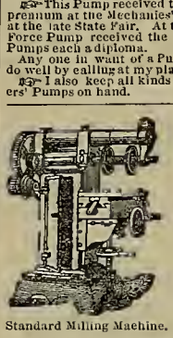
HYDROSTATIC WORKS.

SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.



I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Baden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN GATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞ This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞ I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

COLORADO MINING.—Prof. Silliman, who recently returned from Colorado, made the following remarks before the Connecticut Academy of Arts and Sciences: "Colorado is a mining country cursed by "processes." Mills are found in abundance filled with all manner of useless machinery, invented and constructed by men who knew nothing of the problem to be solved. In one notable case the Lyon process of lead liquation was adopted, when there was no lead in the region; and as a result, $2,500,000 of the $5,000,000 capital of the Consolidated Gregory have been sunk there, the furnace not being worth the bricks used in its construction. Now, however, the common sense of mining managers is returning, the old and proved methods have been adopted, and the yield is increasing. Nevertheless, the stamps there are badly managed, and the methods of amalgamation are far poorer than in California. Prof. Hill is running copper furnaces which produce a regulus containing 50 per cent. of metal (copper carrying the gold and silver) which is shipped to Swansea to be parted. As soon, however, as enough can be furnished, it will be parted there; though no idea of the richness of the country is given by the fact that there is not at present enough first class ore produced to support more than one furnace. The miners are finding out that it is better for them to sell their ores for cash than to attempt to handle them themselves. They bring them to Prof. Hill, who assays them and pays them cash each on the same day, for the gold only, the copper being a perquisite of the mill. Near Georgetown a mill costing $50,000, with no mine to give it ore. Likewise another mill not far away, which cost half a million of dollars, and in which the inventor proposed to extract gold by steaming the fine ores with sage brush! But the most mortifying feature was to find, after the mill was completed, that their vein was argentiferous galena and contained no gold. More of these lamentable failures may be seen in one day in Colorado than can be found in a year in any other mining region."

RATIONALE OF PERPETUAL MOTION.—Perpetual motion, in the true sense of the term, is the law of the universe. The forces of nature are eternally inter-acting, and no atom of force can be annihilated, but only changes its mode of operation. The heat which proceeds from the sun can never be lost or finally expended; but whether it is wrapped up in the flora and fauna of the earth, or is seized hy man and adapted to his ends as a mechanical agent in the steam engine or the lathe, it remains, under all its varying conditions, the same amount of force, in its primal qualities and quantities unchanged and unchangeable. The recent discovery that the various other forms of force have each its exact equivalents in mechanical units, and that the conversion of force either way is by equivalents, sets this question of perpetual motion at rest, and shows that the law of equality of action and reaction, is to be extended from simple mechanics to all moving agencies in nature. Thus it has become a sure axiom of science that there can be no self-impelled mechanism of human production, and that the idea of perpetual motion is a mischievous chimera, the pursuit of which can only terminate in mortification, failure, and loss of time and money.—*S. F. Times.*

THE NEW OXYGEN LIGHT.—This light is to be introduced into New York. A large laboratory, 200 feet loug and 100 wide, is to be erected for the manufacture of the oxygen, which is to be mixed with the ordinary street gas. It will for the present be conveyed in portable vessels to those buildings where it may be desired; and it is expected that ultimately pipes will be laid especially for it. It is said that actual demonstration has proved it to give a light 19½ times more brilliant than the gas made by the Manhattan Gas Co., at about one-third the cost.

THE ICE TRADE.—The London *Times* says: During the present season Paris has been largely supplied with glacier ice from Switzerland. This is a great innovation and possibly will produce a great revolution in the ice trade. The desert mountain peaks, glittering in the sun on many an Alp, hitherto valuable only in a pictorial point of view, may come to be commercially valuable. When that day arrives, good-bye to the picturesque in one form at least; it will be sledged away to cool the palates of the snug citizens in the continental capitals.

THE NEW POSTAGE STAMPS.—The new stamps are delicate and elegant engravings, slightly smaller than the present ones. The *two-cent* stamp represents a primitive mail carrier on horseback, such as is still necessary among the sparse populations of the West. The *three-cent* stamp shows a mail train, as illustrating the land service. The *twelve-cent* denomination exhibits a steamer at sea, as an exemplification of the ocean mail. The *five-cent* stamps bear a miniature of Washington, being an accurate copy of the face of the "Father of his Country," as shown in Stuart's picture at the White House. The *ten* and *thirty-cent* stamps are real gems; the former represents a *petite* copy of Trumbull's painting of the "Signing of the Declaration of Independence," and the latter exhibits his "Surrender at Yorktown," both taken from the pictures at the National Capitol.—*American Artisan.*

RUTHENIUM.—This is a rare metal, at present of no practical value in the arts. It occurs in platinum ores and in the native osmide of indium; the latter containing from three to six per cent. of it. In appearance ruthenium is of blackish-gray color, and somewhat resembles indium; it is very brittle and is one of the most infusible of the metals; the flame of the oxy-hydrogen blow-pipe does not fuse it, and aqua-regia scarcely attacks it. Its affinity for oxygen is greater than any of the platinum metals, except osmium. When heated to redness in the air, it oxidizes and forms a bluish-black oxide, which does not part with its oxygen at a white heat.

FUEL-LOADING SHUTE.—At one end of the shute for supplying the engines on the Lebanon Valley (Pa.) Railroad with fuel, is a house containing a stationary engine which works a set of pumps. These force water out of a cisteru into a cylinder head containing a piston of some twenty feet in length and six inches in diameter. The piston works perpendicularly, and on the end of it rests a platform on which one eight-wheel, or two four-wheel coal cars are placed from the siding. The pumps are put in motion, and in two minutes the loaded cars, weighing about twenty-one tons, are raised aloft twenty feet, where the cars are pushed forward over the shute and dumped.—*Reading Eagle.*

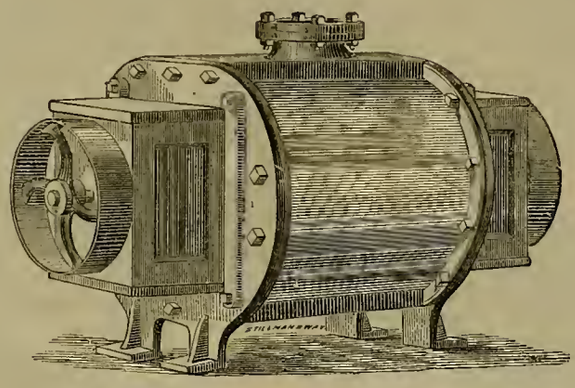
THE HOOSAC TUNNEL.—Work upon this tunnel has been suspended. The *American Railway Times*, of Oct. 3d, says: "This order is issued probably in consequence of the failure to secure bids of a satisfactory character for the entire construction of the tunnel according to legislation of the current year. There were several bids, but as the firm of contractors making the lowest bid did not or could not make the deposit required, as a satisfactory guarantee, the Governor and Council refused to conclude the contract."

DOUBLE PROPELLERS.—The latest marine contrivance is the propeller about being introduced by the French Transatlantic Company; instead of a single screw resting on the keel of the ship there are two screws placed on each side of the stem with the rudder between. It is claimed that the new arrangement will increase speed, work more easily, produce less strain and wear on the vessel, and give a new impulse to the movement by which propellers are slowly crowding side wheels from the ocean.

TELESCOPE CANE.—A physician in Concord, N. H., has a wonderful cane. It is so arranged as to combine a walking stick, a thirty-inch telescope, and a nice opera glass, and all perfectly free from dust. It is easily and readily adjusted for either purpose, and was patented on the 28th of last July.

FELT ARMOR.—An Italian named Muratori, has invented a kind of felt, made of vegetable substances, which is tough enough to turn a rifle ball. He proposes to dress soldiers in it for battle, and Napoleon III thinks of employing it instead of iron, for the armor of ships.

HANDY ANDY.—C. M. Leland, of Colorado, has filed a caveat to patent an instrument consisting of a combination of tools, which he calls "Handy Andy." It consists of a screw-driver, hatchet, hammer, wrench, claw, for drawing nails, and pinchers, all in one instrument.



AN agricultural locomotive, weighing 6,000 to 7,000 pounds, is rapidly approaching completion at Locher's machine shop in Oroville.

CALIFORNIA
BUSINESS UNIVERSITY

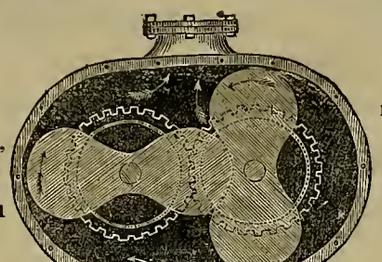
Full particulars regarding our Practical Course of Studies may be had by calling at the University, or by addressing
17v17-qy12p E. P. HEALD, San Francisco.



ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

Eley's Ammunition.

The Cartridges are made in three sizes, viz., .577 (or Snider Enfield) bore; .500 (or half inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES, .45 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 m., 9 m. and 7 m. bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps, Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

AUTOMATIC STOP-COCK FOR GAS-BURNERS.—The *Alta* speaks as follows of a patent recently allowed through the agency of this office:

We have been shown, by Geo. E. Smith, a practical jeweler of this city, an nttachment for an ordinary gas-burner, which is designed to save life, by making an escape of gas an impossibility. He has just received a patent on this invention. The apparatus is quite simple and certain in its operations. A bar of metal, either iron or brass, is fixed in such a position that it is kept hot as long as the gas is burning. As the light is blown out or shut off, intentionally or by accident, the contraction of the metal by cooling shortens to such an extent that it detaches itself from the valve or cut-off, which closes at once with a spring and prevents all further escape of gas. In bed-rooms, at hotels and other places, this inventiou would be invaluable, as it would make such nn accident as resulted in loss of life at the Brooklyn Hotel, a few weeks since, impossible. If the light is blown out, the gas cannot run more than fifteen seconds at the utmost, before the spring is detached and the orifice closed.

WOONWARD'S GARDENS.—The attractions at this delightful place of resort continue to draw large numbers to enjoy them. The zoological and botanical departments are superior to anything to be found this side of the Rocky mountains.

A New Treatise on Concentration of All Kinds of Ores.

INCLUDING THE CHLORINATION PROCESS FOR Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores Generally, by GUIDO KUSTEL, M. E. & M., author of Nevada and California Processes of Silver and Gold Extraction—120 lithographic diagrams.

OPINIONS OF THE PRESS.

KUSTEL'S NEW WORK.—Mr. Guido Kustel has just put forth anothor volume, a copy of which we have received from the publishers, Dewey & Co., San Francisco. The book contains 120 diagrams on seven plates. In issuing the work, the design of the author appears to have been to exhibit the present state of the art of concentrating ores as practiced in the older and more experienced mining sections of the world, as well as in the moro recent mining operations in California. The principles on which the system of concentration is founded are stated without entering into scientific reasons.

The dressing of ores is treated at great length, and the plan is based on these principles: "1st. Each constituent of tho mass of ore must be brought to the highest value which can advantageously be given to it. 2d. The useful minerals must be concentrated only to the most advantageous degree of purity; and, 3d. All loss of the quantity and value of the useful mineral must be avoided as far as practicable." Reduction in its diversified modes—by rock-breakers, stamps, rolling mills, and grinding in arastras, pulverizers, Cbili mills and pans—necessarily occupies large space by reason of its importance.

The plan of reducing ores by stamps, in either the wet or dry process, forms a complete treatise of itself, and may be studied with advantage by all persons connected with reduction works of that character. Concentration of gold ores is specially treated in section 49, and of silver ores in section 50. The latter subject should possess interest for our millmen and miners, as the plan of concentrating ores is certain to be resorted to as soon as the business is understood and reduced to a system.

The sections of the work devoted to tho extraction of gold from sulphurets, arseniurets, or quartz, by chlorination, are based on Plattner's process of the property of chlorine gas to transform metallic gold into soluble chloride of gold. By this process it has been demonstrated that gold is extracted perfectly. Our author says the process was first introduced into Nevada, California, in 1858, whcro there aue several establishments in successful operation.

The process of chlorination is described in the fullest manner, and embraces a particular description of the various roasting furnaces in use, as well as of the operation of roasting.

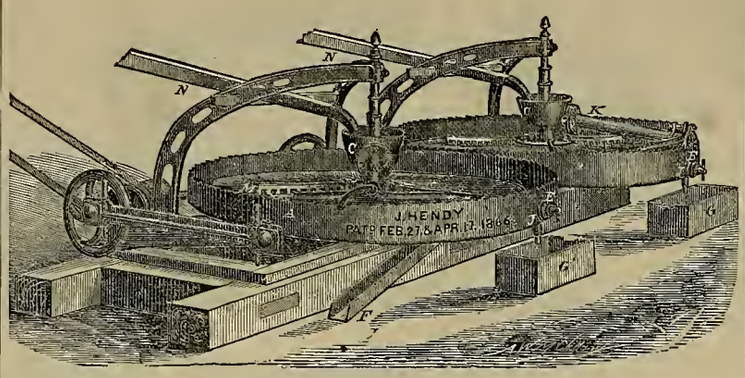
We commend Mr. Kustel's treatise to the attention of all concerned in the business of mining and reducing ores, to whom it must prove a valuable hand-book of practical knowledge.—*Daily Reese River Reveille, Jan.*, 1868.

Price of the work, $7.50. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS, San Francisco, who will supply orders, by mail or express, at wholesale or retail.

IMPORTANT TO LUMBERMEN.

ANDERSON'S
Patent Muley Saw Hangings.

These Mulays will cut FIFTY PER CENT. MORE LUMBER PER DAY than any other Mulay in use, with fifty per cent. less power. They are very durable, and easily kept in order, and warranted to give satisfaction. No Mulay Mill should be without them, as they will pay for themselves in a very short time. No other mode of manufacturing Lumber can compete with the Muley Saw with this improvement. Send for circular. FULLER & CO.,
Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m



PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.

A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seen in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.

13v17tf

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION PATENT

Variety Molding and Planing MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLET OOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,
Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pin dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.
Address P. O. box 17. 23v17tf

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

AMERICAN

(WALTHAM)

WATCHES,

THE BEST:

THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent payable in gold.

A profit of at least twenty-five per cent to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first class dealers in the United States and British Provinces.

Sheffield Scientific School
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

AGENTS WANTED FOR
SUNSHINE AND SHADOW IN NEW YORK
Matthew Hale Smith's New Book.

This is the most popular work ever introduced on the Pacific Coast. It outsells every other publication.

Agents report from 50 to 150 subscribers per week. If you wish to know how fortunes are made and lost in a day; how shrewd men are ruined in Wall street; how countrymen are swindled by sharpers; how ministers and merchants are black-mailed; how gambling houses and lotteries are conducted, read SUNSHINE AND SHADOW IN NEW YORK, and learn about New York bankers, merchants, brokers, editors, police, military, detectives, gift swindlers, pickpockets, etc., with biographical sketches of all the prominent men in the great metropolis.

Agents desiring territory for this rapidly selling book should apply immediately to R. J. TRUMBULL & CO.,
20v17tf1pm 425 Montgomery street, Room No. 5.

New Incorporations.

Geological Philosophy.

The following poem, by W. A. Kendall (of this State), is a gem that will certainly please and instruct every reader of the PRESS. It is the far-reaching philosophy attaching to geology that makes its pursuit so interesting, and its deductions so profoundly suggestive. Kendall heads it

TERRAQUEOUS.

[From "Ansted's Great Stone Book."]

FIRST PERION.

Bare rocks and vacuous water—
Liquid and solid wastes alternate span
Primeval Earth about—
No Plant, no Beast, no Man.

SECONN PERION.

Cycles of unrecorded time—
Slow transmutations, vast upheavals, shocks:
Dawning of vegetable life—
Lichens upon the rocks.

THIRD PERION.

Centuries of rain and sunshine—
Fins flash the ocean depths, the land
Teems with crude animation—
Brutes wallow on the sand.

FOURTH PERION.

More sluggish centuries lapse—
Forests surmount the hills—umbrageous gloom:
Incense exhales and melodies are piped—
Birds twitter—flowers bloom.

FIFTH PERION.

The age of final preparation wanes—
Declared the consummation of the Plan:
The House is ready—lo, its master comes—
The "Jack of all Trades"- Man!

* * * * * *

A link discovered wanting—
A section to complete the circlet human;
The Man is *less* a rib, and straightway finds
Himself—*plus* Woman!

SIXTH PERION.

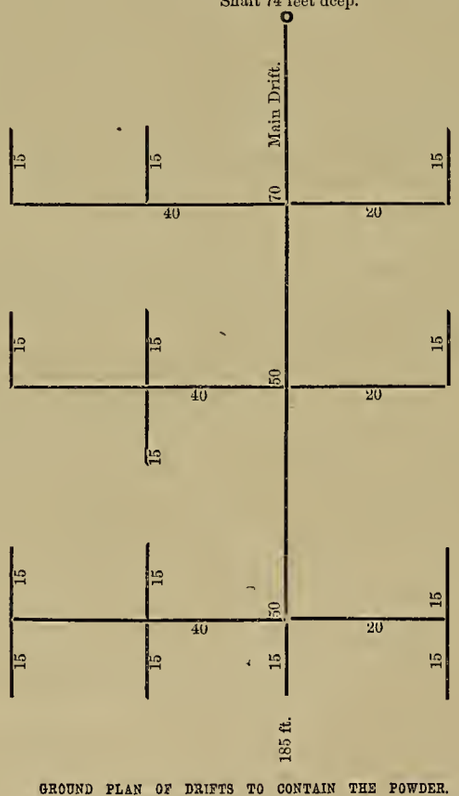
Generations of masters come and go—
The house absorbs its tenants—all is mystery:
Reason toddles a-pace, babbles, and founds
Traditional History.

SEVENTH PERION.

Inventions and contentions—
Wars, famines, feasts, and plagues;
Prophets and puppets; crucifixions, trinkets—
Reformers on bow-legs.

Not yet the end—perhaps not yet the middle—
Uncertainty its fullness still retains;
Yet, for their derivation—*stone* and *water*—
How wonderful are brains!

THE LARGEST LOCOMOTIVE.—A correspondent of the *American Artisan* says: "The 'Reuben Wells'—a locomotive built at Jeffersonville, Ind., for the J. M. and I. R. R., to be used on the 'plane' at this city (Madison)—has ten driving-wheels and weighs *sixty-five* tons. This is the largest locomotive in the United States, and runs on the steepest grade in the world, I believe, the rise being 400 feet to the mile."



A Great Blast in the Gravel Mines.

It cannot be gainsaid that the Pacific Coast has contributed to the world, besides its pyramids of gold and silver, also a material addition, in several not unimportant particulars, to its previous acquirements in the arts of mining and civil engineering, and in metallurgy. Gold and silver, we are almost ready to maintain, are the veritable component metals of that lever with which Archimides proposed to move the world,—we are not sure that even any place is needed to stand upon. To build the Pacific Railroad over the lofty and snowy Sierra Nevada, was no great matter at all to the stake-hold, practical engineering mind of Californians; yet it is the most meritorious work of the kind, if we have not been over-praised, that the world has seen.

Hydraulic mining engineering is, to Eastern and European miners, engineers and geologists, an unrealized fact; or if presented to them in tangible hights, distances and quantities, a myth,—so far removed from them and their surroundings, that it matters not to them whether it be true or false. That the gravel miners of California are digging away miles of hill and mountain to a depth of 200 feet or more, and depositing them in Sacramento Valley, from ten to thirty miles distant, can be best believed when seen. But it is nothing for self-glorification. Gold is there, and the mountains must come down,—if it takes a hundred years to sweep them away to the clean bedrock. The elements do it, and man controls the elements, as it is his privilege to do.

An idea can be formed of the dimensions of some of the large blasts which are set off to loosen up the hills for the operation of the hydraulic stream, from the following communication:

EDITORS MINING AND SCIENTIFIC PRESS: Learning from paragraphs in the papers of the day that a great blast was to be exploded in the mines at Smartsville about the 15th of the month, I took a stroll to the place, to examine the preparations.

GROUND PLAN OF DRIFTS TO CONTAIN THE POWDER.

I found that it was proposed to burn 1,200 kegs, or fifteen tons, of powder in one blast.

To understand the nature of the ground to be blasted, place yourself on the side of a mountain rising on an angle of about twenty-five degrees. There is no opening to start from; and to get to the level of the flume through which the earth is to be washed after the explosion, a shaft is sunk at the head of the flume seventy-four feet in depth, and inclines are run out north and south from the bottom of shaft, for the purpose of washing the gravel into and through the flume.

From the bottom of this shaft a drift three by four feet is run into or under the mountain a distance of 185 feet, the surface of the mountain being at this point 105 feet above the drift. Then, seventy feet from the shaft, there is a cross drift of forty feet in length from the main drift south; then, at a distance of twenty feet from the main drift, on this side of the drift, a second side drift is run back fifteen feet towards the mouth of the tunnel; then, at the end of the forty feet, another drift is run fifteen feet towards the mouth of tunnel, and directly opposite this side drift of forty feet south there is another side drift south twenty feet, at the end of which a drift is run fifteen feet towards the mouth of the drift on this side—forming an L, and on the other side a double L. Then, fifty feet further under the mountain, the main drift is cross-drifted as before. Then, fifty feet further in, the main drift is crossed again as before, only the cross drift of forty feet is crossed each way, forming a double T; the opposite side the same. In these cross-drifts the kegs of powder will be stored, with only the heads broken in. The wires from the battery will pass through one or more kegs of powder in each cross drift, thus igniting the whole mass at the same instant. The main drift will be tamped from bottom of shaft to the first cross drift, a distance of seventy feet. In the remainder of the drifts, nothing but the powder is placed, leaving a large vacuum, where the force of the powder is collected before it begins its work.

This is the largest blast that has ever been attempted in the mines of this State. I will try and be present when it is discharged, and will send you an account of the result. Yours, A.

Smartsville, Dec. 8th, 1868.

QUARTZ MILL STOLEN.—The Humboldt *Register*, of Nov. 28th, gives an account, and discourses as follows, concerning the stealing of a quartz mill from Vicksburg District, Nevada, near the Oregon line:

The mill was built by a party of adventurous miners, who failed, and the property was sold for delinquent taxes. An enterprising Humboldter bought it, and considering it perfectly safe where it was, albeit it was in the Indian country, left it alone in its glory, until such time as he could find employment for it. While resting in fancied security, some equally enterprising farmers from Surprise Valley, in California, went to Vicksburgh District and "snaked" the mill over to Surprise, and put it to crushing grain. People who have gold filing in their teeth, or hot stoves, or post-holes for fencing out that way, will do well to keep a sharp lookout. There would be no use in a blind hog of the female persuasion hoarding up acorns for winter in that section of the country. The fellow who stole the blankets and east-off clothing of the Santa Cruz Small-pox Hospital, recently, will find a colony of his countrymen in Surprise Valley.

GERMAN WHALING GUN.—Mr. Rechten, of Bremen, has been exhibiting the newly patented German whaling gun at New Bedford. The gun is double and very heavy, mounted on trunnions. One barrel is designed for a harpoon and the other for a bomb lance. The harpoon is said to have been thrown a long distance with great accuracy.

What May Happen in Africa.

Simultaneously with the announcement that Livingstone is approaching the Zanzibar Coast, we have another, that immense and very rich gold fields have been discovered in South Africa. Grand expectations are predicted on the explorations of the great traveller, which have just been brought to a close, and from the development of the auriferous region about to commence. A mining fever has broke out, as it did in California and in Australia, and already a swelling tide of emigration has set toward the inviting placers. So far the movement has been attended by all the manifestations which so peculiarly distinguished the migrations to the Pacific slope and to the ocean isle. Transportation from Cape Town to the diggings, by every means of conveyance, is eagerly sought, and is procurable only at the most exorbitant charges. This has led to the formation of a company to furnish a regular intercommunication for passengers at reasonable rates. Thus does the frontier of civilization in Africa, which heretofore has clung to the coasts, threaten to extend more than a thousand miles into the interior from the southern extremity, and three or four hundred miles west of the eastern shore.

A vast foreign population suddenly transferred to the central wilds of the great continent which has been almost a sealed book for so many ages, with all the accessories, pursuits, habits and ambitions of civilized life, cannot but leave a permanent impress upon the country, and to lead to the most wonderful realizations. Thousands and thousands of European and American inhabitants cannot be brought together without causing utilitarian development on a cyclopean scale. A village of bush arbors adjaceut to a gold gulch would not long remain without undergoing the changes of a transformation scene, ending in an array of pretentious buildings, and a community subjected to some sort of municipal government. Let mining prove a remunerative operation, and the growth would be steady and rapid. Newspapers would become indispensable, and the demand would soon be abundantly supplied. Just imagine the fact of regular journalistic advices from the interior of Africa!

As the country filled up with gold hunters and other adventurers, and as the auriferous product found its way into the world's markets, lines of steamers from several important ports would connect with the coast of Africa. Any considerable continuance of such a state of things could not fail to plant the germs of enduring government amid the wilds of the mining region. Being the outgrowth of fortuitous circumstances, and surrounded by all the elements of democratic equality, the natural tendency would be to the formation of a republican organism. Monarchical institutions could scarcely arise out of a community of interests so suddenly created, causing so speedy a necessity for a scheme of polity.

It is almost needless to promise that adventurous explorations would soon begin to diverge in many directions from the center of population, resulting in a multitude of valuable and curious discoveries, leading to a topographical description of distant regions, and adding much information to our scant knowledge of interior Africa.

Who can tell what revealments might not be made, or what new influences might not be set at work upon the world's progress? The central wilds of that vast continent are as little known to civilized man as was the Mississippi Valley when our forefathers were fighting for civil and political liberty. Since then every acre of the valley's soil has become a familiar spot, and it promises, at no far distant day, to be the seat of commercial empire, and the center of population in North America. The obscurity and solitude which now envelop the interior of Africa, are not, therefore, to be estimated as very serious obstacles in its speedy development, should not other conditions intervene.

The gold discoveries of California were the efficient instruments of building up that territory to the stature of a full grown State within two years. Pour a steady stream of immigration into the mining regions of interior Africa, and similar manifestations might reasonably be expected. Such a contingency affords groundwork for many curious speculations about the resulting influences upon migration, upon commerce, upon gold value, and upon the future status of Africa itself.—*Chicago Republican.*

White Gunpowder is made of the following ingredients, which are pulverized separately and then mixed with a spatula or by sifting many times: Chlorate of potash, 48 parts, yellow prussiate of potash (dry) 28 parts, sugar (dry) 23 parts.

The Dearth of Invention.—When the grandfather of our queen ascended the throne in 1760, there were no steam engines as we now understand the term. Even Adam Smith, who wrote so profoundly and so prophetically upon the wealth of nations, did not live to see a puddling furnace or a rolling mill, nor did Dr. Darwin survive to see a power loom, nor did Pitt or Fox, although both died less than a full lifetime ago, ever hold a steam-printed sheet in their hands. It is not yet fifty years since the death of Watt, yet he saw but the dawn of steam navigation, and Sir Humphrey Davy passed away before there were such things as railways, the self-acting spinning mule, or the hot blast. To Telford's latest days there was neither ocean steam navigation, electric telegraphs, nor photography; and it is too recently for any reference to living memory, that we have had the india-rubber manufacture, the discovery of anæsthetics, screw propulsion, wrought iron bridges, iron ship-building, the coal oil manufacture, submarine telegraphs, the Bessemer process, steam cultivation, and a host of inventions and discoveries of less, yet remarkable importance. But the stimulus of invention is just now wanting; there is a languor of practical inquiry, and we appear, indeed, to have but few subjects for practical discussion. Whoever would set going ideas of practical promise now would render a great service to us all. We have well nigh worked out the questions which so occupied the profession but a few years ago. There is little said now about high pressure steam, high piston speed, surface condensation, superheating; about sizes, forms, or proportions of ships, about locomotives or railway construction, about ordnance and armor, steam plowing or gas making, about bridges, foundations, waterworks and pumping machinery, and a dozen other topics upon which, so lately, there was so much difference of opinion. There are subjects left for discussion, but we hear little of them. Of these are steam-worked tramways, the disposal of sewage, the use of liquid fuel, hydraulic propulsion, artificial stone, etc., to say nothing of aërial locomotion. More power to the elbow of every one who has undertaken to advance these ideas; more *nous* to those who will undertake to give us new ones. We are all stagnating as we are, and only a new invention, or a new idea of practical applicability, will give us fresh life.

Which shall be the Greatest.—Besides minerals, there are three or four productive interests in this State, for each of which some one, in imitation of a well-known phrase, makes a claim to be "king." Wheat, in fact, is the only interest that could make such a boast with any show of truth. The others, as yet, are only aspirants for the honor. The people of Napa, Sonoma and Los Angeles, claim that the grape shall be king. Prevost, of San José, Messrs. Haynie & Hoag, of Sacramento, and Muller, of Nevada, claim that silk will take precedence of every other interest. If Flint, Bixby & Co. were asked, they would point to the green-hill pastures and to a flock of well-bred sheep, only exceeded in numbers by two others in the world, and argue that wool would some day be king. The fact is there will be no king. Wheat, wine, silk, wool, gold, silver, and even other mineral and vegetable productions, will divide the honor among them. Some one interest will possibly take precedence over any other single interest, and assume a more important position in our export returns, but which it shall be who can tell? And what it may be is not important. No interest is ever likely to spring up in this State that will override any other two or three interests; certainly none can ever rise that will override in importance and exceed in amount the sum of all other exports when added together in one grand total. Neither wheat, wine, wool, silk, or precious metals will ever be king. There will be a commonwealth of commerce and home production, in which, though the individual elements may differ in consideration, none will assume to rule all others. The export trade will never be governed by a product that will style itself king, but will be ruled by the many after the manner of our own Republic.—*Bulletin.*

British Minerals Raised in 1867.—We extract the following figures from the "Mineral Statistics of the United Kingdom for 1867"—by Robert Hunt, F.R.S.:

	Tons.	Value.
Coal	104,500,480	£26,125,145
Iron Ore	10,021,058	3,210,098
Tin Ore	13,649	694,734
Copper Ore	153,544	699,693
Lead Ore	93,432	1,153,066
Zinc Ore	13,489	41,340

Patent Office People.

The father-in-law of your Senator, Henderson, Mr. Elisha Foot, seems to be handling the Patent Office with ability. It is the current belief in Washington that this department of the Government is not without corruption, but the agents and lawyers whose offices lie in the environs, and who are at the mercy of its examiners, are chary to speak, much of their bread and butter being bound up in the good will of the directory. A partial awarding of patents, in the interest of money instead of merit, involves unjust millions of dollars, besides discouraging inventors and making them doubt the righteousness of the Government. With a corrupt Patent Office, infinite law suits arise, and yet it is probable that money is freely used within the precincts of that building, the claims of inventors who are willing to pay being considered in many gross cases beyond those of the needy. So is their preference among the patent agents—those who solicit patents—some being understood to have the ears of the office at their disposal, others failing to secure patents which are afterwards willingly granted to cotemporaries.

Mrs. Foot, the wife of the Commissioner, is an inventor, whose patents have been profitable. She has invented a skate without straps, and several other things.

Thaddeus Hyatt, once incarcerated in the District jail for a complicity which he affected to have with John Brown's raid, is now a successful inventor, his patent for glass light in pavements netting him a very large income.

About 50,000 patents have been issued in the United States in thirty years, the receipts for which in fees have been nearly two millions and a half of dollars, while the British Government has granted only about 40,000 patents in 250 years. This shows the extraordinary activity of the American mind in mechanics, and the Patent Office building, which has cost the Government no money, is the best monument to American shrewdness and suggestiveness in the world. Amongst nearly a hundred thousand models stored in the galleries of that splendid institution, one may wonder in hopeless bewilderment, feeling that every model, however small, is the work of some patient year, lifetime. and often of many lifetimes—so that the entire contribution, if achieved by one mind, would have extended far into a human conception of an eternity of labor.

The best patent lawyers in the United States are Judge Curtis and Mr. Whiting, of Boston, Messrs. Gafford and Meller, of New York, George Harding, of Philadelphia, and Mr. Latrobe, of Baltimore. The practice of these will average $30,000 a year.

The Patent Office building is generally adjudged to be the most imposing of all the national edifices at the Capital. To my mind the Postoffice is a better adaptation. The former was the work of the present architect of the Capital, Edward Clark, and its three porticoes cost $75,000 apiece. The four grand galleries, or model rooms, are unlike and magnificent. It is related here that inventors who spend many years among these models commonly go crazy. Some day, at leisure, I will relate to you some striking contemporary incidents of minds out of gear. Within the Patent Office building are also maintained the Bureaus of Public Lands, Pensions, Indian Affairs and the Census. The Agricultural department has now its separate building on the hights near the Smithsonian.—*Washington Cor. Missouri Democrat.*

More Evidence Touching Pliocene Man in California.—The Amador *Ledger* of Nov. 28th contains the following, which is cumulative evidence of the genuineness of the Pliocene skull of Calaveras County, known to fame as the fossil Joe. Bowers:

Two or three years ago, John Dane, while running an open cut for mining purposes, through Grass Valley Ranch, in Amador County, unearthed the skeleton of a mastodon of huge proportions, but most of the bones crumbled to dust after a short exposure to the atmosphere. The remains were found lying in a strata of auriferous gravel, with about fourteen feet of alluvial soil over them; but the most remarkable feature in this discovery, was that of several stone mortars and pestles, unmistakably the work of human hands, found in the same strata, and in close proximity to the remains of the mastodon, evidently proving that a race of human beings inhabited the mountains of California, coëxistent with the mastodon. Mr. Dane has several of these stone mortars and pestles, together with some of the grinders of the huge animal, now in his possession.

Gold Quartz-Crushing in Mexico.—It has been lately ascertained that few countries contain greater and more extensive gold fields and veins than the southern portion of this Republic. Several Americans from California have been inspecting the States of Michoacan and Guerrero, and the great advantages to be found there are superior to California or Australia. Rivers crossing those States in all directions (by which water-power can be replaced for that of steam) are found in numbers; impenetrable forests on the hills, and agricultural produce of every class, and close at hand. As a general rule, 300 pounds of barley or Indian corn are sold for 8s. at the mineral districts. A common laborer is paid 1s. 6d. a day, and a skilled miner of the country 2s. and 2s. 6d. The same can be applied to another neighboring country—Nicaragua. And although the first English company for that country did not take full advantage of these circumstances, having sent persons to take charge of their property not sufficiently experienced in gold quartz-crushing, not having been sufficiently cautious as to taking average samples, gave these as having 20 ozs. to 25 ozs. of gold per ton, instead of 1 oz. to 1¾ oz., which is a good paying average on large quantities. This is shown by the monthly returns from the Port Phillip and Clunes of Australia, as also the Anglo-Brazilian companies, that pay, on an average, very high percentages, on ore that seldom yields above ½oz. of gold per ton. I imagine that, if these companies pay handsome dividends on ½ oz. per ton, with steam-power and high wages, Mexican gold mining companies, with much greater advantages, and an average of 2 ozs. per ton, cannot but promise a great future for such undertakings.—*London Mining Journal.*

Geology of Vancouver Island.—In the December number of the *London and Edinburgh Philosophical Magazine*, we find the following abstract of a communication from Hilary Bauerman, to the Geological Society of London:

"The author described, first, the metamorphic rocks which are everywhere seen in the neighborhood of Esquimalt and Victoria, principally dark green saudstones and shales, passing insensibly into serpentine, chlorite-schist, mica-slate, and gneiss. At some places unfossiliferous crystalline limestones are associated with them. Dykes of greenstone, syenite, porphyries and trap rocks frequently penetrate the methamorphic rocks. To the westward of Esquimalt black cherty limestones and red porphyry occur. To the north at Nanaimo, rocks with Cretaceous fossils appear, also at Cornoux Island, twenty-one miles northwest of Nanaimo. The fossils occur in nodules, and consist of fish scales, Nautilus, Ammonites, Baculites, Inoceramus, Astaste (?) and Terebratula. Lignitiferous deposits (sandstones, grits, conglomerates and micaceous flagstones) succeed the Cretaceous rocks, and are extensively developed over a great extent of country, forming the mass of the islands in the Gulf of Georgia as far south as Saturna Island. Northward, they occur at Fort Rupert. Two seams of coal, averaging six to eight feet each in thickness, occur in these beds, and are extensively worked for the supply of the steamers navigating between Victoria and the Frazer river. The coal is a soft black lignite, interspersed with small lenticular bands of crystalline coal. Retinite is common in more earthy portions. Shales, with plant-remains, are interstratified with the lignite. At Bellingham Bay on the mainland similar coal-bearing sandstones have been observed by the American geologists.

A pleistocene boulder clay is widely distributed over the southern part of Vancouver's Island, and the opposite coasts of the mainland and grooved along the shore; and so also is the rock surface beneath the drift, which at Esquimalt Harbor is about 20 feet thick, while it is much more at the Barracks, and more than 100 feet thick between Albert Head and Esquimalt.

The Mineral Wealth of Russia.—Large and most important discoveries of coal have been made in Russia. The mines of one district alone are, according to the St. Petersburg journal *Golos*, capable of supplying annually 400,000 tons for 150 to 200 years. Since 1864 there have been surveyed in the valley of the Don forty-four beds, the aggregate quantity of which is estimated at 1,234,946,375,000 pounds, or more than 18,000,000,000 tons. The *Golos* asserts that the mineral wealth of Russia far exceeds that of England, and at the same rate of production would last for two centuries after the English mines were exhausted.

Mechanical.

Boiler Explosions.—Mr. Heaffman, of Breslau, publishes a description of some experiments recently made in accordance with the request of the Association of German Engineers. He used a small glass boiler, and found that when the escape pipes were only gradually opened, and the steam allowed gradually to escape, the generation of steam quietly continues, and the water remains pretty tranquil. But if, on the contrary, the valve is quickly opened, steam bubbles suddenly form all through the water, and rising to the surface place the water in violent commotion. In one of these experiments he watched the manometer, while another man quickly opened the valve to allow the steam to escape. As soon as the valve was opened the pressure fell three pounds, but immediately again began to rise, whereupon the boiler exploded. Where it had been in contact with the water it was shattered to powder, which lay around like fine sand. Of the entire boiler only a few small pieces, of the size of a thaler, were left. Afterwards he constructed a similar glass boiler, with a cylinder seven inches diameter nine inches long, and to the ends metal bottoms were placed by means of vulcanization; in the ends were pipes for letting in the steam. By means of a force-pump the boiler was filled with boiling hot water, the valve being left open meanwhile, in order that its sides might become evenly heated. Then half the water was drawn off again, and air let in, and then more boiling water forced in, so that the air was compressed until the boiler exploded, at a pressure of fifteen atmospheres. The report was not nearly so loud as at the former explosion, which took place at a pressure of only three atmospheres, and the glass only broken into several pieces. This clearly proves that the action of the water on the boiler is the same as would be produced by exploding nitroglycerine in the water. The effect is like an electric shock, and he is of the opinion that escape of electricity taking place during the issue of the steam is in play. If steam be led into cold water, shocks ensue that are capable of bursting pipes.

Bessemer Steel and Machine-puddled Iron.—The following is from an article in the *London Mining Journal*: "Although there seemed to be every prospect that machine-puddled iron would take as prominent a position in the market as Bessemer steel—yet the matter appears to have fallen into abeyance, whilst the manufacture of cheap steel is not only attracting more attention than formerly, but is actually causing the application of steel to many purposes for which, compared with good and cheap wrought iron, it is ill adapted. Chemists have endeavored to prove that the sole difference between pig iron, wrought iron, and steel, is in the varying quantity of carbon; but all who have been practically engaged in the handling of these metals, know that the difference depends more upon mechanical structure than upon chemical composition, and that, although experimental tests may appear to show that given samples of wrought iron and cast steel are of equal strength, it is found by experience that the two metals cannot in all cases be substituted for each other. For rails it can be understood that steel is as good or even better than iron, because a rail has to bear pressure and friction itself remaining in one position, and it would also have the advantage of resisting exposure to atmospheric changes better than iron, owing to its surface being more compact; but where a weight has to be supported by, and not upon, the metal, iron is to be preferred, because its structure is better able to bear the effect of tearing force. For this reason steel should never be employed in the construction of bridges, chains, or any like articles."

Lead Caulking for Boiler Man-holes. Mr. Heaffman describes the manner of making this, and recommends it: "A groove is cast into the lid of the man-way, ½ to ⅝ in. deep and wide, this filled with lead, which is well hammered down, and the surface thus formed is pressed to the rim of the man-way, whose edge must only be one line in width, and may be rather sharp. From the edge the surface of the rim falls away at an angle of 45°, thus forming an obtuse edge, which cuts into the lead. This easily-made caulking always fits closely and securely, if the lid is always placed as it lay at first."

Boring Machines at Mont Cenis.—The following description is from the London *Mining Journal*. Each machine is formed of a pair of bars, about six feet six inches long, these bars having placed between them the 3-inch cylinder by the piston of which the boring tool is actuated. The cylinder is not fixed to the frame bars, but is capable of sliding on them, motion being given to it by a large worm at its hind end, which gears into racks formed on the inner sides of the frame-bars. The cylinder is three inches in diameter, and its piston has a rod about two inches in diameter, there being thus but a comparatively small annular area on the front of the piston, on which the air continually presses. At the hind end of the frame-bars of the machine is placed a kind of miniature horizontal engine, worked by the compressed air—this engine driving, through a bevel gear, a square shaft, which extends nearly the whole length of the machine above the boring cylinder. This shaft carries a cam, which gives the necessary motion to the slide-valve, which governs the admission of the air to, and its release from, the boring cylinder; and from the same shaft the intermittent rotary motion is given to the tool, and also the necessary advance as the hole is bored.

Sanderson's Improvement in Steel and Iron Making.—Charles Sanderson, of Worksop, Eng., has obtained a patent for a process which is thus described by the London *Mining Journal*: "In this invention, the pig iron is melted on the bed of a furnace at a high heat, with the damper so regulated as to get the whole of the metal into a fluid state as soon as possible. Sulphate of iron is then charged in, and the iron rabbled, at the same time the puddler must draw the damper wide, and cause a current of air to pass through the furnace. The fire must also be pushed on, in order to greatly increase the heat. Whilst the metal boils violently the gas will liberate itself, and with it the phosphorus, sulphur, and other volatilizable and oxidizable impurities. By these impurities becoming oxidized, they will be brought into a gaseous state, and will by the strong draught be at once carried out of the furnace through the flue and up the chimney-stack, and in this way these gaseous impurities are got completely rid of out of the furnace, and cannot return."

Pennsylvania Iron Works.—We clip the following from the *Iron Age*, of Nov. 12th: On Monday, of last week, the largest amount of iron manufactured in any single bar mill in Pittsburgh or vicinity, in a single day's work, was made at the establishment of Messrs. Graff, Byers & Co., in East Birmingham. A wager was made by the foreman (Mr. Kramer), and the hands employed, that fifteen tons of four and three-quarter "hoop" iron could not be "turned out" in a single day's work, consisting of eight hours. At the expiration of the eighth hour it was found that 16¼ tons, or 36,400 pounds, were made (2,240 pounds constituting a ton.) Previous to this date the largest amount of work performed in any single mill was eleven tons, or 24,640 pounds. The famous "Iron Letter" which excited so much curiosity in England a few years ago, was manufactured at this establishment.

Heliographic Steel Engraving.—The *Artisan* describes some new and beautiful specimens of this art, which were executed by a New York Company. In this process the picture, a portrait, view, or subject of any kind, is obtained upon the steel plate by photography, the plate being so chemically prepared that when placed in the camera the picture is produced upon it by the action of light, in a manner somewhat the same as that in which daguerreotypes or ordinary photographic negatives are obtained, only the chemicals are made to act upon the steel itself and not merely upon a film or coating applied to it. The plate thus prepared is printed from in the same manner as an ordinary engraved steel plate. Engravings obtained in this way are of course absolutely accurate. The process is not only applicable to the production of pictures, but of plans, stock certificates, checks, etc., and all such subjects as are produced by ordinary engraving or lithography, while it is very economical.

The Largest Safe in the World.—The Philadelphia Safe Deposit Company has just set up the largest safe in the world. It is twenty-seven feet long, twenty-one feet broad, eight feet high, lined with the new "metal mirror" iron, which is five times harder than tempered steel, cutting glass like a diamond.—*Artisan, Nov.* 11.

Scientific Miscellany.

Super-Saturated Solutions.—C. Tomlinson, Esq., F. R. S., has shown that a highly super-saturated saline solution, which would separate at ordinary temperatures, may be cooled down to 10° Fah., or even lower, without such separation, if in a chemically clean vessel. The slightest particles of dust, however, will furnish a nucleus around which crystallization at once takes place, and the solution immediately becomes solid. Löwel was not successful in obtaining the same results,—not being able to reduce the temperature lower than 60°, without change. This was probably due to the fact that in his experiments he used *corks* as stoppers to his flasks. Under the operation of cooling, the partial vacuum created above the solution, would cause air to find its way in, bringing with it perhaps an infinitesimal particle of dust, which would serve as a nucleus. Mr. Tomlinson, on the other hand, used plugs of cotton wool as stoppers. This prevented the rarefaction of the air within, and also kept out the motes. A slight greasiness upon the finger, if conveyed to the upper part of the inside of the flask, also furnishes the chemically unclean condition under which crystallization takes place; this commencing the instant the flask is sufficiently inclined to allow the solution to touch the point to which the finger had been applied.

Aurine Cake.—Dr. Adriani details in the *Chemical News* some experiments with rosolic acid, or "aurine cake." This is a product of the oxidation of carbolic acid in the presence of alkalies. At the temperature of 60° Fah. it cakes together, and melts at 212°. Dr. A. did not succeed in preparing from this substance pigments for artists' use as oil paints,—which was the object with which his experiments were instituted. Although he obtained precipitates which, in the dry state, were of exceedingly brilliant and beautiful colors, all changed, when mixed with oil,—however clear,—to "indifferent shades of dark stone-red, somewhat similar to oxide-of-iron paint."

Dr. A. thinks, however, that it may be used as a red ink of great beauty, if dissolved in weak alkaline carbonates. Of these the best is the carbonate of soda. This ink does not corrode steel pens, but actually protects them from rust; mechanical draughtsmen can therefore safely use it with their steel drawing instruments. Moreover, any tampering with what is written with it, by acids, for instance, will be at once detected by its change to yellow; and the original color cannot be restored.

Fossil Imprints in the New Red Sandstone.—Mr. Daniel Jones, in writing to the *Wolverhampton Chronicle*, says: "It is so seldom that evidence of organic life during the period in which the new red sandstone was deposited is to be met with, that any such discovery deserves to be recorded; and for the information of geologists I am desirous of calling attention to four imprints of feet upon a large slab of sandstone now lying at the quarry, near Somerford. I was attracted by the very distinct ripple marks which may be seen on several slabs in the quarry, when I discovered the footprints upon the largest slab. I believe they will be recognized as similar to those observed at Hildburghausen, Saxony, of an unknown Batrachian, provisionally named Christherium.

Determination of Sulphur in Organic Compounds.—R. Otto heats the compounds with chromate of copper in a short combustion tube. It must be done slowly, and the front part of the tube heated just enough to prevent condensation of moisture. After cooling, the contents of the tube are "dissolved in chlorhydric acid, digested with alcohol, and after complete reduction, filtered and precipitated with baric chloride."

Chlorophyl.—We find the following in the Foreign Science summary of the *Chemical News:* In a note, entitled "Researches on Chlorophyl," by M. Filhol, presented to the Academy of Sciences, he states that all the methods of preparing chlorophyl requiring the aid of acids decompose this substance; and furnish, not chlorophyl, but the products which result from its decomposition. The organic acids, the action of which is less powerful, destroy the green color of solutions of chlorophyl; this substance splitting up into two substances, one of which separates in the solid state in the form of black flakes, while the other remains in solution, and is of a fine yellow color. The yellow matter, treated with concentrated hydrochloric acid, is separated into a solid substance which can be isolated by filtration, and which is yellow, and a blue substance which remains dissolved. The latter becomes yellow when the acid which has produced it is saturated. The yellow solid matter which separates when the hydrochloric determines the production of the blue color, contracts the property of becoming blue under the influence of acids, when boiled for a few minutes with potash, soda, or baryta, in contact with the air. The green parts of plants always contain, as well as chlorophyl, the two yellow substances spoken of.

Artificial Production of Iron Sulphides.—M. Sidot passed a current of dry sulphureted hygrogen over artificially prepared magnetic oxide of iron heated to bright redness. At first, aqueous vapor and sulphurous acid are disengaged; and at the end of about two hours, the whole of the oxide is transformed into sulphide in a state of perfect fusion. Upon raising the temperature, the evolution of sulphur vapors indicates the decomposition of this sulphide. After cooling, the porcelain tube which has been used for the operation is broken, and the cold part of it is found lined with fine crystals of modified hexagonal sulphide of iron, isomorphous with the protosulphides, and presenting their characters. It is not magnetic. The residue in the tube not sublimed is magnetic sulphide of iron. It is not only maguetic, but possessed of magnetic polarity.

Disinfecting Agents.—Dr. Berenger-Feraud, of the French navy, after trying wood charcoal, chlorine, chloride of lime, carbolic acid, and protosulphate of iron in deodorizing the bilge water of ships, comes to the conclusion that permanganate of potassa far exceeds them all in rapidity of action and thoroughness of effect, and says: "I made use of a solution of permanganate of potash, of the strength of half an ounce of crystals to a quart of water. One ounce and a half of this solution, added to a pint of foul bilge water, effectually removed all bad odor in three minutes. The action is so remarkable that its success in the disinfection of putrid matters of every kind may safely be assumed. It effectually destroys the foul odors arising from suppurations, and from putrefying and fæcal matters. Having one day imbued my hands with a concentrated solution of carbolic acid, I could not rid myself of the offensive smell. Repeated washings with soap, followed by applications of vinegar, chloride of lime and ammonia, failed. The idea occurred to dip my fingers in permanganate solution. The first application caused a notable diminution of the carbolic odor; after the third it had entirely gone." *Med. Press and Circular.*

Production of the Diamond.—M. Saix, in a memoir upon this subject, describes a process for the manufacture of diamonds, founded on the principle that a current of chlorine, or of hydrochloric acid gas, passing over fused cast-iron, forms perchloride or protocbloride of iron, both of which volatilize, leaving the carbon present in the mineral intact,—since the chlorine ought not to unite directly with the carbon. "The crystallization of the carbon could thus," he says, "be effected; for crystallization is produced in a solution of a substance susceptible of it when the solution is evaporated. The size of the crystals depends upon the slowness of the evaporation."

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to Dewey & Co., American and Foreign Patent Solicitors, and Publishers of the Mining and Scientific Press.

FOR THE WEEK ENDING NOVEMBER 17.

84,110.—Improvement in Hydrocarbon Burners.—John Gray, San Francisco, Cal.:

I claim the above described adjustable burner, consisting of the cylinder B, plug E, adjusting stem D, and openings *a a*, constructed and arranged substantially as described.

This invention relates to the construction of an improved petroleum burner, to be employed more especially in that class of apparatus where steam is generated by the use of either crude or refined petroleum, and it consists in a conical plug or button, around which the inflammable gas escapes from the retort and is spread so as to make a large heating surface. This plug is set into a cylindrical vessel or tube, and is attached to it by means of a stem extending through it and of a smaller diameter than the inside of the tube, to allow the free passage for the vapor on all sides. Openings are made in the tubes of such a form as to allow the vapor from the retort to enter it. The cone or plug is so constructed that it may be moved up or down to regulate the size of the passage, and thereby the size and extent of the flame.

84,125.—Improved Lemon Squeezer.—John Klepzig, San Francisco, Cal.:

I claim the movable button E, with its opening H, the spiral spring F, in combination with the two levers A and B, operating substantially as and for the purpose specified.

In one of the squeezing levers is placed a movable button, which is operated by a spiral spring. By placing the fruit between the two levers and closing them, the juice is expressed through the hole in the button into the tumbler, while the rind of the lemon is pressed closely against the face of the button-lever.

84,157.—Improved Mode of Fastening Straps to Boots.—Peter H. Baker, Virginia City, Nevada.

I claim the plate A, constructed as described, provided upon its outer edges with the long teeth *a*, and upon its inner edges opposite to each other with the short teeth *a*, said plate secured to the boot and strap by inserting the teeth and lapping the outer rows *a* over the inner rows *a*, upon each side of the frame as herein described, for the purpose specified.

84,168.—Contact Pad for Photographic Printing.—Joseph Buchtel, Portland, Multnomah County, Oregon:

I claim the use of the elastic pad *a*, filled with fluid air or gas; and also the eyelets *b*, with the attendant screws, together with the diaphragm *e*, substantially as set forth and for the purpose described.

84,224.—Improvement in Fire Arms.—Chas. Slotterback, San Francisco, Cal. (Antedated May 18th, 1868.)

I claim the combination and arrangement of plate (B), the springs (d), (i) and (l), trigger (k), sear (*g*), and hammer (f) when operated in the manner substantially as shown and described and for the purpose set forth.

RE-ISSUES.

3,200.—Improved Friction Pawl.—Joseph Moore, San Francisco, Cal. Patented May 7th, 1867.

What I claim as an improvement in hoisting apparatus is a pulley which shall be on one hand under the control of a brake bearing upon its outer surfaces and on the other hand connected with the shaft by the pawl and ratchet device, or its equivalent within the pulley, substantially in the manner and for the purposes set forth.

FOR THE WEEK ENDING NOVEMBER 24.

84,304.—Improvement in Anchors.—Carl Wilhelm Roëden, San Francisco, Cal.:

1. I claim an anchor constructed with its fluke-arms B, divided in two pieces and attached to the shank A, as described.

2. I claim the use of metal balls G, as a means of pivoting the arms on the shank, the whole as herein described and for the purposes set forth.

84,316. — Improvement in Carriage Springs.—Anson C. Stowe, San José, Cal.:

I claim the shafts E E, with their cranks or bent arms *d* and *g*, and the connecting rod *c*, together with the links *e e*, and rods *b*, the whole operating on the springs D, as an equalizing device, substantially as herein described.

The object of this invention is to so construct the two side springs of a carriage, that a weight placed upon any portion of the carriage will depress each side equally, and prevent the strain to the springs occasioned by the frequent wrenching they are subjected to in getting in and out of the carriage. The axle-bed and cross-bar of the carriage are connected by reaches, and have at their ends, suspended by shackles, semi-elliptic springs, upon which the body of the carriage rests. Two shafts extend across from one reach to the other, one near each end, each having three bent cranks, one in the center and one at each end, the middle ones being joined by a connecting rod. At each end of the carriage bed is a bar, which passes from one side to the other, both passing across on the same side of the shaft. The outside cranks of the two shafts are attached to the bars above by means of links, thus joining the whole together and causing the slightest weight on one side to be equally distributed, causing a like depression of the springs on both sides.

84,355.—Improvement in Pumps.—Thos. Hansbrow, Sacramento, Cal. Lucy A. Hansbrow and B. B. Redding, executors:

1. I claim the valves F, when their pivots *a* are adapted to fit in recesses formed in the walls of the valve chamber, whereby the heels of said valves have a vertical play while swinging upon said pivots, as herein described for the purpose specified.

2. The pump-barrel A, water-chest B, and valve chest, all cast in one piece, and arranged as described for the purpose specified.

PATENTS OF INTEREST TO THE PACIFIC COAST.

Issued October 13, 1868.

82,925.—Hydrocarbon Burner.—Sutton Edward Crow, Stratford, England. Patented in England, June 14th, 1867.

I claim arranging the apparatus in such manner that a jet or jets of steam under pressure (or, it may be of air) issues into the furnace in a direction parallel, to a pipe or passage by which combustible liquid is led into the furnace, such jet being immediately in rear of and below the mouth of such pipe or passage, substantially as described.

83,003. — Dumping Wagon.— George R. Sneath and C. H. Sneath, Wilmington, Del.

83,005. — Wagon and Car-unloader.—Noah Swickard, Galva, Ill.

83,066.—Fuel from Spent Tan-Bark.—Benjamin Irving, New York City.:

I claim the new manufacture of compressed fuel from spent or refuse tan-bark, by the method or process of forming it into blocks, or other suitable shapes, for fuel and transportation, substantially as herein before described.

83,079.—Baling Press.—John F. Milligan, St. Louis, Mo.

83,122.—Furnace for Roasting and Chloridizing Ores.—Henry Tindall, Chicago, Ill.:

I claim 1, A furnace for treating ores, in which the operation of desulphurizing and chloridizing or chlorinating such ores is performed simultaneously with the roasting of the same.

Issued October 27, 1868.

83,357.—Manufacture of Pigments from the Sulphurets of Zinc and Lead.—Nathan Bartlett, Centerville, N. J., Assignor to himself and Franklin Osgood, Richmond County, N. Y.

83,361.—Mill for Tempering Clay.—George Caruell, Samuel Williams and William Ellis, Philadelphia, Pa.

83,372.—Process for the Manufacture of Iodine.—Jules Fougerat and Lucien A. Tartiere, Quogne, N. Y., Assignors to "The Alga Chemical Works," New York City:

We claim, 1. Filtering the calcinized and boiled mussels, preparatory to their distillation, as set forth.

2. The application of peroxide of manganese to the making of iodine from mussels, as set forth.

3. The process herein specified of producing iodine from mussels.

83,389.—Apparatus for Making Extracts from Tan Bark.—Thomas W. Johnson, New York City.

83,533.—Apparatus for Preserving and Freezing Fish, Meats, etc.—Phillip Nunan, Sandusky, Ohio.

83,542.—Furnace for the Manufacture of Iron and Steel.—Augnste Ponsard, Paris, France.

83,547.—Road Grader.—James M. Ragsdale, McCoy's Station, Ind.

83,551.—Furnace for the Manufacture of Iron and for Other Purposes.—Henderson Ross, Pittsburg, Pa. (Antedated September 30th, 1868:

I claim so constructing the fire chamber of furnaces used in the manufacture of iron and steel, that the interior walls of said chamber shall consist of iron, which are surrounded with water, substantially as herein described, for the purpose set forth.

83,563.—Station Indicator.—Elihu Spencer, Ottawa, Canada.

83,577. — Combined Tools.— John D. Wilkinson and E. O. Boyle, Plattsburg, N. Y.

I claim, combining and securing or pivoting the wire gauge A, dividers C, rule D, square E, and calipers H and F together, when made to correspond in dimensions with each other, as and for the purpose set forth.

83,582.—Extracting Gold and Silver from their Ores.—John W. Kidwell, Washington, D. C.

I claim the use of finely divided iron, prepared according to Bischoff's patent process, in connection with the amalgamation of gold and silver ores, as herein described and set forth.

California Academy of Natural Sciences.

REGULAR MEETING.

Monday Evening, Dec. 7, 1868.

The Vice President, Dr. Cooper, in the Chair; eighteen members present. Elected Resident Members, Messrs. J. J. Owens and Emile Grisar.

Donations to Cabinet.—Two species of trilobite of Silurian age; one from Silver Peak, and one fifty miles S. E. of Eagan Cañon, near White Pine, Nevada. Presented by Mr. J. E. Clayton.

Two species of insect (name not given), from La Paz, by Oscar White.

The larvæ of a luminous insect, presented by Mr. Lorquin.

Specimens of the common *Malva rotundifolia*, the fibre of which is remarkably white and very strong. Specimens of cord made from it were also exhibited. Presented by Amos Bowman, on behalf of W. Frank Stewart, of San José.

Donations to Library.—Flore et Pomone De Java, par Madame Berthé Hoola Van Nooten. Deuxieme Ed. Large Folio, Illustrated, presented by J. B. Caldbach. Exposé Des Formations Quaternaires De La Suide par A. Erdmann, Stockholm, 1868. Atlas 4to and Texte 8vo.

Process Verb. Van de Gewone Vergaderingen der Koninklijke, Akadamie van Wetenschappen, 1866-7, 12mo. Jaarbock van de Koninklijke Akad. van Wet. 1866, 12mo. Verslagen En Mededeelingen der Konnink, etc., 1866, 12mo. Amste Annales des Sciences Naturelles, Zoölogie et Paleon, Paris, 1868. Archives du Musée Teyler, Vol. 1, pts. 1866-7-8; 8vo. Bulletin de La Societe Imperiale Des Naturalist de Moscow, 1867, 12mo.

Path of the Tatal Phase of the Solar Eclipse, Aug. 17-18, 1868, from Aden to Torres Straits.

Loudon Quarterly Review, July, 1868, presented by Mr. Yale.

EARTHQUAKES IN THE KERN RIVER REGION.

Mr. J. E. Clayton read a paper describing the earthquakes in the Kern River region, as observed by Dr. Farnsworth.

A discussion on the theories of earthquakes followed.

Dr. Gibbons remarked that it was a natural tendency of the human mind to aim at new and novel theories to account for phenomena, and if a theory has the merit of being one's own, and novel, a man would defend it as earnestly as a parent will defend his deformed and ugly brat, simply because it is his own. The Electric theory was unphilosophical, and unworthy of a scientific man. Why should we seek for strange and mysterious causes when geology gives us so simple and reasonable an explanation? The study of the earth's surface would satisfy any candid mind that our globe was once much hotter than now, and at some distant period in a melted state. If so, only the outside has cooled as yet, and the interior is still a molten mass. Combustion need not be going on—the heat is there and retains the matter in a melted form, until time is given it to cool. The present contortions of the earth's surface must have been caused through this igneous agency, and when such action takes place, vibrations and tremblings must ensue. Humboldt stood upon the brink of a crater and observed that an eruption was always preceded by rumblings and shocks, exactly like our earthquakes. In this case we know that fire and gases are concerned, and the cause is in the interior; then why not allow that our shocks are produced by this same agency in subterranean caverns? This molten matter is at rest, but when water gains access, combustion ensues, and volcanoes and earthquakes result.

Mr. Clayton said he once unintentionally illustrated another cause in the following manner: He had constructed a tub four feet deep and five feet in diameter. Having filled this tub with water, and wishing to beat it, he inserted a pipe in the water through which he introduced steam for the purpose. The result was, that a series of shocks was produced, and the tub danced around the room like a thing of life, till it was finally rent in pieces. We might have reservoirs of water beneath us—which no one could deny—and a stream of hot water might gain access; the result would be an earthquake. The Geysers were an illustration of these causes on a quiet scale. As a further corroboration of this, he said earthquakes were more frequent in countries where there has been the greatest disturbance of the earth's surface, and hence caverns were more likely to exist. The settling of the earth in places, most probably filled these caverns, and we had seen instances of the water from these reservoirs rising to the surface and forming springs. The earth has also been rent in the same manner that the tub was. Very light shocks are continually taking place from these causes.

Mr. Yale thought that earthquakes were perpetual and not exceptional, but it is only the more severe ones that we experience. When a boy, he once entered the Mammoth Cave in Kentucky with a party, where he remained forty-eight hours. While there, a tremendous thunder-storm took place in the "outer world," "but no sound of that e'er came down to the everlasting depths of those dark solitudes."

Dr. Kellogg also thought the electrical theory unphilosophical. If electricity throws down a chimney simply, it makes a deafening report; how then could it throw up mountains, or shake the earth so silently?

The Chairman stated that it had been decided to make no more appointments of lecturers, but that volunteers would be called upon at each meeting to deliver a lecture at the next, if time permitted.

The next regular meeting will be held on December 21st, 1868, at the rooms of the Academy, 622 Clay street.

Elisha Brooks, Sec.

New Incorporations.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Railroad Avenue Homestead Association.—San Francisco. Dec. 5th. Capital stock, $56,100; 170 shares, $330 each. Trustees: Andrea Sbarboro, C. F. Brown, Wm. Harvey, Wm. J. Gunn and Geo. F. Walters.

Mechanics' Insurance Co.—San Francisco. Dec. 5th. Capital stock, $100,000; 1,000 shares, $100 each. Trustees: D. Jordan, F. Schwartz, P. Fogarty, J. L. Connell, J. W. Conrad, W. A. Tanks, John R. Fishbeck, John Feehan, W. Y. Weir, Thos. Mooney, M. C. Kennedy, Daniel Norcross, Michael Hayes, Jas. McDonough, Holmes Finnigan, R. Ring, Michael Dolan, C. N. Sharkkart, Conrad Greh, N. F. Neil, H. N. Geils and Robert C. Page.

Patent Sewer and Drain Pipe Co.—San Francisco. Dec. 8th. Capital stock, $100,000. Trustees: J. H. Wise, S. P. Christy, Thomas Dennigan, A. C. Robinson and W. J. X. Robinson.

Tuolumne City Steamboat Co.—San Francisco. Dec. 11th. Capital stock, $7,000; 70 shares, $100 each. Trustees: F. Heinecke, H. Jones, Henry M. Covert and John W. Laird.

It is said that Calisaya Bark has a peculiar effect upon the liver, and guards the system against diseases by exposure and irregular diet. It is conceded that the great success of the wonderful Plantation Bitters, which, previous to our late unhappy difficulties, was found in most Southern homes, was owing to the extract of Calisaya Bark which it contained as one of the principal ingredients. In confirmation of this we have heard one of our distinguished Physicians remark that whenever he felt unwell from ordinary dietetic or atmospheric causes, he invariably relieved himself by Plantation Bitters. We speak advisedly when we say we know it to be the best and most popular medicine in the world.

Nevada City, Nov. 3d, 1868.

Messrs. Dewey & Co.—Gentlemen:—Your favor of the 30th ult., is just received, informing me of the successfull prosecution of my application for a patent on my "Hair Cutting Shears." Please accept my sincere thanks for the speedy and successful manner in which you have conducted the case, and believe me, as ever,

Very truly yours, Lee D. Craig.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, December 12, 1868.

City Stocks.

We note sales of Spring Valley stock at $65 25 @$65; San Francisco Gas at $79 25@ 76 25, and $77 ₱ share. A few shares of Oakland Railroad stock sold at $57 50.

The Bank of California will pay its usual monthly dividend on the 15th inst. The Merchants' Mutual Marine Insurance Co. disbursed its usual dividend on the 10th.

The Mechanics' Insurance Co. filed a certificate of incorporation in the office of the County Clerk on the 5th inst., with a capital stock of $100,000, in 1,000 shares of $100 each. Place of business, San Francisco. Directors—D. Jordan, F. Schwarz, P. Fogarty, J. L. Connell, J. W. Conrad, W. A. Tauks, John R. Fishbeck, John Fechan, W. Y. Weir, Thomas Mooney, M. G. Kennedy, Daniel Norcross, M. Hayes, James McDonough, Holmes Finnigan, R. Ring, Michael Dolan, C. N. Shurkkart, Conrad Greh, N. F. Neil, H. N. Geils and Robert C. Page. It will be noticed that the names of the Directors of the Builders' Insurance Co. are freely interspersed in the above, among the rest that of Thomas Mooney.

Mining Share Market.

The mining share market, for the period under review, was less active, and the fluctuations in prices did not cover so wide a range as the previous week. Considering the rather quiet market, prices have been well sustained. At the close considerable improvement is noticeable in several of the leading stocks, predicated upon better indications in their lower workings.

Savage—opened at $70@68 50, improved to $77 50, then sold at $74, and closed at 77. The November receipts of bullion aggregate $119,760, while in October the receipts amounted to $128,000, and in September $140,000. A dividend of $4 ₱ share is payable to-day (the 12th inst.) On the fifth station no pay ore has yet been encountered, while the Potosi chimney—on the third station—again, it is said, yields considerable ore.

Imperial—rose from $102 to $121, and closed at $116. The receipts in November amounted to $35,943 63, against $58,229 17 in October. From a dispatch dated the 11th, we learn that they "found two feet of ore on the 900 level, which assays $30 to the ton."

Chollar-Potosi—sold within a range of $148 @163, and closed at $162. During the week ending December 4th, they extracted 1,400 tons of ore, against 1,237 the previous week. The ore recently taken from the mine requires more careful sorting, and the stope does not look as well as it did several weeks ago. The sinking of the incline has been suspended for the present. Bullion returns in November amounted to $102,722, against $112,898 in October, and $78,013 in September.

Yellow Jacket—fluctuated considerably the past week, opening at $1,475, declining to $1,260, improving to $1,390, and at the close selling at $1,353. The *Safeguard*, of the 5th inst., has the following: "The company will declare another dividend on the 1st of January next (probably $300), and after that date the stock of the company will be sold in shares of twenty to the foot. It is thought the office of the company will be removed to San Francisco, and that dividends will he declared monthly after the date named. The shaft is fifty feet below the 900 level, and work will be suspended in the bottom of the shaft pending the contemplated repairs to the pump, the fifty feet sump, meautime, serving as a reservoir to catch the water. A large quantity of first-class ore has been sacked in the east drift, 900 level, although operations in that part of the mine have not been very active during the past week. The north drift, 800 level, which also cut the same body of ore, is looking well. Work will he suspended about three days for repairs. Among the improvements to be made, will be the putting up of an eight-horse power engine to run a blower to furnish the lower level with fresh air. This engine will also run two saws in the carpenter shop—one to saw timbers for the mine, and the other to saw wedges, instead of hewing them out, as heretofore, which will greatly facilitate the timhering of the mine."

Gould & Curry—improved from $96 to $106, and closed at $103. The sinking of the main shaft has been suspended until the shaft is thoroughly repaired. The annual meeting of the company will take place on the 28th inst. An assessment of $15 per share was levied on the 5th inst.

Belcher—was in the market at $175@ 190. This company has commenced the shipment of ore. It is reported that the rock in the east drift, from the 730 level, is easily extracted, and it is believed the ledge will be reached in the course of several weeks.

Mexican — came into the market at the close of last week, a few shares selling at $20. This mine is now incorporated and placed on the Stock Board list. In early days it was among the most noted on the Comstock, and at one time would have commanded higher figures in the market than any other claim on it. Alsop & Co., the English bankers, we believe, bought it in the spring of 1861. Since that time, however, this firm has declined an offer of $1,400,000 for the mine and improvements, and very recently closed the whole concern out for $12,000. At the present time the mine is in the hands of contractors, who are engaged in retimbering the old shaft. They (the contractors) furnish all the necessary tools, engine, etc., and receive in payment for the improvements made, a large amount of ore, such as may be taken from the mine, at nominal figures.

Empire—realized $112 50@115. The receipts for November amounted to $16,908, against $16,804 in October, and $18,837 in September. ....Confidence sold at $37. The November bullion returns foot up $13,983, against $22,831 in October....Gold Hill Quartz shows a yield of only $2,326 for the month of October, being the result of only one week's run, the mill idle the balance of the mouth for repairs. This rock sold at $48@50....Segregated Belcher sold at $8@8 50. This mine is reported to look more favorable of late.

Crown Point—advanced to $53, closing at $51. The receipts of bullion during the month of November amounted to $51,515, and tho disbursement for the eamo time foot up $48,447. In September the bullion returns aggregated $44,369....Kentuck shows a yield of $86,096 78 in bullion for November accouut; the October returns amounted to $69,145....Amador yield for November amounted to $47,160. This mine continues to look as well as heretofore reported....Occidental sold at $25. It is reported that tho yield of this mine during the month of Novemher was $39,900.

Hale & Norcross—improved from $69 to $83 50, then at $78, and closed at $81. The drift is now in and timbered about 100 feet.... Overman shows a bullion yield of $34,000 in November.

Lady Bryan—sold to a larger extent than for a long time past, opening at $17 50, declining to $13, rising to $18, and closed at $17. The shaft is down 180 feet, and a croes-cut at that depth has developed a hody of good ore 2 feet thick, which appears to widen out as sunk upon. The rock worked from this mine herctofore has heen from the croppings, but it is thought a considerable quantity of high grade ore will soon be ready for milling.

Alpha—sold within a range of $33@41 50, and at the close realizing $43.....Ophir sold at $34@36.

Bullion sold at $18@20. "The incline from the 1200-feet level (1,275 feet) is now down 40 feet, is progressing at the rate of 2½ feet per day, and will be steadily pushed to a depth of 200 feet—making a total depth of 1,475 feet. Drifting on the 1200-feet level is also heing carried on."

New Zealand Gold, again.—The *Standard*, Oct. 10th, gives an extract from a letter received from a colonist, a part of whieh we quote: "The Shotover claim has not been worked six months yet, and the owners have taken more than 40,000 ozs. of gold out already. The drawbaek at present is the want of machinery, but there will soon be plenty of that. In November last I got into a claim along with some other men, whieh, I am glad to say, is turning out well. The name of our elaim is the Star of the South. We had twenty-four tons of quartz crushed whieh turned out 124 ounces, or at the rate of five ounces to the ton. I sold half my share for 10*l*. shortly after I got iuto the elaim, for want of money, but since then the man that I sold it to has sold it again for 200*l*. Several shares have been sold out of the elaim for 270*l*. I was offered 220*l*. for my half share, but refused it."

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Substitutes for Tanners' Bark.—Some Boston men have commeneed running a tannery in East Leverett, Mass., using but little hemlock bark, but instead sweet fern, hard-haek, mayweed, and some astringent drugs. The local papers state that they pay forty dollars per ton for hard-haek and sweet fern.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Nov. 28th: L. L. Lewis, Supt. of construction of the Monitor Consolidated Co. will put on an increased force next week, and push the work of finishing the flume, and get the mill running with all possible dispatch. The success of the Morning Star Co. in treating their ores by chlorination, has more clearly defined the course of those having mines and mill property in this county.

Chronicle, Nov. 28th: The working of the Morning Star ore by the chlorination process at the Pioneer mill, Markleeville, has proved a grand success. The successful working of this ore will be of incalculable benefit to Alpine County. The company have a heavy body of ore in their mine.

On Tuesday last J. G. Slaven, Supt. of the I. X. L. claim, shipped from this place, through Wells, Fargo & Co., 912 ozs. of bullion from ore from the above mentioned mine.

The finishing touches will be put on the new hoisting works of the Morning Star Co. to day, and the fires will be started up next Monday.

F. A. S. Jones has lately commenced work on the Michigan Tunnel & Mining Co's claim—the original location on the well-known Tarshish ledge. He has started a tunnel to pierce three parallel ledges. The Tarshish ledge will be cut at a distance of 700 ft. The tunnel will be run, night and day, a distance of 4,000 ft.

Calaveras County.

Mokelumne Hill *Chronicle*, Dec. 5th: The Whisky Slide correspondent writes: After leaving the Kennedy mine I visited the mill, and found it pounding the precious metal from Petticoat rock. They are now receiving at the mill a lot of ore from the Hopper & Chapman mine. This mine was discovered about two weeks ago, and bids fair to rival in richness anything before discovered in the district. They have 30 tons of rock to crush that they estimate at $80 per ton. The miners in the locality of West Point appear to be doing well.

Kern County.

Havilah *Courier*, says: Two hundred dollars were recently taken from two pounds of rock from Mr. Kneadney's mine, near Havilah.

Nevada County.

Transcript, Dec. 2d: The Erie mine, at Enreka, upon which machinery was put recently by O. Crandall, promises to be one of the best mines in that vicinity. After getting their new pump in operation the mine was worked seven days, and 105 ounces of amalgam taken from the batteries alone. The gold from this mine is worth $18 per ounce. The connection has been made between the two shafts, and the ledge which is exposed for some distance looks well in every part.

Dec. 3d: Some time ago a company of Chinese bought a mine at Mauzanita Hill, Sweetland, and commenced work. The "Melican" miners had been running for the lead on the west side and south end of the hill. The Chinamen made average runs, taking out about $3,000 at each clean up, and started in on the east side near Wood's hotel. A short time since they struck the true lead, and have since been taking out from $12,000 to $14,000.

Gazette, Dec. 3d: A new quartz ledge has recently been discovered three-fourths of a mile from the Salathiel mill, with flattering results. The ledge has been christened the Cocomongo.

Dec. 4th: The first clean up from the Hitchens & Larrimer ledge at Grass Valley, since it has been under the management of Frank Morse, was made on Tuesday last. The result was a brick worth about $6,100. This amount of bullion was the product of 124 loads of quartz, the rock yielding nearly $48 per ton. The ledge has been christened the "Bay State." The rock was crushed at Ben. McAuley's mill, but the old Larrimer mill will soon be in working order so that rock can be crushed at the mine.

Stidger, Evans & Co., yesterday purchased the mining claims of the Granite Tunnel Co., on Buckeye Hill, in Bridgeport township, paying therefor, $50,000. These claims are adjoining the celebrated Buckeye Hill claims of Stidger, Evans & Co., and have yielded during the last 18 months over $180,000.

This purchase, in connection with the Buckeye Hill claims, makes one of the most extensive and valuable hydraulic claims in the State.

Grass Valley *Union*, Dec. 3d: A new and splendid looking quartz ledge, which is to be called the Safety, has been struck close by this town. The rock shows free gold and plenty of heavy sulphurets, and will pay from $15 to $20 per ton on the croppings.

We understand that the Channel Co., whose locations are on Squirrel Creek below Rough and Ready, made arrangements in San Francisco to get means to run a bedrock flume in that creek. The claims of this company are virgin, and contain good gravel.

Grass Valley *National*, Dec. 2d: The claims of the Consolidated Channel Co., at Peron Valley, having been examined and confirmed by the U. S. Land Office at Sacramento, there is nothing to prevent the speedy working of these extensive and rich gravel claims.

Transcript, Dec. 6th: Some very extensive mining operations are being conducted in Birchville Mining District, Bridgeport township. Buckeye Hill has heretofore been worked from the north side by the Buckeye Co., composed of about a dozen persons. The Granite Tunnel Co. have been running into the same hill from the south side. This is an incorporated company. The Tunnel Co. got out of grade in their tunnel, but the Buckeye tunnel was deep enough to work all the ground about which a question of title had been raised by the two companies. Efforts were made to settle the question, the Buckeye offering $40,000 to the other company, but no adjustment could be agreed upon, and recourse was had to the Courts. Suit was commenced in the District Court, asking an injunction and assessing damages at $20,000. The suit was a few days since compromised by the Buckeye buying out the Granite Tunnel Co. for $60,000. The Buckeye Co. has been taking out from $20,000 to $24,000 after each run, and by this purchase the company obtains undisputed possession of a large range of excellent gravel, and will not only be able to work its own ground, but also that heretofore held by the Granite Tunnel Co.

Grass Valley *National*, Dec. 4th: Mining locations are being made as frequently as in the palmy days of the fall of "'49 or the spring of '50," and White Pine will have to look sharp to its laurels. We have chronicled at least a dozen locations within as many days, and still the work goes on. Another ledge was located yesterday which promises to be a valuable one, showing the precious metal in abundance. It has been christened the Sargent.

We were shown to-day a bar of gold weighing 60 ounces, and worth $1,200, the yield of ten tons from the Banner mine.

Dec. 5th: Sam. Locke, Superintendent of the Hope Gravel Mining Co., showed us to-day some dust worth at least $1.50, the product of a single pan of dirt. There is plenty of rich gravel.

Dec. 6th: Arrangements are being made to have a crushing from the Sargent ledge, and the Superintendent says he would not give a cent to be insured $20 per ton for the first 40 tons from the croppings. The Sargent may be set down as a good thing in the future.

Frank Morse, who had a good crushing a few days since from the Higgins & Larimer ledge, is making his arrangements to sink on the ledge, and has let a contract for that purpose. The Higgins & Larimer rock will pay its way.

Jo. Perein's mill, on Wolf Creek, is crushing a large lot of rock from the Grant ledge, which is situated in the neighborhood of Forest Springs. The Grant has always turned out well, and the present crushing will run as high as $70 per ton, according to estimates made by good judges.

The Boyce mine, near the Eastern boundary of the town, continues to yield good rock. A crushing of this rock will come off next week, and several more of our enterprising miners will be in funds.

Placer County.

Grass Valley *National*, Dec. 5th: The Fortuna mine is located near Yankee Jim's, Placer County. The ledge will average four ft. in thickness. A tunnel has been run 100 ft. on the ledge, and a shaft sunk 30 ft. in depth. The surface rock has yielded $10 per ton, exclusive of the sulphurets. There is an abundance of water and timber at hand, and rock can be taken out and milled at an expense not to exceed $5 per ton. Over 250 tons have been already taken out. John Phillips, one of the owners, brought up some of the sulphurets for assay. They were worked at Oscar Maltman's works on the Nevada road and yielded at the rate of $165 to the ton. The sulphurets were not well cleaned, containing nearly 40 per cent. of sand, and it is expected that the clear article will be worth at least $240 per ton.

Plumas County.

Quincy *National*, Nov. 28th: Goodwin & Co. are making good wages in the old claims at this place. The company are running a tunnel in the lower end of the old Gloyd claims. It is believed by miners who are familiar with the ground, that the lead runs through a point of the hill at this place, and is covered by a slide.

Dickerson & Co. have commenced work on the old Massac ravine, which is situated some three miles back of Johnson's Ranch, in this valley. This ravine was partially worked several years ago, and abandoned. The company are putting in a large flume, and from the way the ground prospects they think they have a good claim.

At Sawpit Flat and Washington Hill the miners are taking out large quantities of pay dirt. The Buckeye, American and Union companies have water to wash up every day. Their claims are paying largely; from $8 to $16 a day to the hand. At Nelson Point we are informed that Fell & Co. are making big wages; so are Stevens & Fowler.

Sierra County.

Nevada *Gazette*, Nov. 30th: One of the most productive and promising quartz mining localities in the State, is the Sierra Buttes district, in Sierra County. The leading mineral vein, on which the principal mines are located, is the Aerial, which lies along the southerly slope of the mountain, runs nearly east and west, and dips northerly into the mountain. The famous Reis mine has been the longest worked and is best known, and is now producing from $40,000 to $45,000 a month. Two mills, one of 12 and the other of 16 stamps, are kept running constantly, and about 20 men are employed in the mine and mills. Adjoining the Reis Co. on the same vein, are the claims of the Woods Co. on the west, and of the Kentucky Co. on the east. The Woods Co. have two very large chimneys on their ground, from which they are taking out good rock, and keep supplied their 24-stamp mill. The company employs 90 men. The Kentucky mine is now owned by Bishop & McKenzie, who have 3,000 ft. on the main vein, including four large ore chutes or chimneys. A considerable quantity of rock taken from these chimneys has been packed a mile on mules and worked in arastras, and yielded more than sufficient to pay expenses. The owners have recently leased the Phœnix mill, which they will keep running this winter, having constructed a wagon road from their mine to the mill. They are endeavoring to effect arrangements to put up a large mill next spring, as they could easily keep 40 stamps employed. Besides the main vein there are numerous smaller ones forming a junction with it, some of which are of good size and carry rich ore. Among these are the Phœnix, Hawkeye, Rose and Cliff. The two latter join the Aerial on either side, near the easterly end of the Reis ground, and form a large and very rich pay chimney. The district is one of the most promising in the State, and affords a fine field for prospectors and the investment of capital.

Downieville *Messenger*, Dec. 5th: A chunk of gold weighing 9¾ ozs., was recently found in Johnson's diggings at Galloway Hill. These claims are reported to have been paying well most of the time this year.

The Independence mill is being rapidly rebuilt, and so situated as to be secure from all future snow slides. It will not be long before it will be running once more.

The Belmont *Champion*, of Nov. 28th, gives the following account of the discovery of a new mining district, which shows the high state of excitement which exists in that portion of the county. Saturday morning last, Shoshone Jack brought into town a few pieces of rock which he had broken from a ledge 50 to 60 miles south of this place. Jack came in search of Myers, in whose employ he has been a greater portion of the time for the past two years. Upon finding him, Jack gave him the ore, and also a description of the locality, size of ledge, etc., in the best English at his command. Myers and Billy Taylor had a portion of the rock tested, which gave an assay of $351 per ton. Sunday evening a party was made up for the purpose of visiting the place described by Jack. It was arranged that Myers, Capt. Watson, Geo. Pridham and the Indian who had informed Myers and Taylor that no white man nor any other Indian knew anything about the locality of the ledge, were to start early on Monday morning. In the meantime other parties had got an inkling of what was in the wind, and Schram found two Indians who said they knew the spot where Jack had got the rock, and proposed to go with him to the place. Schram, with the two Indians, left town about 11 o'clock Sunday night, with a supply of provisions sufficient to last them for six or eight days. About eight o'clock Monday morning Pridham, Watson, Myers, and their Indian left town in a light spring wagon for the new El Dorado. By 10 o'clock, news of the new and rich discovery had been spread throughout the town, and by half-past 10 parties commenced leaving on horseback in pursuit of the wagon. From this time until 12 M. every five minutes witnessed a new departure, whilst many who had no horse to ride, no money with which to pay for the hire of one, and none to hire, if they had, were running about the streets as if wild, cursing their luck. The first party overtaking the wagon, after "sparring" for a time, when interrogated as to where they were going, etc., acknowledged that they had heard of the late discovery and concluded to go along with them and locate an extension on the "big thing." The next party coming up with the wagon informed the party that all Belmont was on their trail in hot pursuit. Upon receiving this information Myers and company, as any other sensible men would have done, returned home and locked the Indian up in a private room for safe keeping and future operations. In a short time the "Smart Alecks" commenced putting in their appearance, looking very much as if they had been badly sold. Every manœuver of the party having possession of the Indian was closely watched, but notwithstanding the close watch kept, about eleven o'clock that night Billy Taylor left town with the Indian, and succeeded in alluding all pursuit. When it was ascertained that the Indian, in company with one or two men, had left, the excitement became terrible; parties mounted their horses and rode all night in search of Taylor and the Indian, but not succeeding in finding them, they returned on Tuesday, by which time the town had begun to assume something of its usual quietness. On Tuesday evening all the parties returned to Belmont, and from Schram we learn that he found and located the ledge at 12 o'clock on Monday, and that it is at least eight feet wide, and crops out above the ground for several hundred feet; that it has but little if any dip—and that to the east; that the ore very much resembles that of the Highbridge; also, that Taylor and his company arrived at the spot about a day and a half too late to secure the first location, but just in time for choice extensions. Schram brought in some of the ore, which assays away up in the hundreds.

Yuba County.

Marysville *Appeal*, Dec. 4th: L. Ackley informs us that the Smartsville Consolidated Hydraulic Mining Co. and the Blue Point Gravel Mining Company are preparing to make the largest blasts ever made in this State. It is expected that everything will be ready by the 15th inst, when 1,200 kegs will be discharged by galvanic battery by the former company, and 800 kegs by the latter.

ARIZONA.

Prescott *Miner*, Nov. 14th: We learn that work will soon be resumed on the Platanca silver lode, which is near the Sterling. A shaft 15 feet deep has already been sunk upon the ledge, and it is the intention of the owners to have work commenced in the old shaft and sink it still deeper. The Platanca is very rich in silver, and its proximity to the Sterling mill and sulphuret works make it a very desirable mine.

We learn that from four to seven tons of rock are being got out of the Sterling mine every 24 hours. The mill will soon be started on refuse rock, in order to find out defects in sluices, machinery, etc., and remedy them before commencing to run through rich ore. Work on the furnace is delayed on account of scarcity of brick. The rock now being taken out is said to be very rich.

IDAHO.

Owyhee *Avalanche*, Nov. 28th: The New York mill has been running for the last five days on Poorman ore. It has been thoroughly trimmed and is in excellent running order. There are hundreds of cords of furnace wood at the yard.

The Minear mill started up on the 13th and is running on Home Ticket ore.

Louis Alpey has discovered another rich ledge near Silver City, which he has named the Silver Fleece.

There are 60 men employed on the Golden Chariot mine.

The Poorman is being fitted up for the winter's run.

NEVADA.

Reese River.

Austin *Reveille*, Nov. 26th: Cottonwood, in Palmetto district, is developing the Kentucky and Silver Champion mines with splendid success. Our correspondent sent us specimens of the ore, of which he writes those mines are producing large quantities. He represents the vein of the Kentucky

to be from nine to ten ft. wide, and the workmen are opening the second level 160 ft. below the surface. The mill of the company has been delayed for want of skillful masons to construct the roasting furnaces, but it is completed and was set in motion on the 10th inst.

Nov. 28th: The El Dorado mine in Silver Bend district is a true fissure vein of the grandest dimensions. It is covered by locations to the extent of a mile, but the only claims that have been developed are that of the Belmont Co. and the El Dorado South. This latter opens in bonanza, which may prove to be 160 ft. wide. In the large working incline which is 175 ft. deep, the vein has been cut through from the foot wall 60 ft. without disclosing the head wall. The narrowest part of the vein in any of the workings is 25 ft. The course of the vein is nearly north and south with its dip to the eastward, and it lies between smooth perfectly defined walls of the hardest slate. The four inclines have been sunk within 500 ft. of the northern boundary, and all of them cut through solid quartz. The vein in the El Dorado South has been traced nearly the entire length of the claim. It is a genuine fissure vein, loaded with noble ore. While the mine of the El Dorado South is full of promise in its hidden depths, it is rich in fruit at the surface. The splendid deposit of chloride ore which occurs along the length of the claim is peculiar, and the mine was worked for a long time before its great value and extent were discovered. Near the surface this ore is of the color of sulphur, but as the excavation descends it becomes darker and almost brown, and it appears to be uniformly rich in silver. We placed the value of the 400 tons of ore which lie upon the surface at $300 per ton. The sum of $75,000 in coin was offered for the lot by an experienced miner and mill owner, but the owners of the ore refused to sell it even at that figure. The El Dorado is a grand silver vein.

Nov. 30th: A correspondent writing from White Pine says: The mill of the White Pine M. & M. Co. erected at this place by Jeremiah Miller, commenced operations about 10 days ago, since which time it has been running with great success, crushing small lots of ore mostly from Chloride Flat. Without knowing exactly what these ores have yielded in every instance it may be stated that they have milled from $250 to $300 per ton, the results being highly satisfactory to the miners. The Oasis mill at Shermantown is running again on the Eberhardt ores, having lately completed a considerable crushing from the Stonewall claim on Chloride Flat. The ores from this claim yielded from $300 to $400 per ton, the Eberhardt averaging about $800. The Treasure Hill mill, being erected about a mile south of this town, is now being pushed rapidly forward towards completion, and it is expected will be running before Christmas. The machinery for another mill to be put up at Shermantown has partly arrived, that for one or two others being on the way. Still additional mills are talked of as likely to be brought into the district during the winter, and it would not be surprising if we had half a dozen or more running here by spring. Mr. Greely, the assayer to the White Pine Mill and Mining Co. to-day cast four silver ingots, weighing 1,236 ozs. each, being the first bars ever produced in Hamilton. They are from amalgam turned out by the company's mill, and are the product of miscellaneous lots of ore.

With the present favorable weather a good deal of work is being done upon the mines. The Eberhardt Co. having completed their ore-house and new hoisting shaft, are again raising ore from their mine. The Keystone is also yielding ores freely, while from various others, such as the Hidden Treasure, the two Auroras, Genesee, Stonewall, etc., considerable quantities are being taken out daily. Great activity prevails on Chloride Flat, two-thirds of those sinking shafts in that locality having found good millable, and in many cases very high grade ore.

Dec. 1st: The Belmont stage, which arrived in this city last evening, brought seven bars of bullion from the mill of the Belmont Co.

During the month of November the Manhattan mill of this city shipped 8,449 lbs. of silver bullion, of the value of $133,367.22.

Eight bars of bullion were brought into this city last night which are the first produced by the White Pine mill at Hamilton.

Dec. 2d: Some 3,000 ozs. of bullion, produced by the old Dominion mill at Hot Creek, were brought into the city last evening.

Wells, Fargo & Co. shipped from their office in this city during the month of November, 212 bars of bullion, weighing 17,285 lbs., and valued at $282,837 74.

Virginia *Enterprise*, Dec. 3d: A correspondent writing from Belmont thus describes the base metal range at White Pine: Opposite, to the west, is the higher summit of White Pine, called the "base metal range," and here the metallic substance is more massive, but contains lead in abundance as well as other metals, with considerable silver. I have no doubt that, some day not far distant, the base metal range will be the prominent feature of White Pine, but, at present, it is only prospected slightly; and yet I have seen assays from its rock which, three years ago, would have created a stir in mining circles.

In short, there is at White Pine abundance of ore from the "pure stuff" which only needs smelting down, through all the grades of silver ore, to that which is so near pure lead that it will not pay in any way that silver ores are worked in America.

Another correspondent writes: About 60 miles south of White Pine, on the White Pine range, nearly due east from Belmont and Hot Creek, new districts have been discovered in slate formations. The matrix is a fine quality of white quartz; the ore is greenish and yellowish in the pay streaks, and the white portion of the quartz is injected, or shot, with spots of metal resembling molybdinite. Several assays show silver from $10 to $1,300 per ton. These new districts will be fine ones, if they prove to be rich and durable, as they are in close proximity to the finest range of building timber now known east of the Sierras, with abundance of water and salt there at hand.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Dec. 2d: The hoisting works of the Exchequer Co., formerly the Minerva works, were yesterday destroyed by fire, loss from $20,000 to $25,000.

John Dohle of this city has several men at work in mining out the foundation of the old Farrington arastra mill, between C and D streets, north of Mill. These arastras were worked in early days, and rested upon the earthen floor of the building, into which a great amount of quicksilver and amalgam found its way and was lost to its owners—so much that it is now found profitable to mine out the whole place. Not only are the old arastra beds being dug up, but all the ground which once formed the site of the large shed inclosing them, and even ground adjacent. The dirt dug up about this old establishment is sifted and then worked in pans, after the usual fashion. Although workmen have been engaged in working this curious mine for several weeks, it is by no means worked out—the quicksilver and amalgam having worked down to a considerable depth in the loose soil, and the tailings sluiced out of the arastras having spread about and enriched a large space in the vicinity.

Dec. 3d: The Bullion Co. are now at work 1,240 feet below the surface.

To-day the Belcher mine commences to ship ore to the Sapphire mill. The Supt. estimates that he has at least a ten-months' supply of ore in sight.

Dec. 4th: Promising ore is now being found in a drift east from the 800-foot level of the Imperial. It is thought that a winze 30 to 40 feet deep will strike a body of good pay ore.

The Imperial-Empire shaft is now down 1,082 feet, at which point the rock is quite soft and easily worked.

During November, the yield of the Occidental mine was $39,900, and in December, probably not less than $50,000 will be taken out.

Dec. 5th: The mill of Birdsall & Co., Dayton, was partially supplied with ore from the Occidental mine during the month of November, and returned to the owners of the mine, as the result of the ore reduced, 1,121 pounds of bullion, worth $32,000. The mill is now receiving a full supply of ore, and the yield of bullion is about $1,500 per day. The company expect a return of $45,000, as the result of a full month's run upon their ore by the above named mill. The ore is sent to the mill without assorting, and pays a clear profit of from $6 to $7 per ton over mining and milling expenses. Over 100 tons per day are now being sent from the mine.

There was shipped by express from this city and Gold Hill during the past week, 8,529 pounds of assayed bullion, valued at $216,718.85.

Several claims to the eastward of the Comstock, in the vicinity of the Occidental, are being steadily prospected by their owners with good indications of their ultimately proving paying mines. The leads upon which work is being done are principally silver-bearing.

Dec. 6th: The new blower for this mine arrived yesterday, and will at once be set up and put in operation.

The Imperial yesterday shipped, by Pacific Express, four silver bars, valued at $13,886.74.

Prevention of Danger from Stored Petroleum.—"The dangers to which petroleum exposes houses, vessels, and cities have led several scientific men so turn their attention to the invention of some method by which these perils may be averted. It is no easy matter. Petroleum oil emits at ordinary temperatures such light gas that it infiltrates through the best closed walls. Ignorant of the presence of this highly inflammable gas, no precautions are taken against it, and the least spark—a match or the red ashes of a pipe—may inflame it and produce an explosion. To prevent this danger Mons. Verstreat proposes to clear the holds of vessels and the atmosphere of cellars where petroleum is stored by currents of air. These currents would sweep away all the petroleum gas floating in the hold or cellar, prevent the infiltration of the gas into other portions of the vessel or house, and make the air in the hold or cellar inexplosive. He produces those currents of air by a ventilator moved by hand. It is said the French Government contemplates requiring all vessels laden with petroleum to use some such method while in French ports."—*Exchange.*

Scientific Rascality in Commerce.—It is no longer a secret of the chemists's laboratory that clear, golden syrups can be made from starch and sulphuric acid; that delicious wines and brandies can be made from beet roots; that a barrel of peanuts can be transferred into excellent coffee; that lard can absorb an enormous quantity of water in certain conditions; that in fact there seems no limit to the adulterations that an intelligent and dishonest chemist can practice upon his fellowmen. All these marvels of chemical science have, in these latter days, become degraded into mere tricks of trade, and their beauty is in their capacity to enable unscrupulous dealers to lighten, pocket and destroy the stomachs of the confiding and consuming public. Concerning the article of champagne, a writer in the Portland *Star* tells us that it is made from a thousand different substances—even from refined petroleum. Yes, from the fiery benzoles a sparkling, foaming champagne can be produced, which will delight the eye, tickle the palate, gladden the heart momentarily—but quicken our pace toward the grave. This is a new use for petroleum, which those who have been experimenting with it as an agency for generating steam have little dreamed of. Who can say that the Pennsylvania oil territory, now considered mostly worthless, may not some day be regenerated into the great champagne-producing country of the world. *Cincinnati Journal of Commerce.*

The Silver Ore Deposits of the Interior.—In 1860, when the first silver mining was begun at "Washoe," Prof. W. P. Blake wrote, regarding the eastern slope of the Sierra, and the interior as follows:

The region is one where metamorphism of the rocks has been most intense and complete, and where eruptive porphyries, not unlike those of the Mexican plateau, abound. It is probable that these extensive silver-bearing veins will be found to be coincident in direction with belts of limestone, and near them. A belt of limestone, probably of the age of the carboniferous, is found in connection with quartzites, or metamorphosed sandstones, at the southern end of the Sierra Nevada on the eastern slopes, and the formation is, without doubt, extended northwards through the region of Owen's River and Lake, and the Walker River country to Carson Valley, and beyond. This belt of country, extending over five degrees of latitude, and about 400 miles in length, should be immediately explored. We venture to affirm that it will be found rich in minerals, and in silver-bearing veins.

Another Underground Railway.—New York is to have one. The *Commercial Advertiser* says: "No more plowing through slush and mud; no more fighting for standing room on the platform of street cars; no more getting up for fat old ladies with market baskets, or thin young ladies with camel hump; no more wordy wars with conductors on rainy days over torn stamps; all, all such things are to pass away, and we are to dash through the Stygian bowels of Manhattan Island at the rate of forty miles an hour."

Who ate Roger Williams.—Steele's *Fourteen Weeks in Chemistry* says:

The truth that animal matter passes from the animal back to the vegetable, and from the vegetable to the animal kingdom again, received a curious illustration not long since.

For the purpose of erecting a suitable monument in memory of Roger Williams, the founder of Rhode Island, his private burying ground was searched for the remains of himself and wife. It was found that everything had passed into oblivion. The shape of the coffins could only be traced by a black line of carbonaceous matter. The rusting hinges and nails, and a round wooden knot, alone remained in one grave; while a single lock of braided hair was found in the other. Near the grave stood an apple tree. This had sent down two main roots into the very presence of the confined dead. The larger root, pushing its way to the precise spot occupied by the skull of Roger Williams, had made a turn as if passing around it, and followed the direction of the backbone to the hips. Here it divided into two branches, sending one along each leg to the heels, when both turned upward to the toes. One of these roots formed a slight crook at the knee, which made the whole bear a striking resemblance to the human form. There were the graves, but their occupants had disappeared; the bones even had vanished. There stood the thief—the guilty apple tree—caught in the very act of robbery. The spoliation was complete. The organic matter, the flesh, the bones of Roger Williams had passed into an apple tree. The elements had been absorbed by the roots, transmuted into woody fiber, which could now be burned as fuel, or carved into ornaments, and bloomed into fragrant blossoms, which delighted the eye of the passer-by, and scattered the sweetest perfume of spring; more than that—has been converted into luscious fruit, which, from year to year, had been gathered and eaten. How pertinent, then, is the question, "Who ate Roger Williams?"

Cook's Telegraph.—The *Journal of the Telegraph* says of Cook's improvement of Bonelli's apparatus: "The printing is done in fine bold letters, the words well compacted and spaced, and printed not on a continuous strip, but line under line, as in a printed circular. The great advantage of the autographic process is that it renders error next to impossible. The message is set up and compared before it is transmitted, and if it goes at all, must go exactly as first prepared.

The paragraph before us is one of thirty-five words, transmitted in twenty seconds, a speed equal to 315 messages of twenty words each per hour. We will not be surprised if, in time, parties who prosecute much of their business by telegraph should supply themselves with telegraphic type, arrange their messages for transmission in a case adopted for that purpose, prove them before sending to the telegraph office, and the operator have nothing to do but pass them through the manipulating instrument."

Mexican Mines.—A writer in the London *Mining Journal*, after describing the lawlessness and the unsettled state of things existing in Mexico as obstacles to the development of the rich mines in that country, thus concludes: "The absence of means of communication throughout so large a portion of the Mexican territory, and the wretched condition of the few that do exist, is another great impediment in the way of industrial development in this country, and a more striking exemplification of this with respect to mining operations cannot be offered than by alluding to the fact that it is stated by an English gentleman employed upon the railway, projected between the capital and Vera Cruz, that if the line were completed the deshecho, now thrown aside as worthless, in the important mineral district of Pachuca, might be conveyed, all expenses of land and sea freight included, at the rate of from $25 to $30 per ton to Swansea, where it would be worth from $45 to $47 per ton for smelting."

Large Grain Elevator.—Boston is to have an elevator which will hold 250,000 bushels of grain. It will be erected by the Boston and Albany Railroad Corporation. Everything will be done by steam, and a car load of grain can be brought from Chicago, emptied, and the car returned the same day. The process of emptying will occupy only ten minutes.

OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

San Francisco:

Saturday Morning, Dec. 12, 1868.

Notices to Correspondents.

THE RATTLESNAKE'S FANG.—A long and exciting argument recently took place at the American Hotel, in Salinas City, in regard to the manner in which the rattlesnake poisons his victim, the formation of fangs, etc. A great diversity of opinions was elicited, and the discussion culminated in numerous bets. By throwing a little light on the subject, as to the formation of the rattlesnake's fangs, the manner in which the virus is injected into the bite, you will much oblige "Salinas." *Answer.*—The rattlesnake's fang is a hollow tooth connected by a duct from its root, with a little vesicle containing the poisonous secretion. When the rattlesnake bites, the vesicle is compressed, and the poison is simultaneously injected into the wound made by the tooth. Showmen and others extract the fangs, and the reptile is then harmless. But Prof. Siebold, the zoölogist, of Munich, says that a close examination of the root of the fang will disclose a concentric structure, from which as many new fangs will grow out as there are old ones extracted. Diagrams of the rattlesnake's fangs may be seen in almost any of the standard works on zoölogy.

MATHEMATICIAN.—Europe owes its first acquaintance with algebra to the Arabians, from whom, by the medium of commerce, it was first introduced into Italy early in the thirteenth century, by Leonard Bonacci, a merchant of Pisa, two of whose manuscripts dated 1202, and 1228, are mentioned by Bossali. Many manuscript writings of a similiar nature appeared shortly afterwards in various parts of Italy; but the first *printed* works on the subject are those of Lucas Pacislus de Burgo Sante Pepulchri, whose principal production is that entitled *Summa Arithmeticæ et Geometricæ, Proportionumque et Proportionalum*, which was published in 1469.

ENQUIRER—Wishes to know the effect of altitude on the proof of spirits, as compared with a low one, when tested by the hydrometer—say the difference between San Francisco and a place 900 feet elevated above the sea. Our reply is, that if due allowance is made for the difference in temperature, the variation in strength, as indicated by the hydrometer, would be imperceptible for all economic purposes, and we might also add for the nicest scientific ones also. If by symbols, chemical ones are meant for describing anhydrous and proof-spirit, to the latter would have to be added + a9 to those employed to denote alcohol.

TEMBLER.—Earthquake study has obtained a distinct scientific definition, which is well recognized by scientific men, the term employed is Seismology, derived from a Greek word *(seismos)*, a movement like the shaking of a sieve. The instruments employed for the observation of this phenomenon are named Seismometers.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Metallurgical Treatment of the White Pine Ores---their Ingredients.

During the last few weeks some rich White Pine ore has been brought to this city, the silver having been extracted from different places. A few pounds of the Eberhardt ore were smelted in Kustel's assay office, yielding $5.67 per pound—equal to $11,340 per ton. The bar was only .771 fine, as a great deal of the base metals came out with the silver. At the same office, thirty pounds of White Pine ore were reduced in one of Varney's recently improved pans, after previous roasting. In order to decompose chlorides, and principally to grind the ore fine before amalgamation, (which had to be performed without grinding), the muller was allowed to run for one hour, after which fifteen pounds of quicksilver were introduced. These fifteen pounds turned into amalgam almost instantly, so that the sudden conversion arrested the muller. This being raised and brought in motion again, another charge of ten pounds of quicksilver showed exactly the same result. When finished, thirty-six pounds of pressed amalgam were obtained from thirty pounds of ore.

The almost instantaneous thickening of twenty-five pounds of quicksilver is proof that in this case roasting did not only not interfere with the amalgamating ability of the melted horn silver, but that it seemed even to promote it. The bullion was .796 fine. The ore contained *copper, antimony, lead, arsenic*, and *sulphur*, besides *chloride of silver* as the principal ingredient. Where the most lead is found there is also the largest amount of arsenic, and the reverse. It is therefore very probable that arseniate of lead occurs with the ore; but there is also a light yellow mineral in the shape of a powder, containing *antimony, lead* and *silver*. The silver of this last mineral cannot be extracted by amalgamation, without roasting; and in regard to the sulphur combination, amalgamation is also questionable.

In view of the immensely large proportion of horn silver to the other silver combination, and the quantity of base metals entering the amalgam after roasting, it is by all means preferable to amalgamate the rich White Pine ore without roasting, and to save the tailings for another operation, if they are rich enough.

OLD BLOCK ON THE PACIFIC RAILROAD.—A pamphlet entitled, "The Central Pacific Railroad, or '49 and '69, by Old Block," has fallen into our hands, and afforded us much pleasure,—from associations of the genial author, Mr. Delano, the banker, of Grass Valley. He dedicates it "to his old comrades who crossed the plains in '49, those who suffered weariness and toil, hunger and thirst, in threading their dubious way over the great desert." Old Block is widely known as a true first-class story teller. Between the fall of '49 and the spring of '50, if our memory does not confuse the circumstances with something else that happened about the same time, there was much snow in the high Sierra, and at a jolly tavern away up on the Henness Pass road somewhere, a circle of great story-tellers wintered, and burned large quantities of cord-wood. Educated and prime fellows, whom instinct had led into the path of empire and destiny,—though not in every case afterwards into commensurate wealth and fame,—they created an atmosphere, by the mingling of such ideas and humor as fellows of the kind might be expected to possess, which seems to the Californian of to-day like history and romance of ages past, though only twenty years ago, and within the recollection of all who will participate in the great railroad celebrations of 1869. That atmosphere clings around Old Block to this day, in all that he says and writes. He has told the story of the Pacific Railroad. We hope that he will yet spin out many a yarn of California life and character in the glorious foothills, to which he belongs, and where he has been himself an actor.

Metallurgical Establishments.

TAYLOR'S SMELTING WORKS.

On the east side of Eleventh street, between Howard and Folsom, Messrs. Robert and William Taylor are carrying on an extensive business in different branches, all of them partaking of a metallurgical character, viz.: in galvanizing iron, casting the plates required by electrotypers, making anti-friction alloys and Babbit metal for machine shops, also type and stamping metals, tinners' and plumbers' solder, and in smelting gold, silver, lead, and antimonial ores. The works are quite unpretending, being only of a temporary character. A shed roof at the rear of a wooden dwelling house, covers three or four different kinds of furnaces, and in the open air are wooden troughs to prepare the iron for galvanizing, also an iron trough to contain melted zinc, to galvanize water pipe.

Most important, but least continuously used, in the interior, is a small reverheratory furnace capable of smelting several tons of ore or dross per day. As it costs about $25 a day to keep this in operation, and as large batches of refractory ore are not now frequently sent in, the reverheratory furnace is used only occasionally, and chiefly to reduce the gross or oxidized metals sent here by stereotypers, type founders, tinners, etc. Either English, Sydney or Vancouver Island coal is used. Mount Diablo coal is found to give a large but impure smoky flame without intensity of heat, and is therefore not used, though it has been found to answer at North Beach. For ordinary drosses no flux is made use of. Gold or silver ores in small batches are smelted in graphite crucibles in a wind furnace set in the ground, which we found in operation; the principles made use of being the same as in assaying on a large scale, or in cupola smelting on a small scale. If lead is contained in the regulus, cupelling is effected in a very simple manner; a small cupel is made, being simply a dish of bone ash, to contain the regulus, and it is set into the small reverheratory furnace, where the fire strikes over it from one side, and a blast of air is introduced from another, created by hand with an ordinary blacksmith's bellows.

Easily fusible ores, metals and alloys are treated in a simple iron kettle, set in brickwork. This is constantly in operation, doing the principal work of the establishment. The proper mixture of the white metals is here made for the purposes for which they are required, to order or otherwise. For electrotyping, flat plates of zinc and copper are cast, to hang into the acids, where the electric current is created. For type metal an alloy of lead and antimony is made. Babbit, or anti-friction metal, is cast for the foundrymen in small blocks; it is seldom called Babbit metal now, because a poor quality of that alloy caused it to get a bad reputation in some quarters. For galvanizing (so called, more properly plating) zinc is used, being melted in suitable vessels, where the iron to be coated can be dipped in, after having been made bright by subjecting it to the operation of dilute acid. The object is simply to protect it from rust. Iron water pipes are now generally subjected to this treatment, as well as sheet iron, etc., for special purposes. It is claimed that water pipes so protected will last three times as long as ordinary pipe. Sheets are plated at four cents a pound, and pipes at four cents a foot.

Supplies of crude sulphuret of antimony are derived from a mine owned by the Taylors, and others, located about seventy miles southerly from Gilroy, in the Coast Range; but it is found that the metal can be imported more cheaply at present than the cost of mining and smelting will sum up at.

MOSHEIMER'S METALLURGICAL ESTABLISHMENT AND SCHOOL.

This is a notable curiosity shop, in the metallurgical way. Mr. Mosheimer seems to be well read in all the old and new processes, and there are certainly evidences left at his works,—partially in remnants and heaps,—of his having tried almost everything that science offers, to aid in unlocking the wealth which nature has put into the prospector's hands. The works are located at No. 2005 Powell street, near North Beach, occupying a rear building of considerable size. In variety of metallurgical and mining appliances, they are best described by referring to the table of contents of some metallurgical book. Furnaces and smelting apparatus are in preponderance; but there are also concentrating machines, leaching and chlorinating tanks, a stamp mill, a centrifugal crusher, several peculiarly-constructed amalgamating pans, etc.—articles too numerous to to catch the eye of the visitor in any limited space of time. At one side is the laboratory and assaying room, where matters are tried in a small way, by the wet or dry processes. Underneath the house, adjoining, is the wooden department, where all kinds of wooden machines are made, for experiment as well as for use, and where odds and ends of the same are stored.

Having been engaged in the special field of metallurgy on this coast even earlier than the discovery of silver in Washoe, Mr. Mosheimer is, like his works, an epitome of all that has taken place. He was formerly a partner of Kustel's, for a time. Amalgamation having soon run into a regular and easy channel, he has devoted himself specially to the treatment of refractory ores, and to smelting, and instructing miners cognizant or possessed of "feet" that proved unavailable, or but partially so, by ordinary processes. Furnace building, both for roasting and smelting, has been occupying much of his attention.

A steam engine in one corner of the establishment furnishes the power to run a two-stamp mill, besides the concentrating machines, crusher, fan for blast purposes, etc. For the smelting of ores, Mr. Mosheimer depends mainly on his cupola. It is a small upright, iron-cased, brick-lined furnace, similar to those used in iron foundries, with the blast entering in the same manner. He finds it available for his purposes, in the reduction of copper and iron, as well as of silver and lead ores. At the present time it is engaged on an experimental charge of magnetic iron sand from the ocean beach near the Cliff House. A mixture of clay and lime, the equivalent of marl, is used to close or line the furnace for smelting, being tamped in with an iron wedge.

For roasting, three different kinds of furnaces attracted our attention; firstly, a small muffle furnace, not differing in principle from the muffles described in the books, where the flame does not come in contact with the ore; secondly, Mosheimer's shelf furnace, a large cupola or chimney-shaped structure, having shelves made of clay ware alternating down the sides, combined with a horizontal roasting furnace at the bottom. The ore enters at the top, drops from one shelf to another, meeting a greater heat, and the flame of the fire finally, as it falls; it is worked forward when it reaches the hearth, so as to be subjected last to the greatest heat admissible, in the vicinity of the fire-place. In principle this is excellent—combining the spontaneous combustion of sulphur taken advantage of in the kilns and in Gerstenhæfer's *schutt* furnace, where the roasting does not pretend to be complete, with the ordinary hearth, which finishes the operation in the usual manner. Practically, it is evident that the proportions of the hearth to the hight of the shelving, and the degree of fire to be made relative to the length of the hearth, involve problems to be solved only by experiment, or by the aid of a very intimate experience of the nature and chemistry of the ores in roast-

ing. Thirdly, there is a new Bishoff's reverberatory furnace, for the reduction of magnetic sand (oxide) by a process similar in appearance but the reverse in principle to roasting, with the admixture of coal, into metallic iron in the condition called "iron spongo." Mr. Kidwell holds the patent for this country. The furnace resembles a common hearth roasting furnace, but as the principle is that of reduction, instead of oxidation, the operation has to be performed under effective exclusion of the air—an object very nicely accomplished by putting the laborer's door at the same end of the furnace as the chimney, and directly opposite to the fire-place, whereby the ore is caused to be constantly covered by a sufficient body of the yellow reducing flame.

With something of the make-shift talent which characterizes sailors, Mr. Mosheimer has converted a useless "centrifugal crusher" into a very good blower, to heat up his cupola.

Besides carrying on Plattner's chlorination for gold, when the ores contain also a considerable percentage of silver the Patera process,—extraction with hyposulphate of soda,—is applied as a secondary operation, in order to obtain the silver. This is the plan also pursued by Kustel; though at Swansea, and at Central City, Colorado, the Ziervogel process is said to be used for silver.

A machine for the separation of magnetic iron sand from ordinary beach sand, is worthy of mention, being an invention of Mr. Mosheimer's. A revolving cylinder has a great number of horse-shoe magnets all over its surface, and an endless cloth belt running over the top of them, so as to touch their ends, extends round a second cylinder. By means of a mechanical feeding contrivance, the sand is brought close to the cloth-covered magnets; grains immediately jump up, a distance of one and two inches, and adhere, in bunches, to the cloth, until they are carried beyond the sand reservoir, when the cloth parts company from the magnets, and, as there is no force remaining to hold up the magnetic grains, they are dropped into a box supplied for the purpose of receiving them. In this manner magnetic sand can be separated easily from ordinary sand, by wholesale.

Mr. Mosheimer's metallurgical instruction is confined to practical matters, students generally remaining from a week to two months, at tuition fees ranging from $150 to $250; and receiving a certificate as to what they may have acquired if they desire it. Amongst his students have been the following gentlemen:

Messrs. G. Gray, of San Francisco; Dr. Hunter, of Sacramento; Mr. Neystrom, Chief Engineer, U. S. Navy; Mr. Currie, of London; Michael English, of San Francisco; Dr. Graham, of Columbia, Tuolumne County; Wm. Jones, Supt. Sanlsbnry mine, Tuolumne County; S. Shugard, Mining Superintendent, Amador County; Mr. Kirkpatrick, of the Quicksilver Works at Napa; F. Kasseler, Supt. of Chlorination Works at Coulterville, Mariposa County; Theodore Stahl, Supt. of Mill and Chlorination Works at Placerville; N. Armstrong, of Rocky Bar, Idaho; N. Steiner, of San Francisco; Wm. Parrier, of Idaho; W. L. Davis, of Somersville (Mount Diablo Coal Mines); Mr. Hanscom, Mining Superintendent, Amador County.

Now working in the establishment: Mr. Chas. Cavalline, Idaho; Mr. Garland, Amador County; Charles Heister, White Pine.

THE STANDISH STEAM PLOW has gone on the ranch of Mr. Keliehors, on the Clayton road, near Pacheco, in Contra Costa County. Nine hundred acres lie there which cannot be plowed at all in the ordinary manner. In such soil we are informed that the Standish plow accomplishes fifteen acres a day. A new Standish plow is being built at the Union Foundry for a man named Miller.

The Anglo and Spanish American Pacific Slope Exposition.

Attention is called to the advertisement of David R. Smith, civil and mechanical engineer, in another column, relating to the charge of articles of Californian and Oregonian production and industry, at the Chilian Exposition, to be opened at Valparaiso next April. If there is any significance in geographical situation, touching the history and destiny of nations; if we have manufacturers and merchants in our midst who are more than village tradesmen; if the Pacific Railroad means anything,—we apprehend that not merely Anglo-American blood, but North Western American industry, as developed in the wake of our mining operations, will make its presence felt at Valparaiso. They reduce some kinds of copper and silver ore more economically, and consequently to greater profit in Chili, than we have learnt to do as yet. They have skillful and educated miners and metallurgists. Domeyko's name and fame ought to extend over our similar mining area. They have new amalgamation processes of merit, that we do not hear of, except from limited personal sources. They have undergone, long since, the raw mining and metallurgical experiences in which North American miners and capitalists delight to flounder, and to which 95 per cent. succumb, from want of existing knowledge or experience in that which they are undertaking to do. They are utilizing the chemicals of their alkali plains, and furnishing the world with the principal ingredient to make powder. They have commenced building their railroad over the Andes.

We are furnishing them with wood and whale oil. We may furnish them with heavy iron manufactures, with mining and milling machinery, with woolen products, with shoes, ships, etc.—we will not attempt to make out the list. We have cheap labor at our command,—Chinese,—if we choose to avail ourselves of it. Whether we shall improve our opportunities abroad, or continue to assimilate our energies in internal growth, by reason of greater rewards and greater necessities in that direction, to the neglect of our geographical capabilities, can only prove a matter of time; while it remains true, in industry as in mining, that the first occupants of the field will possess its most valuable advantages.

FORETELLING EARTHQUAKES. — Every country has its earthquake prophets. How many has the luxuriant soil of San Francisco produced, whose fame has extended to Havana? We are a little jealous of the scientific rise of the Antilles, for they have philosophers whose bold words do not fall still-born within the circle of their own greatness. The San Francisco dailies of the 11th, contained the following:

HAVANA, December 8.—Professor Delisser, of Kingston, Jamaica, who, a long time in advance announced the days on which an earthquake would visit St. Thomas, Chili and Peru, announces that there will be an earthquake in California about the 11th of December.

"THE BANNER MINE."—The workmen in the Star Spangled Banner mine, Nevada City, have just sent us a subscription club for the PRESS of ten names, in addition to the copies already taken by the proprietors of that mine. Thus, in more ways than one, are we reminded of the superior intelligence of the operative miners of this country over those of any other portion of the globe. It is needless to say the cash accompanied the above list. The "Banner" is a splendid paying mine.

THE SCIENTIFIC CHURN. — This patent churn, which is highly spoken of is now being introduced on this coast, as will be seen by advertising notice in this paper. We shall endeavor to give our readers an illustrated description of its arrangement and operation soon. Messrs. McConathy & Kincaid, of Pacheco, Contra Costra county, are owners of the patent right on this coast.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

---

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17 1m

---

Mr. Mowry, lately a clerk in a hotel at Colfax, is requested to call at the office of the MINING AND SCIENTIFIC PRESS, No. 414 Clay street, below Sansome, San Francisco.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 23v17-ainn

---

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

---

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local columns afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and language; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

DAVID R. SMITH,
Civil and Mechanical Engineer.

PATENT

Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs it or can to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.

A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.

These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.

For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing· Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hansbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents

---

METALLIFEROUS MINERALS.—The perusal of the Mineral Statistics, just issued, for 1867, leads to some very interesting observations. Pyrites, which were formerly used only for the extraction of the contained sulphur, are now made to yield an important quantity of copper, the Spanish pyrites alone giving 500 tons of fine copper from the quantity of ore treated in the works on the Tyne. Wolfram, again, which was formerly regarded only as a most annoying impurity in tin ore, is returned (to the Stannaries Court) as a useful product by East Pool Mine, which sold 10½ tons, of the value of £62. Barytes, the producers of which were not long since seeking in vain for a market, figures for upwards of 11,000 tons, of the value of nearly £8,000; and that which is the more gratifying is that both sulphate and carbonate have been sold. In the utilization of arsenical ores, and as the price of the article is perhaps the best indication of its appreciation, the figures are subjoined showing the prices given per ton of 21 cwts. for the past four years at East Pool: August, 1864, 10s. per ton; August, 1865, 12s.; August, 1866, 25s.; August, 1867, 53s. 6d.; March, 1868, 60s. 6d.; and August, 1868, 84s. 6d. per ton. It will be noticed since March last the price has increased more than 25 per cent., and during the past four years more than 800 per cent.—*London Mining Journal.*

GEOLOGICAL TABLE.—An elaborate table, showing the British fossiliferous strata and their characteristic fossils, arranged in the order of superposition, or chronological succession, has just been published (through Mr. Stanford, of Charing Cross) by Mr. Wm. Parsons, Sapper R. E. The sheet may be considered as a new edition of that issued some years since by Prof. Morris, the results of recent researches being carefully embodied. It is mentioned, by way of note, that the information has been obtained principally from Sir Charles Lyell's "Elements of Geology," Sir R. Murchison's "Siluria," Prof. Tennant's "Catalogue of British Fossils," Dr. S. P. Woodward's "Recent and Fossil Shells," and other works of equally reliable character. The information given is carefully arranged in six columns, the class, (such as palæozoic, mesozoic) bracketing the system (Silurian, Devonian, and so on), and these again the typical groups of rocks, the average thickness of the strata, and the characteristic fossils; the last column being occupied by series of interesting remarks. The table gives evidence of a large amount of labor having been bestowed upon it, and will, doubtless, prove of considerable value to geological students generally.—*London Mining Journal.*

THE PHILOSOPHER AND THE MECHANIC.—"Modern like ancient society fosters an invidious distinction between those who discourse on principles or natural laws, and those who apply them. The former are philosophers—a superior class; the latter are mechanics—an inferior one! Like other evils of caste this is also in a fair way of being exploded. God is the author of principles and the applier of them. He has made none which are not at work in creation—in truth, creating is the result of their applications. It may be well enough for some to delight more in abstract truths than in their exposition in nature and art; but they should remember that vastly more, and more varied, thought is required for the application of a principle than is expended on its discovery. *They* are endless, and will never cease to elicit new thoughts, while *it* is an act as it were but of a moment. It is the true mission of our species here to apply principles for our purposes as God applies them for his own, and that implies the creation of a world of art conterminous with and in unison with that of nature."—*Cor. American Artisan.*

NEW CORN HARVESTER.—An Illinois inventor has a machine for harvesting corn. It takes two rows at once. The stalks are taken between projecting metal-faced fingers, and as the machine advances the butt of the ear is brought in contact with a short sickle, playing at the rear of the fingers, cutting it off, while the stalk passes under the machine without being pulled up; the ears are received into a large hopper at the rear of the machine, and discharged when it is full.

THE TANNING and currying works of Messrs. J. S. Ricker & Co., at Portland, cover an area of two acres, with brick shop 94x24 feet. Fifteen thousand sides of Union leather, 5,600 sides wax leather, 5,000 calf skins, and 1,000 extra selected backs, of oak and hemlock tannage for belting, is the annual production.

SLATE QUARRY.—There has been left at Dr. Holden's drug store, a specimen of slate rock taken from a quarry that is being successfully worked by Thomas McCarty, at Copperopolis. The rock is of a soft, argillaceous character, splits readily into smooth, thin lamine, and in color is of a bluish brown or gray. It is found in abundance, and would appear to be valuable for roofing purposes, mantels, billiard beds, table tops, and even pavements. We are informed that it is easily quarried, and worked readily into any desirable laminated form, which may yet make it of considerable commercial value for the above purposes.

LIQUID GLUE.—The following is Mr. Knaffle's recipe: Three parts of glue, broken into small pieces, should be covered with eight parts of water, and left to stand for some hours; one-half of chlorhydric acid and three-fourths of sulphide of zinc must then be added, and the whole exposed to a temperature of from 178° to 192° Fah. during ten or twelve hours. The compound thus formed does not gelatinize; it only needs to be allowed to settle, and will be found most useful for mending porcelain, and glass as well as wood.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to

Another Kind of Electric Earthquake Theory.

As the following has reference to interesting physical phenomena which the author believes to be similar in cause and operation to earthquakes, we publish it gladly, in the hope that as many more earthquakes theories as may now be launched and proudly floating in brains of a scientific turn, may come speedily to a focus, and like playful fishes, eat each other up:

EDITORS PRESS:—Much has been said already in your esteemed PRESS about earthquakes, their causes, etc. If you will permit the thoughts of one of your subscribers a space in your paper, I would respectfully call your attention to a correspondence in the San Francisco *Abend Post*, (German), somewhere near or between the 30th of November and the 8th of December, 1865, in which I gave a proper classification to all earthquakes and their causes. To prove that earthquakes are certainly created by electric power, I would advise some of your scientific gentlemen to try to decompose water by electricity. A proper instrument for the purpose would be the *voltameter*. Each of the gases, hydrogen and oxygen, will pass to their respective pole (positive or negative), and will create a certain rise in the water. By this action I intend to show that our tidal waves, the rise of rivers and lakes, are the production of electric currents passing through the water. Should my idea prove to be the correct one, then it must be understood by the honorable Committee on Earthquakes that no practical plan for buildings can be adopted, unless it is based on some theoretical foundation. For my opinion, I would say that there are no remedies for *internal* and *local* earthquakes, but some plan may be provided to check the power of those I classify as externals, and which are the most frequent and destructive ones. They will occur in countries where thunderstorms are in part or entirely absent. Sometimes this class of earthquakes will not reach their maturity, and will generate over into whirlwinds and storms. External earthquakes are the fountain of all others; their electric power is, through the agency of powerful conductors, carried into the inner part of our earth, lakes, rivers, etc. They are also the creators of volcanoes, which will, from time to time, be ignited by action of external earthquakes; hence their periods of action. It is further my opinion, that we are not influenced by the moon or other bodies, and that no degree or line as to the extension of earthquakes can be drawn. So much for the present, from yours truly, CARL F. BACHMANN.

San Francisco, Dec. 9th, 1868.

Snowy District, Santa Barbara County.

EDITORS PRESS: Snowy District was discovered in December, 1865, by Mr. John B. Treadwell and party, and it is situated in the northeastern part of Santa Barbara County. All supplies are brought from Los Angeles, which is 130 miles distant by wagon road. The principal mines here are the Snowy Valley, Pinch-Out, Lead-Ore Juniper, and are owned by Mr. Treadwell and party.

The Snowy Quartz Mine promises to become one of the richest mines in this part of the State; it stands at an angle from 20° to 30°, and is from two to eight feet wide in talcose slate, and has reddish clay seams between the walls and ledge, cropping out for several hundred feet on the surface. I prospected all along the croppings, and never failed to obtain a few colors of gold. There is a tunnel run in on to this ledge 60 feet, and it shows a good mine all the way; the quartz is soft and can be worked without blasting. It is not a pocket ledge, for the gold is found in every place, and will average $40 to $60 per ton.

The Lead-Ore, Pinch-Out, Valley and Juniper ledges are equally as rich as the Snowy mine, but not equal to it in size. The facilities for wood and water are unlimited. Mr. Treadwell is putting up a prospecting mill, to run by water, which he intends to have running soon. A. T. STONE.

Nov. 8th, 1868.

THE MINING AND SCIENTIFIC PRESS comes to us this week in a new dress throughout, much improving its appearance. The PRESS is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is ten weeks. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge;* the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a SPECIALITY of legal jurisprudence; or, as Mr. Phillips, an eminent patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of *responsibility* and *experience*. As agents with such qualifications, we solicit honest patronage.

Candid Reasoning.

A gentleman eminent for his ability in all points pertaining to specifications, gives inventors the following sound advice:

To properly prepare a specification may seem a very simple and easy task, but such is not the case. It requires a knowledge of the arts, of science and scientific terms, and their proper use—of mechanics and the principles that govern their action—of law, and of the grammatical and legal force and construction of language, which is possessed by but very few persons.

Lawyers seldom possess the mechanical knowledge, while mechanics still more generally lack the legal knowledge necessary to enable them to properly prepare a case for examination.

It requires such a *combination* of legal and mechanical knowledge, together with a special knowledge of the principles and rules that govern the action of the office, that no person is really competent to undertake the business but those who *have made it a study, or had experience at it.* In view of these facts I unhesitatingly advise every person who has an invention worth patenting to get some responsible and competent agent to attend to it for him.

No person scarcely would think of entering upon a suit at law without employing a lawyer to attend to it, and make out his papers for him; and if a sensible man would not do that, much less would he attempt to prepare an application for a patent without knowing anything about the business.

I am aware that persons frequently attempt it, but I am also aware that *many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given when once rejected.*

Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their invention, and is therefore useless. It is for this reason that many applicants are compelled to reissue their patents at as great, and often greater expense, than the obtaining of the original.

Hence I repeat, every person having an invention worth patenting should employ a competent and responsible agent—I say *competent and responsible*, for, unfortunately, there are many who are neither competent nor responsible.

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When *properly* made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers with a copy of the laws governing the same, but does not seek to point out its incorrectness, unless there be some glaring defect.

If worth filing at all, these cases should be prepared with very great care and caution.

One intentor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Our fee for a caveat varies from $10 to $15. The Government fee is $10.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented, or "Patent applied for."

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Patent Rejections.

FIRST. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from $20 to $40.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	10
On every application for a design, for 3½ yrs and 7 mos	15
On every application for a design, for seven years	5
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Illustrate your Inventions.

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,
414 Clay Street, below Sansome, San Francisco.

SEPTEMBER, 1868.

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

CASES OF THE
COLLINS METAL
(IMPROVED OROIDE)

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notice that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full Jeweled Patent Levers;* those for Ladies an improved Escapement, better than a lever for a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. Those for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $6. Also, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part of the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well known among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends, and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office State Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E. COLLINS & Co.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid but on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,982. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. PHIPPS.

Machinery.

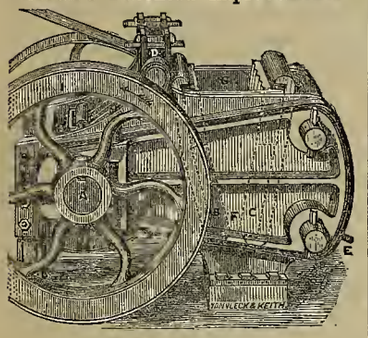
VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Of 9-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....**$600**

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....**850**

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....**1,200**

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13-1y Stove Store, No. 1 Clay street, below Davis

Fire, Hose and Machine Belting.

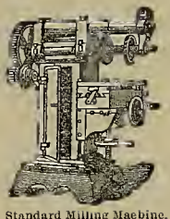
THE SUBSCRIBER CONTINUES TO MANUFACTURE Oak Tanned Leather Fire Hose, warranted superior to Eastern Hose, manufactured at the Sixth Street Tannery, San Francisco,
21v13tf JOHN J. FULTON.

HYDROSTATIC WORKS.

SAN FRANCISCO
Pump Manufactory
And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.



House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired. Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere. ☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

Standard Milling Machine.

Pipe Vise, with or without Extra Jaw.

UNION VISE COMPANY,
OF BOSTON, MASS.

Extra jaw, and heavy Vises, Warranted for heavy work. New style Wood and Covered Screw Vises, forty styles and kinds; Standard Milling Machines, simple, great capacity, power and strength—two sizes, large, 2,300 lbs; small, 950 lbs. For sale by the trade.

DEWEY & Co.,
Mining and Scientific Press Office, San Francisco

THE MINING AND SCIENTIFIC PRESS, of this city, has done us the honor to notice us in their columns, and we feel in duty bound to acknowledge the compliment.

It were fruitless for us to say anything in praise of the MINING AND SCIENTIFIC PRESS. * * * It speaks for itself wherever it goes. Its editors are men of intelligence, ability and honor.

We have had frequent occasion to have business relations with the patent agency connected with this establishment, and have had nothing left to desire in regard to it. Fidelity, promptness and courtesy, soon arranged everything for us to our complete satisfaction. Having had frequent delays at Washington while in that city, we have been surprised at the promptitude with which some of our friends obtained their patents through the agency of Messrs. Dewey & Co.—*S. F. Spiritual Light.*

PASSENGER RATES ON THE POSTAGE PRINCIPLE.—Raphael Brandon, says *All the Year Around*, is the author of a new scheme of railway organization, promising results as wonderful as ever the street seller of Bisnagar vaunted of his carpet. It is simply an adaptation of Sir Rowland Mill's post-office scheme to railway passenger traffic. He proposes to treat a passenger like a letter, and send him anywhere over the kingdom, regardless of distance, at a fixed minimum charge. A three-penny stamp shall take you, third class, any journey in one direction, you like to go, whether from Ludgate Hill to Sydenham, or from John O'Groat's to Lands-end. If you prefer second-class, you will take a sixpenny stamp; if you luxuriate in first-class, your postage will amount to one shilling. This sounds as mad as the penny postage innovation sounded at first. But Mr. Brandon quietly proceeds to argue in his pamphlet that it would pay everybody, shareholders, the public and the Government, besides giving renewed impetus to industry of all sorts. The sum proposed to be charged for passenger postage looks ridiculously small. In reality it is not much less than the average fare at present paid for the average journeys as might be supposed. In 1865, in round numbers, 3,500,000 passenger trains run over 71,000,000 miles, carrying 252,000,000 passengers. The traffic produced £14,724,302. This gives an average for fare, at present paid, per average journey, of 14d. only. Now, says Mr. Brandon, give me a universal 3d fare everywhere, and I will promise you six times the traffic, which will give the united railway interest an excess of £4,000,000 of receipts, with very little, if any addition to the expense of carrying an increased number of passengers.

But that is merely supposing that each person paid but threepence. It is calculated, however, that, of the increased number of travelers, one-seventh would ride first-class, at one shilling, and two-sevenths second-class at sixpence. This would raise the annual return to £32,000,000 for passenger traffic, instead of £14,750,000, as at present. Does some one say that the analogy between carrying a passenger and carrying a letter is false, because a letter is but half an ounce, and a passenger is really a meaty hundredweight? Which is, by far, the most expensive part of the postal system? The transit of a letter or its delivery? Its delivery. Granted, then, that the transit of a passenger is something more expensive than that of a letter, the passenger's side, for the additional expense of transit is nothing to the saving in distribution and delivery.—*N. Y. Correspondence of the Bulletin.*

TIN.—The following is from a communication to the London *Mining Journal*:—"The tin mines in Cornwall were working long before the birth of our Saviour, but at that period the tin was found in great masses on and near the surface; in fact, the valleys were rich in tin a few feet only below the surface, and the richest deposits were invariably found nearest the fast, or solid rock. The "fast" was the ancient term for rock. These valleys were turned over by a class of laborers called streamers, and the tin was found at comparatively little cost beyond the labor, which was low, when compared with the price paid at the present day. The tin obtained from the islands of Bauca and Billiton is found much in the same way as the tin was originally found in Cornwall. Tin in Banca, etc., is procured by Chinese coolies at a very cheap rate—from 3d. to 5d. per day—but in Cornwall the price of labor is at least 2s. 6d. per day. Formerly men's labor in obtaining tin in Cornwall averaged from 10d. to 12d. per day. Men and their families lived differently in days of yore. Barley bread was largely consumed by the mining population formerly, but in the present day such a thing as barley bread is the exception in the cottage. You may see such an article on the rich man's table, but never on the poor man's.

PEAT FOR SMELTING.—B. M. Peirce, M.E., recently a student at the *Ecole des Mines*, Paris, is attempting to demonstrate at the Marquette Lake Superior iron mines, the adaptability of this kind of fuel to the smelting of ores in blast furnaces, the question being mainly one of economy compared with coal. Crumbling, and consequent choking up of the furnaces, have been the difficulties encountered heretofore. If peat can be made to answer the purpose, Mr. Peirce is the man to prove it. Extraordinarily pure peat has been found to answer to a limited extent.

THE GOLD-BEARING ROCKS.—Sir Roderick Murchison, in the new edition of his "Siluria," has modified the views first put forth by him as to the distribution of gold in the earth's crust. His more recent conclusions are:

1.—That looking to the world at large the auriferous veinstones in the lower silurian rocks contain the greatest quantity of gold.

2.—That where certain igneous eruptions penetrated the secondary deposits, the latter have been rendered auriferous for a limited distance only beyond the junction of the two rocks.

3.—That the general axiom before insisted upon remains, that all secondary and tertiary deposits (except auriferous detritus in the latter) not so especially effected, never contains gold.

4.—That no unaltered, purely aqueous sediment ever contains gold, the argument in favor of the metal is prodigiously strengthened; or in other words, that the granites and diorites have been the chief gold producers, and that auriferous quartz bands in the palæozoic rocks are also the result of heat and chemical agency.

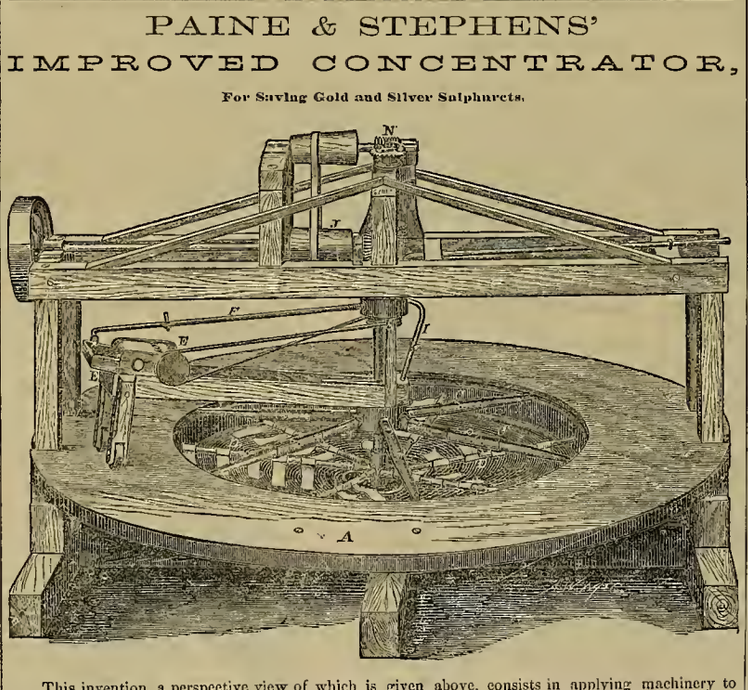
Orders from the interior faithfully attended to.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.
Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.



One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16-3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,
For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

THE GOLDEN ERA.
Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.
THE GOLDEN ERA
Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Our Patent Agency.
THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past few years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Copper Reduction Works at San Francisco.

We are informed that a company is perfecting organization for the purpose of erecting copper reduction works at San Francisco, probably in the vicinity of the Dry Dock, at Hunter's Point. As it is in the metallurgical difficulty,—the economy of reducing low-grade ores in this country,—where our copper interests have met their *quietus*, the new wet process of Bischoff promises something that we all hope may be realized to the profit of the parties concerned and the advantage of the coast. Similar works have been put up at Virginia City to operate on transmontane copper ores; but as that location is at a distance from actual copper mines, and not in a center of easy natural communication, it is presumed that the objects there were mainly experimental.

Bischoff's process is to roast copper sulphurets to such a stage of freedom from sulphur and combination with oxygen, as is recognized in the form of sulphate of copper—chemically, nothing more nor less than blue vitriol. Being then soluble in water, the sulphate of copper is leached out, and spongy metallic iron, prepared by a peculiar process from black sand (magnetic iron), is thrown into the solution. As the sulphur prefers iron to copper, the latter is dropped almost instantaneously, falling to the bottom in the form of a red metallic powder. Impurities in the copper which result in the smelting product, are here avoided, rendering the further refining of the copper to a marketable state easy.

It is proposed to introduce the refined copper so produced at once into the market on this coast. Up to this time all the copper used in the arts and trades on the Pacific has been imported. It would seem, certainly, in view of the demands of the market, and of the many localities on the coast where sure-producing copper mines have been exploited past the experimental stage, that copper reduction and copper mining are worthy of further inquiry and of careful attention by stock owners and capitalists, who would profit from all that has been tried and done in that direction.

POLYTECHNIC SOCIETY.—A meeting was held on Thursday evening at the Committee Rooms of the Mechanics' Institute, by those interested in the formation of a polytechnic Society in connection with the Institute. The number present showed the great interest taken in the subject by the members. The President of the Institute, Mr. Hallidie, called the meeting to order, and H. J. Holmes was elected Secretary. The Chairman briefly stated the object in calling the meeting, and called upon gentlemen present to give their views. The aim and scope of such polytechnic societies as those connected with the American Institute at New York, the Franklin Institute at Philadelphia, and the Polytechnic School of London, were presented by different gentlemen. The agreement seemed general as to the necessity for such an institution and the desirableness of having it organized at once. Several gentleman spoke upon the subject. On motion a committee of five were named by the Chair, to report a plan of organization and by-laws, on Tuesday, Dec. 22d. On motion, the Chairman was added to the committee. The Committee stands as follows: A. S. Hallidie, W. F. Herrick, John J. Hucks, A. T. Steen, J. H. Culver and Amos Bowman.—*Bulletin.*

Sheffield Scientific School

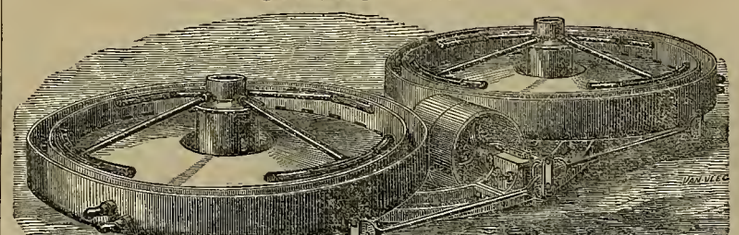
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.



Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.

Or M. HUNGERFORD, at the Pacific Iron Works.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the **6th, 14th, 22d** and **30th** of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR DECEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

December 5th—MONTANA.....Captain West, Connecting with ALASKA, Capt. Cray.

December 14th—CONSTITUTION....Capt. Wm. H. Hudson Connecting with RISING STAR, Capt. King.

December 22d—GOLDEN CITY.....Capt. J. M. Cavarly, Connecting with HENRY CHAUNCEY, Capt. Connor.

December 30th—COLORADO.....Capt E. S. Farnsworth, Connecting with ARIZONA, Capt Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S Doane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for mouths, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.

New Incorporations.

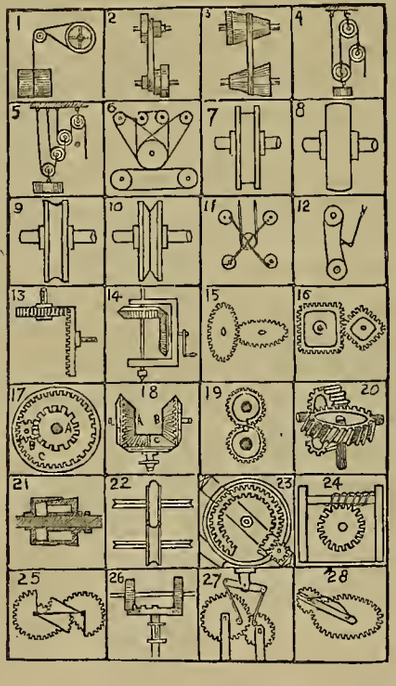
Disinfectants.

There seems to be a difference of opinion among us in regard to the question, what is the best disinfectant for common use during the prevailing epidemic? "One who knows," recommends the sprinkling about of sulphate of iron (copperas) in solution; another who knows suggests concentrated acetic acid; another insists that permanganate of potash is absolutely infallible. But besides these, there are two substances, each of which has claims, which are urged by a legion of advocates; and it is hard to say, perhaps, which party has the best of it. These are *chlorine* and *carbolic acid*. They are employed in various forms. The first, chlorine, either as chloride of lime, moistened with water, and placed in the room to be purified; or as chloride of soda, (Labarraque's solution), sprinkled around the room; or as chlorine gas, prepared by pouring sulphuric acid upon a mixture of peroxide of manganese and common salt. The latter substance,—chloride of sodium,—is decomposed; soda combines with the acid, and the chlorine, is set free and escapes in the form of a most pungent and searching gas. The second of the substances named, carbolic acid, is used either in the form of solution in water, or as creosote,—which is essentially the same thing, although not chemically identical with it,—or as carbolate of lime. As a disinfectant, many persons insist that it is unequalled. They declare that a drop or two of carbolic acid will, for instance, effectually and permanently destroy all odor from a decomposing rat; while chlorine will merely *overcome* the odor by its superior pungency, and that for a time only,—the odor becoming as strong as ever, as soon as the gas is dissipated. Of these two disinfectants, the chlorine is the one which is advocated and employed by our Health Officer; and his opinion and practice is concurred in by many physicians of reputation. We are inclined, for our own part, to follow suit, and we therefore recommend the general use of chlorine in some form, until the plague is stayed.

A COMMUNICATION from Boise City, Idaho, has been received, and will appear in our next issue.

Mechanical Movements.

The simplicity of the little devices by which man accomplishes his great results,—more wonderful than those of magic, more imposing to man himself, and more colossal than the vaunted deeds of mythological gods,—is exemplified by an elementary table of mechanical movements. What matters it whether we are small and weak, born without terror-inspiring appendages and instrumentalities, offensive or defensive, unprovided with Jove's power to command and be instantaneously obeyed, so long as we attain the same ends by ingenuity, and by the exercise of the power of will?



The following illustrations and descriptions, with additional ones which are to be given in succeeding numbers, have been compiled from different sources, chiefly from Brown's "507 Mechanical Movements":

1. A method of transmitting motion from a shaft at right angles to another, by means of guide-pulleys. There are two of these pulleys, side by side, one for each leaf of the belt.

2. Speed-pulleys used for lathes and other mechanical tools, for varying the speed according to the work operated upon.

3. Cone-pulleys for the same purpose as 2. This motion is used in cotton machinery and in all machines which are required to run with a gradually increased or diminished speed.

4. Known as Spanish bartons.

We find it instructive to dissect, and to analyze great things, in order that we may learn how insignificant, after all, are the elements and the several successive movements by whose combination they have been attained. We learn to understand the nature of things by generalizing; we proceed to accomplish things by organizing, and combining. As it is always by a combination of circumstances and conditions that great events, as well as great things, are produced, so it is by a combination of but few and simple mechanical movements and conditions of matter, that our mechanical wonders, the triumphs of advanced civilization, are accomplished. And by the same law it is *combinations* that are recognized by the Patent Offices, in regard to inventions.

We cannot define where is the end of Invention. It is as infinite as the variety of the universe, and as unlimited, regarding the great results that we are yet to accomplish, as the god-like and unknown destinies of man.

5. Different arrangements of pulleys. The following rule applies to these pulleys: In a system of pulleys where each pulley is embraced by a cord attached at one end to a fixed point and at the other to the center of the movable pulley, the effect of the whole will be = the number 2, multiplied by itself as many times as there are movable pulleys in the system.

6. Belts and pulleys.

7. A flanged pulley to drive or be driven by a flat belt.

8. A plain pulley for a flat belt.

9. A concave-grooved pulley for a round band.

10. A smooth surface V-grooved pulley for a round band.

11. Several wheels, by connecting rods driven from one pulley.

12. Lever with bearing roller to tighten pulley bands.

13. The wheel to the right is termed a "crown-wheel;" that gearing with it is a spur-gear. These wheels are not much used, and are only available for light work, as the teeth of the crown-wheel must necessarily be tilted in.

14. Boveled gear.

15. Elliptic gears.

16. Rectangular gears. These produce a rotary motion of the driven gear at a varying speed. They were used on a printing press, the type of which were placed on a rectangular roller.

17. Different velocity given to two gears, A and C, on the same shaft, by the pinion, D.

18. A uniform intermittent rotary motion in opposite directions is given to the bevel-gears, A and B, by means of the mutilated bevel-gear, C.

19. Scroll-gears for obtaining a gradually increasing speed.

20. Oblique toothed wheels.

21. Friction cones. (Sectional view).

22. Friction pulleys.

23. Revolving into reciprocating motion, by an endless segmental rack and pinion, the axle of which revolves and slides in a slot toward and from the rack. This rack is secured to a disk, and a rope round said disk extends to the body, to which a reciprocating motion is to be imparted.

24. Worm and worm wheel.

25. Transmitting motion from one axle to another, with three different velocities, by means of toothed segments of unequal diameters.

26. Intermittent revolving motion to a shaft with two pinions, and segment gear wheel on end of shaft.

27. Reciprocating motion to a rod. The wheels are of different diameters, and consequently the rod has to rise and fall as the wheels revolve.

28. Revolving motion by a circular sliding pinion gearing in an elliptical cog-wheel.

ORGANIZATION OF A POLYTECHNIC SOCIETY.—Further steps for the organization of a polytechnic society under the patronage of the Mechanics' Institutes (though in reality to be as far as possible on an independent basis), are to take place at the Mechanics' Institute on Tuesday evening, when the committee appointed at the last meeting will report. The idea of the American Institute Polytechnic Club, which has benefited all classes interested or concerned in the useful arts by bringing into communion the practical talent and ingenuity of the country without dabbling in the unapplied sciences, is to be carried out for this coast; combined with the original idea of the English and Scotch Mechanics' Institute, and of the very successful London Polytechnic Institute, that of encouraging and facilitating the delivery separately of popular lectures on scientific subjects; besides which provision is proposed to be made according to the demand for the education of young persons in the technical and industrial branches. Concerning the necessity for some such live organization, to sustain regular meetings, and to concentrate as much information and talent as possible to a proper and enlightened solution of the industrial problems of this coast, independently and significantly situated as we are with regard to the rest of the world, nothing need be said, or can be more conclusive or eloquent, than a simple statement of the objects themselves. That San Francisco has enough intelligent mechanics and scientific men of the practical sort, to sustain a very creditable polytechnic society, has been evidenced by the attendance and interest shown at the first meeting held a fortnight preceding.

Engineering.

[Written for the Mining and Scientific Press.]

N. Y. Society of Practical Engineering.

This Association met as usual on the evening of Tuesday, the 24th of November, at the Cooper Institute, New York city, James A. Whitney, the President, in the Chair.

Mr. T. P. Pemherton, of New York, read a paper upon the stated subject for the evening, viz: "Elevators and Hoisting Machinery"; in which, after an elaborate exposition of the construction of this class of devices from early periods up to the present time, he proceeded to sketch, hy the aid of drawings, the prominent characteristics of the more important varieties of this class of mechauism now in use.

Speaking of the windlass, in its primitivo form, he stated that it could still be found, in all its primitive simplicity, on Chinese junks, and had been in use in tho English merchant service less than one hundred years ago; hut of late years has of course been very much improved upon, principally hy the addition of the so-called friction pawl, by means of which the slippiug hack of the cable strained around the windlass is effectually prevented, and accidents to the operators and waste of power is provided against in a very high degree.

Of hoisting cranes it was stated that the availahle power of one man workiug at the winch ten hours per day, and moving the winch at the rate of two hundred and twenty feet per minute, amounts to only about fifteen pounds. The more extended employment in industrial estahlishments of this variety of apparatus, was strongly urged, especially with reference to those cranes working on trucks and knowu as traversing cranes. One of these used in locomotive works in England has heen used to lift a finished locomotive into the air and move it over twelve or fourteeu others, quite to the other end of the workshop.

The writer classified the apparatus commonly known hy the distinctive name of elevators and used in mines and buildings, into several subdivisions, among which may he noticed the vertically-moving elevators operated hy steam or hand power. Those moving on inclines and worked either by ropes or through the agency of compressed air, and those employed in grain mills, and the like. Of those used in buildings for elevating persons and goods, the majority are worked either hy hemp or wire rope, or hy means of screws or spiral gears. The former means of raising the platforms are liahle to give way, either from the ahrasion of the hempen fihers upou each other when hent in passing over the hoisting pulleys, or in the case of the wire rope, under the same conditions, hy the destruction of the fihrous nature of the metal. The catch-pawls, commonly employed in this description of elevators to stop the downward movement of the platform in case of the hreakage of the draught rope, are frequently of no avail, the platform acquiring such velocity before the pawls can catch in the ratchets, that the pawls are hroken and rendered useless. The writer also described, by the aid of drawings, the several varieties of elevating apparatus more commonly employed in warehouses, hotels, etc.

At the close of the paper, Dr. A. W. Hall explained a method of raising heavy masses of stone, which he supposed to have been used by the ancients. In this the stone is tilted alternately upon two fulcra placed under its center, and hut a slight distance apart, each fulcrum heing made successively a little higher as the stone is lifted from it. It was stated that in old times men were trained to walk from one end of the stoue to the other to give it the regular tilting movement.

Mr. L. Holms explained an English elevator in which two sets of platforms are worked alternately up and down by a crank motion from a steam engine. The platforms move up and down the distance of one story, so that hy stepping to and fro from those of one series to those of the other, a person may take advantage of the upward movement of each, aud he thus raised to the top of a huilding, or to auy intermediate story.

According to the rule, permittiug a hrief explanation before the society of uew and useful improvements, Mr. Manner, of New York city, exhibited his improved Arion piano forte, the essential feature of which lies in a peculiar construction hoth of the iron frame and the rest-plank, hy which great volume and brilliancy of tone is secured, as well as great permanence in the tuning of the instrument. Mr. Frederick R. Pike explained his new system of propulsion for steam vessels, which iucludes the use of pistons actiug upou the water at the stern of the vessel, aud designed to avoid the slip aud lift, and cousequent waste of power which occurs with the use of paddle-wheels.

At the next meeting the suhject of "Modern Improvements in Mining Apparatus," will he considered.

San Francisco Water Supply.—Though water is hrought from a great distance dowu in the San Mateo Coast Range, and ahout all the available sources within reach south of the Golden Gate are tapped for the henefit of the metropolis, it appears that our water supply is yet limited; so that in case of a great fire we should he obliged to take to the Bay for a sufficient supply. The Market street main is only eight inches diameter; and such streets as Montgomery and Kearny, have only six-inch maius, while iu other streets the pipes are from six to two inches. It is found in practice that such a service is quite iusufficient to keep our preseut force of engines supplied. A company exists which was incorporated for the purpose of hringing water from Tamalpais; hut as there is not much water there, the scheme has been deemed by many impracticahle. Another and ample source of supply, to he resorted to when San Francisco doubles or trebles in size, is Monte Diablo, where San Ramon, Amador, and other creeks, afford more water than will be needed for all time.

Coffer Dam and Sea Wall at Fort Point.—The surf at Fort Point has heen nnusually severe recently, throwing its spray higher than the top of the Fort, and the heavy blocks of granite which protected the foot of the dam having heen removed for use in the sea wall in its rear, the sea has undermined about 100 feet of the former, and it was expected that the whole of it would he carried away during the winter. This dam, which is 600 feet long, has served its purpose, but it is so strougly put together that it does not pay to attempt to save much of the material used in its coustruction.

Tunneling with Giant Powder and Gunpowder.—At the New Almaden mine, recently, comparisous were made in tunneling with the aid of giant powder and the ordinary gunpowder, which resulted, according to a certificate of the company, in a cost of $45.45 per cuhic yard with the former, and of $65 with the latter—a difference of $19.55. At the same time it is claimed in favor of the giant powder that the smaller hlasts and smaller drills required with their more powerful agent will save much labor in drilling aud in the reduced size of openings and passages uecessary.

Official Opening of the Suez Canal. The Imperial schooner Levrette has left Toulon for the Red Sea. She was to pass through the Suez Canal, and her trip was to be considered the official opening of the Suez Caual. She was to head a procession of yachts and pleasure hoats to the numhor, it is said, of a thousand.

Reduction Works in Colorado.

J. R. Snowden, in his report on the Mineral Resources of Colorado, writes:

The Georgetown Silver Smelting Works are in successful operation; and although the operations are chiefly confined to the reduction of the argentiferous galena ores, yet they have assayed most of the varieties of ores of the silver belt. In answer to my call upon Mr. John T. Herrick, the Superintendent of the company, he politely furnished me with a statement showing—1. The manuer of reducing the ores. 2. The names of the lodes, the location, width of pay vein and yield per ton of ores brought to the works for treatment. 3. The general assay value of ores reduced from July, 1867, to July, 1868. 4. The assays of other ores brought to the works for simple assay. 5. General prospects, and an estimate of operatious for the present fiscal year, commencing July 1, 1868. 6. The present activity of mining in the Argoutine and Griffith districts. 7. Some general remarks upon the silver regions of Colorado. I present Mr. Herrick's paper as part of this report. Some of the statements are known to me personally to he accurate, and all may be relied upon as comiug from an intelligent and well informed gentleman. The German reducing works of Messrs. Huepeden, Wolters & Co. are in successful operation. They use the smelting as well as the amalgamating process. The Washington Mining association are erecting mills in which the stamp process, and smelting with reverberatory furnaces will he used. The agent, Mr. George Stille, informed me that the works will have a capacity to reduce thirty tons of ore in twenty-four hours. The Baker Silver Mining Co. are erecting, and have nearly completed, an extensive mill for smelting the ores, and reducing by stamps and amalgamation.

W. R. Thomas, associate of Mr. Hollister on the *Rocky Mountain News*, furnishes the following valuahle information editorially:

Men used to he anxious to own mines. They are now in search of profitable mines. This question of profit is admirably settled by the operations of the reduction works. Remarks concerning them would naturally come last, but I place them first hecause I regard them as the most important.

"These reduction works must in the first place he set down as ridiculously small and inadequate. The general rule in our Territory has heen otherwise; but Goorgetown cau and does produce more ore than there are reduction works to handle. These works were erected here in the early history of the mines, and are on an exporimental rather than a practical working scale.

"The Georgetown Smelting Works have heen run this season for seventy days, less time of delays on account of repairs, etc. The company have paid the following prices in currency for various lots of ore as follows:

4½ tons	Terrible ore, at		$394 44	per ton.
1	" Hise	"	659 00	"
3	" Coin	"	546 00	"
5½	" Terrible	"	518 18	"
7	" Terrible	"	675 00	"
4	" Terrible	"	500 00	"
4	" Terrible	"	430 25	"
2	" J. J. Roe	"	560 00	"

These prices paid by the company show most clearly the richness of the ore, hut the amount of silver which was taken out of the different lots, I was not ahle to ohtain, as many of them were mixed in working. The only separate run I could obtain was twenty-one tons of ore from the Brown lode, which yielded $221.24 in coiu per ton. During the seventy days which the furnace was in operation, 101 tons of ore from various lodes were worked, and the total amount of silver shipped from the works was 20,000 ounces. For the average yield of the ores run, therefore, we have a small fraction over 198 ounces per ton.

Following are Mr. Thomas' remarks, bearing date Sept. 27, on the stamp mills of Gilpin County:

I was aware from the report that there was great activity among the mills of this county, but I have found far more than I had anticipated. It is something less than a year and a half since I was last here, and the change which has in that time taken place is most marked and encouraging. Then, all was stagnation and depression; now, everything is active and prosperous. Men are mining, milling, and making money; business is lively, and every one sees the dawn of better times. Iu the two days and a half which I have had to spend here—a ridiculously short space of time—I have visited all the mills to learn tho number of stamps ruuning, and the averago amount of oro heing crushed. The mines I did not visit, for I had not time. Iu fact, information coucerning milliug has heen less sought for, and is more needed by the puhlic than any long description. That tho miues aro here, and are rich, is a fact uever questioned. How to get the gold out of them, however, has heen tho question for years. Whether it will remain so, much longer, is doubtful. Stamp mills were once ahandoned, hut stamp mills are now making money, aud I believe could have been doiug so all these long years of dullness—if people had only thought so. In making my ride through this section, I helieve that I have ohtained every mill that is now in operation. If any have been missed, it is hecause I could not find them, or my frieuds did not tell me where they all were. The following tahle is, I think, very nearly correct:

STAMP MILLS IN OPERATION.

Mills.	Number of Stamps.	Cords of Ore Crushed per week.
Peregrine's	12	6
New York	33	24
Dickinson's	15	9
Black Hawk	80	35
Miller & Buffington's	12	8½
Fitzpatrick's	10	7
Hurd's	20	14
University	15	9
Miley, Sanderson & Co's	13	8
Douglas	20	12
Sterling	23	8
Terry Smith & Co's	20	12
Briggs	50	20
La Crosse	12	3½
Conlee's	18	7
Ophir	24	14
Philadelphia	25	16
Kanzas-Colorado	12	6½
Stoner's	12	6
Pacific National	24	12
Mansur's	12	6½
Clayton	9	4½
Beverly	9	8
Whitcomb's	12	7
North Star	17	8
Alps and Granada	12	4
Montana	15	10
Lexington	24	12
Sensenderfer	20	6
Narragansett	40	20
Delaware	20	9
Kip & Buel's	12	7
Wilson's	15	8
Cheney's	12	6½
Brastow's	20	8
J. Toscher's	12	7
Kimber's	12	8
Barret Co's	20	15

"The totals of these figures are as follows: Mills, 38: stamps, 745; ore crushed, 392 cords per week. Estimating 7 tons to the cord, we have 2,744 tons; whilo estimating 8 tons to the cord, we have 3,136 tons. I give each estimate, because there is a difference of opinion among millmen as to what a fair average is, as different ores vary. The majority, however, say 8 tons to the cord, and on this basis I shall therefore figure. The tahle given is in itself a proof of the activity of Gilpin County. Millmen inform me that the supply of ore is ahout sufficient to keep their stamps running, but as yet there has heen no surplus. Thus far the supply has been equal to the demand. In anticipation, however, of a large supply of ores, a numher of new stamp mills are being erected, and will be completed during the coming season, by the following parties: J. Sensenderfer, building (stone) 40x60, 40 stamps—probahle cost, $15,000. Miley & Ahlie, building 50x50, 25 stamps—probable cost, $10,000. Lake & Fields, building 30x40, 25 stamps—prohable cost, $10,000. Nesmith & Co., building 36x36, 20 stamps—probable cost, $10,500. New Beverly Mill, building 30x40, 12 stamps—prohable cost, $5,500.

"Besides these are the new mills of tho Consolidated Gregory and Smith & Parmelee Companies, which will be noticed hereafter.

A Nut for "Caxton" to Crack.—Those theorists who maiutain that it is not the *earth* which quakes,—hut the thiugs *upon* the earth,—in the little "onpleasantnesses" such as we felt on October 21st,—may perhaps find a difficulty in making the following facts fit neatly iuto their "electrical" explanation of the phenomena: In 1822, in a single night (Nov. 19), the whole coast line of Chili for a hundred miles about Valparaiso, with the mighty chain of tho Andes, was hoisted at one shock from two to seven feet ahove its former level, leaving the beach *below* tho old low-water mark high and dry. In 1819, iu an earthquake in India, in the District of Clntch, hordering on the Indus, a tract of country more than 50 miles long aud sixteen hroad, was suddenly raised ten feet ahove its former level. And again, in 1538, in the convulsions which threw up the Monte Nuovo, the whole coast of Pozzuoli, near Naples, was raised twenty feet above its former level, and remaius so permanently upheaved to this day.

New York Schools.—The Board of Education of New York city have resolved that hereafter mechanical and free-hand drawing shall he taught in every grade of the puhlic schools.

Mechanical.

THE ARTUS MORTAR.—The *Iron Age* describes the manner of preparing the new mortar invented by Dr. Artus, in which the silicates, to which all mortar owes whatever firmness it may have, form more rapidly and completely than in any before known. Well slacked lime is carefully mixed with finely sifted sand. Then fine unslacked lime is added to the amount of one quarter as much as that of the sand used. The whole is mixed thoroughly; during which operation the mass heats, and must be used immediately. It becomes very hard in a short time. The writer says: "An experiment known to us, yielded the following result: One part of well slacked lime was carefully mixed with three parts of fine sand, and just before using, three quarter part of fine unslacked lime was added, and the whole then thoroughly mixed. The mortar thus prepared was used in building a foundation wall, and after four days became so hard that a pointed iron could not be driven into it; it clung with equal tenaciousness to the stones of the wall. After two months the mortar was just as hard as stone. We have then, here, a very valuable discovery under consideration, which must also be of great account from an economical point of view, when the high price of cement is remembered."

PNEUMATIC RAILWAYS.—Mr. P. Dickson read a paper, Oct. 13th, before the Society of Practical Engineering, of London, Eng., in which,—after referring to the various plans for atmospheric propulsion, which have been proposed and adopted at different times, and noticing their defects,—he referred to a plan of his own, which combined some of the features of the old plans with new applications and a device for easy compression and propelling power. It consists in a tube laid the whole length of the road, which is connected at the termini and at suitable intervals along the line of road with pumping engines, which condense the air into large stationary reservoir tanks, to which the pipe is connected by branch pipes, and supplying tanks located under the seats of the car or any convenient place. This plan is adapted to elevated as well as underground railways.

CONSUMPTION OF SMOKE.—The London *Mining Journal* says: A simple and efficient arrangement for the prevention of smoke is being introduced extensively by the Manchester Association. The inventors state that they make a peculiar form of longitudinal bars (hollow), each of which, when in action, delivers into a chamber a continuous and strong current of heated air, making together an elaborate, uniform and powerful stream of oxygen. The flame and smoke have to pass through this, which comes from below, and acts on the flame like a concentration of about 24 blow-pipes. The smoke is burnt instanter, and that, too, before it can get six inches away from the fuel. All the ironwork is placed out of the reach of the concentrated action of the bars and consequent intensified flame while burning the smoke, so that renewals of any portion even of the ironwork are rarely necessary. The saving of coal is estimated at sixty tons per annum for a 40-horse power boiler.

THE KENNEDY CLOCK.—This new electric clock is thus briefly described by the *Scientific American:* The clock is impelled by the motion of the pendulum, and is of extremely simple construction. The pendulum ball contains a permanent maguet, which is alternately repelled by oblong helices placed on either side of it at a proper distance. The helices connect with a zinc and carbon earth battery, and the circuit is alternately broken by a commutator attached to the pendulum rod, which is of rosewood, baked, and saturated with paraffine. The clock will run without winding, or any other attention, after the primary adjustments are made.

THE ANGLO-FRENCH RAILWAY BRIDGE.—An iron bridge is to be constructed from Dover to Calais. It will be,—says the London *Mining Journal*,—32,822 yards in length, divided into ten arches of uniform span, resting on nine piers, rising to a hight of 360 feet above the sea, so as to allow of the free passage of ships of the largest class. The arches are constructed on a new system, by which absolute rigidity is secured by the use of wire cables and wrought iron—an ingenious and very simple system of scaffolding rendering the placing of the parts extremely easy. Metallic framework piers, with foundations about 400 feet long by 250 feet wide, and tapering to about 200 feet square at the top, are to be employed, the center pile being half as large again as the others. The piers are to be screwed down by seventy or eighty powerful screws, and are so arranged that they can be constructed on land, floated into position and fixed at once.

NEW STANDARD WIRE GAUGE.—The new "American" gauge of Brown & Sharpe, Providence, R. I., was exhibited and discussed at a recent meeting of the Franklin Institute. It seems to have been generally approved. The *Journal* of that Association says of it: "In this scale the starting-point is taken at No. 36, which represents a diameter of .005 of an inch, and this quantity being multiplied by .0503536, gives the next size, or No. 35, and this product being again multiplied by the same factor, gives the next, or No. 34, and so on for each successive size above, while the smaller sizes are obtained similarly by dividing .005 of an inch, and the quotients obtained successively by this same number. It will be perceived that the sizes vary in a regular geometrical progression, which produces a very gradual change in size for the smaller dimensions, but a rapidly increasing difference as the larger ones are reached; exactly what is demanded in practice.

UTILIZATION OF WASTE STEAM.—Herring & Co., of Chertsey, Eng., have patented an apparatus into which the steam from high-pressure engines is led and condensed,—passing thence in pipes through the buildings for the purpose of warming them. It is then led back into the boiler, still hot. Not only the water is mostly saved, but the fuel necessary to convert it again into power, is proportionately less. Moreover the condensed water, being pure, cannot produce any incrustation upon the boiler.

IRON-RUST PREVENTED.—Half an ounce of zinc dust mixed with one ounce of oil varnish, and rubbed several times upon one square foot of cast iron will preserve the metal from rust, unless it is to be exposed to soap water or other alkaline liquids. In that case, the iron must be coated with two parts of waterglass (silicate of soda), employed in solution, marking 20° Beaumé, and one part of zinc oxide intimately mixed together. This material, laid on as a thick varnish, gives the iron a kind of enameled appearance, and the protective coating will not yield to soap water.

NEW STEAM ENGINE.—Abraham Kipp, of Sing Sing, N. Y., has patented an improvement consisting in a certain combination of double pistons working in cylinders which are arranged radial to a central shaft and operating in a direct manner through yokes on or in connection with a crank secured to the shaft; also a valve having a fixed character relatively to the crank, whereby a most simple and efficient engine is produced and which may be used either as a motor for driving purposes, a pump, or a meter.—*Artisan.*

MAGNESIAN CRUCIBLES.—A French patent has been taken out for the manufacture of crucibles from magnesia. They are said not to be affected by any change of temperature. For the melting of platinum, etc., they are well adapted.

SOLDER FOR ALUMINUM.—A solder recently invented for soldering the metal aluminum is now coming into extensive use in the manufacture of dental plates from this material, and is found far superior to the silver solder ordinarily in use. It is composed of seven parts of aluminum and one of tin.—*Am. Artisan, Nov.* 18.

Scientific Miscellany.

PREVENTION OF MINE EXPLOSIONS.—A new method of destroying choke-damp by means of electricity has been submitted to the Paris Academy of Sciences by M. Delaurier. The inventor proposes to place copper conductors, of considerable thickness in the galleries; these are to be broken at intervals, and joined by means of very thin gold wire soldered to the copper, the gold wire to be surrounded by flowers of sulphur, which ignites readily. By passing a strong current of electricity through the conductors, the gold wire becomes red hot, the sulphur is iguited, and burns the mixture of air and other gases which may be present. By this means the circuit is never broken; and if an explosion of gases take place, it is shown by the fact of the sulphur being blown off. The electric current is to be made to pass through the apparatus every morning, before the descent of the miners, and by putting a few pinches of sulphur on the gold wire every morning, many lives may be saved.

THE ARCTIC EXPEDITIONS.—The *Germania* succeeded in reaching the high latitude of 81° 5 min. The attempts made to find an open polar sea were unsuccessful. The expedition was not, however,—it is said,—without valuable results. Important corrections have been made in previous charts.

The Swedish expedition is reported to have reached about the same latitude towards the end of August; but a week later the sea to the northward became clear of ice. The exploring steamer, after taking in coal, sent out for her use to Kobbe Bay, made again for the north, whether to pass a winter in the ice or not, is at present uncertain. Meanwhile, the coal-ship returns to Sweden, bringing five of the exploring party "with the rich geological, zoölogical and botanical collections" made during the first part of the voyage.

REACTION OF MERCURIC OXIDE ON ALKALINE SALTS.—In a paper recently published in *Annales de Chimie et de Physique*, M. Fonberg states that the muriates of the alkalies and alkaline earths are acted on by mercuric oxide; that by shaking their saturated solutions with it, or, still better, by boiling them in large excess with the oxide, they yield free alkali, readily distinguishable by the tests, as is likewise the presence of mercury in the resulting solution.

The same takes place in the case of chloride of ammonium; the action is accelerated by subjecting the solution and oxide to boiling in a retort, in which case an ammoniacal distillate will be the result, while the ammonio-chloride of mercury remains in the retort. With alkaline chlorides the process can hardly complete itself, owing to the reaction of the freshly formed caustic alkali on the mercuric chloride in solution, except with a large excess of the alkaline salt.

CEMENTS FOR THE CHEMIST.—Dr. Adolph Ott, of New York, gives the following recipes:

1st. Take of soapstone, 10 parts; sand, 30 parts; asbestos, 5 parts; oxido of iron, 5 parts; oxide of zinc, 50 parts; mix.

2d. Soapstone, 10 parts; sand, 30 parts; hydraulic cement, 5 parts; oxide of manganese, 5 parts; oxide of zinc, 50 parts; mix.

3d. Soapstone, 5 parts; sand, 35 parts; calcined magnesia, 10 parts; asbestos, 5 parts; oxide of iron, 5 parts; oxide of zinc, 40 parts; mix.

The materials for the above should be intimately mixed together, after having first been finely ground. When applied, the metallifrous mixture is made into a pasty mass with a solution of chloride of zinc of 25° to 35° Baumé. Too quick setting is prevented either by the addition of one or two per cent. of linseed meal, or a little ale or beer.—*Journal of Applied Chemistry.*

FORCEPS FOR LABORATORY USE.—David Forbes, F.R.S., describes a convenient forceps with glass tips for use in acids, etc. He cuts off the tips of a pair of strong surgical forceps, and solders on elastic slit brass cylinders, through which pieces of glass rod slide. These latter are flattened at their tips after softening in the flame.

Allotropic Forms of Metallic Arsenic.

The *Gas-Light Journal* of Nov. 16th gives the following by Prof. Wurtz, from the German of Bettendorff: Upon the sublimation of pure metallic arsenic in a quick current of hydrogen gas, there is deposited in the neighborhood of the heated point, metallic hexagonal arsenic, somewhat further on black amorphous arsenic, whilst the whole of the rest of the tube is filled with a clear yellow vapor, that quickly deposits, becoming dark yellow, and finally gray. This *gray* powder was proved to be the metal arsenic by oxidation with nitric acid to arsenic acid, yielding its equivalent of the latter. It was wholly amorphous, and consisted of globules strung to one another in a bead-like manner, exactly like freshly prepared flowers of sulphur. Density at 14° C., 4.71. At about 360° it suddenly passes, with an evolution of heat strong enough to sublime a portion, into crystalline arsenic of density 5.72. The *yellow* powder, which cannot be preserved permanently, passing into the gray condition, constitutes probably another special modification. Amorphous arsenic may be obtained as a black vitreous material by passing the vapor of arsenic, volatilized in a current of hydrogen, through a U-shaped tube immersed in an oil bath at 220°. Slight blows will detach the mirror-like crust formed. Synthesis into arsenic acid shows it to be the pure metal. Density, 4.71 to 4.716. At 360° it likewise passes, as the above, into crystalline arsenic of density 5.72. It withstands chemical agents much better than the crystalline metal. The latter loses its luster in a few hours in moist air, and is very easily oxidated by dilute nitric acid; whilst the amorphous black arsenic remains unchanged for weeks in moist air, and is attacked by nitric acid with much more difficulty. There can be little doubt that the familiar arsenic mirrors of Marsh's test are composed of this amorphous modification.

Prof. W. remarks: "It thus appears that the analogy between the two elements, arsenic and phosphorus, is remarkably exact in this respect. Each has a crystalline form, more or less easily attacked by the oxygen of the air and other agents; and an amorphous form, of comparatively difficult oxidation. Tempting subjects of speculation at once offer themselves here. Are we to find in the case of every elementary body, that these two opposite chemical conditions, the active and passive modifications, may inhere? In another group of the elements we have crystalline and amorphous sulphur, the one soluble, the other insoluble in bisulphide of carbon, and having other antithetical relations; oxygen and ozone; and other similar cases. The most special question that occurs, and one pertinent to the immediate subject is, whether we are not to look for and expect to discover these two opposite conditions in the other members of the elementary group which forms pentacids, to which arsenic and phosphorus belong; namely, nitrogen, antimony, and bismuth (to which we are now in all probability to add, according to the recent elegant researches of Roscoe), the as yet unknown element, vanadium."

DOES ICE EXPAND BY INCREASED COLD? To prove the affirmative, Prof. Tyndall fits bands of cast iron around blocks of ice, and places them in a freezing mixture. The bands burst. Others argue that this effect is due to the contraction of the hands, and not to the expansion of the ice; and instance the cracking open of large ice surfaces during a night of severe cold. "Who shall decide when doctors disagree?"

A NEW BATTERY.—A new voltaic combination of great power,—says the *Telegrapher*,—has been invented by Messrs. De La Rue and Hugo Miller. The elements consist of small cylinders of pure zinc and chloride of silver. The latter is cast upon a thin silver wire, which forms the conductor. The exciting liquid is merely a dilute solution of common salt.

In the battery shown the cylinders were only three inches long, and about the size of a goose quill, arranged in two ounce phials cut down to two-thirds of their length, but a series of ten such couples decomposed water with great rapidity. By the chemical action taking place in the cell, the chloride of silver is reduced and chloride of zinc formed. The action proceeds so long as any chloride remains, for the reduced silver adheres to the wire as a spongy mass, which allows the liquid to permeate to any unreduced chloride.

Educational Institutions of the Pacific Coast.

Not a few persons of sterling moral weight and worth are laboring in the educational institutions of the Pacific Coast. To their veiw the field, in the main, is one of hope; their study, and the results of their labor, relate to the future, when younger hrains shall rule the situation. Frequently under-appreciated, their cause and their element of feeling are yet well worthy of our interest. We therefore append a list, as perfect as we have heen able to make it with the resources at hand, of the leading educatioual institutions of the coast, omitting the common and higher puhlic schools. For portions of the information we are indehted to Rev. B. P. Veeder, President University College; O. P. Fitzgerald, Superintendent of Puhlic Instruction; John T. Barry, editor of the *Monitor;* Señor Marsilino Martinez, Attorney at Law (late of Mexico); and Rev. R. J. Whyte, of St. Ignatius College.

IN SAN FRANCISCO.

University College. Located at University Mound (near Bay View Park, heyond the Mission). City department, on Stockton street, near Union Square. Rev. P. V. Veeder, A.M., Acting Presideut, and Professor of Moral and Mental Philosophy; Rev. Thomas Kirkland, A.M., Professor of Latin and Greek; Thomas A. Rohinson, Professor of Mathematics and Book-Keeping; G. C. Arnold, Ph. D., Professor of Physics and Modern Languages; A. Coulon, Professor of French and Drawing. School of Practical Chemistry and Assaying, Thos. Price, M. D., Professor of Chemistry. Average attendance, about 130 students.

St. Ignatius College, Market street. Sustained by the Jesnit Fathers, having been established by the agency of fuuds sent from Italy. V. Rev. N. Congiato, S. J., President; Rev. C. A. Barchi, S. J., Prefect of Studies—Professor of French; Rev. Jos. Tadini, S. J., Professor of Logic, Metaphysics, Ethics and Chemistry; Rev. E. Messea, S. J., Professor ol Natural Philosophy and Chemistry; Rev. D. Maraschi, S. J., Treasurer, and Professor of Mathematics; Rev. M. O'Ferrell, S. J., Professor of Classics, Rhetoric, Poetry, and Astrouomy; Rev. F. Sullivan, S. J., Professor of Classics and Arithmetic; Rev. J. Buchard, S. J., Chaplain; Rev. R. J. Whyte, S. J., Rev. J. Affrachino, S. J., Mr. J. W. Lannon, Professors of Latin, Greek, English, Arithmetic, History and Geography; Mr. J. O'Donoghue, Professor of Commercial Course and Penmanship, English Grammar and Arithmetic; Mr. J. P. Camphell, Mr. J. O'Dwyer, Teachers in the Preparatory Department; Mr. J. Egan, Teacher in the Elementary Department. Attendance, total, ahout 400. Terms, per month, from $3 to $5.

St. Mary's College, Bernal Heights (four miles south of the city). Boarding school, sustained by the Society of Christian Brothers—who are not ordained priests, but devoted to a particular cause. Brother Vincent, President. Attendance, 95, and increasing. In San Francisco, Father Justin is Principal. There is a corps of five instructors.

Presentation Convent School, for girls. Mother Mary Therese Comerford, Principal. Attendance in 1867, 879.

University School, Post street. Principal, George Bates, A.M.

Union College, corner of Second and Bryant streets. Boarding and day school. Dr. Huddart, Principal. Sustained by the Episcopalians. Formerly this school had quite a number of students from Mexico.

City Female Seminary, on O'Farrell street. Principal, Rev. C. R. Clark.

Sisters of Notre Dame, at the Mission.

Grace Female Institute, No. 618 California street. Miss D. S. Prescott. (Episcopal.) Attendance in 1867, 71.

Home Institute, No. 218 Eddy street. Miss J. G. Prince.

There are a number of generally small private schools, kept by foreigners to some extent, iu which French, German, etc., are taught. Special instructions in various arts and professious are also given by private individuals. Amongst these are the drawiug, fencing, dancing, and hoxing schools,—too numerous to mentiou,—aud several assaying and metallurgical establishments where instruction is given.

Schools in the mechanical trades have not yet been inaugurated in this country, though they are operating with great success in some European countries where the laws concerning apprenticeship are far more strict than they are in America, and the necessity, consequently, for such instruction, to those who would become masters in their trade, less urgent than it is here. The only distinct public professional schools are:

Toland Medical College, located near North Beach. H. H. Toland, M. D., Presideut. Professors: James Blake, M. D., L. C. Lane, M. D., J. F. Morse, M. D., Thomas Bennett, M. D., Henry Gihhons, M. D., Thomas Price, M. D. Students in attendance in 1867, 34.

The California Business University, 424 Montgomery street. E. P. Heald, President, Superintendent of the Course of Instruction, and Lecturer on the Science of Accounts; James L. Fields, Principal of the Practical Department, Professor of Plaiu and Ornamental Penmanship, aud Lecturer on Business Correspondence and the Customs of Trade; F. C. Woodbury, Principal of the Theoretical Department, and Instructor in the Science of Accounts and Commercial Calculations; W. A. Perkins, Assistant Instructor in Book-keeping and Arithmetic; P. O. Sullivau, Superintendent of Telegraphic Department; D. M. Knowlton, Professor of Phonography; J. P. C. Allsopp, Professor of Modern Languages.

Pacific Business College, Mechanics' Institute Building, Post street. A. de Laguna, President; James Vinsonhaller and Messrs. Sereni, Julian, Day and Shear, Instructors.

Specially worthy of mention in this connection are the puhlic—

Boys' High School, Theodore Bradley, Principal; A. T. Winn, J. M. Sibley, A. L. Mann and Mrs. C. L. Atwood, Assistants.

Girls' High School, Ellis H. Holmes, Principal; Mrs. Caroline R. Beals, Miss E. A. Cleveland, Miss S. A. Barr, and Madame V. G. Brisac, Assistants.

State Normal School, Market street. W. T. Lucky, A.M., Principal; Henry P. Carleton, Miss E. Houghton and Mrs. D. Clark, Assistauts. Attendance, 125.

Schools for the Education of Chinese in this city are kept by the Rev. Mr. Loomis, in connection with the Preshyterian Mission, and hy the Rev. Mr. Gihson, in connection with the Methodist Mission, both being well attended. The inducement to the Chinaman is, that a little kuowledge of English enahles them the more readily to "turn a penny." Amongst the Chinese themselves, instruction is given privately, hy individuals depending entirely upon their personal reputation and acquaintance.

AT OAKLAND, ETC.

College of California—about to be merged into the State University. The old faculty and instructors consist of S. H. Willey, Presideut, Rev. Martin Kellogg, Professor of Languages, Rev. Henry Durant, Professor of Ancient History, in the Preparatory Department, separately known as the College school; Rev. J. H. Brayton, A.M., Principal; Rev. H. Beckwith, Associate Principal; Fred. M. Camphell and W. C. Dodge, Assistants; G. Copenhagen, Paul Garin and A. D. A. Champion, instructors in Foreign Languages. Attendance in College school, 160; yearly expense per pupil, $300.

State University, at Berkeley, near Oakland —named after Bishop Berkeley, who, iu the last century, immortalized himself by writing the poem,

"Westward, the star of empire makes its way."

The State University is not yet fully organized, and will not be opened before September, 1869. It is in charge of a Board of Regents, consisting of Messrs. Haight, Hager, Holden, Fitzgerald, Ryland, Hammond, Archer, Parker, Butterworth, Doyle, Watt, Moss, Dwinelle, Stebbins, Felton, Hallidie, Ralston and Reed. No President has been elected yet. The only Professors elected are the brothers Le Count, of South Carolina, on Natural History, Geology and Chemistry, and Dr. Fisher, of Grass Valley, on Mining and Metallurgy. The College of California will he gradually aud entirely merged into the State University.

Oakland Seminary for Young Ladies, Oakland. Mrs. G. M. Blake, Principal. Miss Julia A. Rappleye, Miss Matilda Lewis aud Miss Susie N. Jewett, Assistants; W. Schraubstadter, Music; Mlle. Hermet, Modern Languages. Attendance, 100.

Female College of the Pacific, Oakland. Rev. E. B. Walsworth, Principal; Prof. D. C. Stone, Assistant. Attendauce, 100.

Sisters of Notre Dame, institution for females.

Rev. David McClure's Classical School, near Oakland. Eighty pupils.

Union Academy, at San Ramon, Contra Costa Conuty. Prof. King, Principal. (Cumberland Presbyterian.) This institution was recently burned down, but is to be rebuilt without delay.

SOUTH OF THE BAY.

Santa Clara College, (Romau Catholic), Rev. A. Varsi, S. J., President and Prefect of Studies; Rev. Joseph Caredda, S. J., Vice-President aud Prefect of Classes; Rev. C. Pollanno, S. J., Professor of Divinity; Rev. A. Brunengo, S. J., Professor of Natural Philosophy and Elementary Chemistry; Rev. Joseph M. Neri, S. J., Professor of Analytical Chemistry and Mineralogy; Rev. F. Veyret, S. J., Professor of Mathematics and Mental Philosophy; Rev. E. Young, S. J., Professor of English Literature aud Arithmetic—Chaplain. Rev. S. Traverso, S. J., Professor of Ancient Languages and French; Rev. E. M. Nattini, S. J., Mr. B. Mahon, Mr. D. O'Counell, Professors of English aud Elocution; Mr. P. A. Barcelo, S. J., Professor of Mathematics and Spanish; Rev. G. Mengarini, S. J., Treasurer; Rev. F. Prelato, S. J., Assistant Treasurer; Rev. A. Guerrieri, S. J., Disciplinarian; Mr. J. Pascal, Professor of Mathematics, Book-Keeping, German, Drawing and Violin; Mr. J. Lawrie, Professor of Piano; Mr. E. Vile, Assistant Professor of Piano; Mr. L. Fernandez, Professor of Penmanship; Dr. H. H. Warhurton, Atteudiug Physician; Mr. J. Boggio, S. J., Infirmarian. There are moreover five Assistant Disciplinarians and Teachers. Attendance—boarders, 162; day scholars, 29; total, 191. Terms for boarding, lodging, tuition, washing and mending of lineu, school stationery, viz., paper, ink and pens; medical attendance and medicines, fuel, light, baths, etc., per session of teu months, $350. If more than two hrothers enter the College, each additioual one pays only $200 per session.

University of the Pacific, (Methodist) for hoth sexes, Santa Clara. Rev. T. H. Sinex, D. D., President; Milus H. Gay, A. M., Ancient Languages; L. H. Van Schaick, English Department; L. J. Megerie, Book-keeping and Grammar. Attendance—males, 67, females, 79; total, 146. Yearly expense per pupil $320. Library, 1,200 volumes.

Female Collegiate Institute, (Methodist Episcopal), Sauta Clara. Rev. D. Tuthill, Principal; Mrs. C. V. W. Tuthill, Preceptress; Miss H. S. De Lamater, French and German; Miss L. N. Widney, English hranches; H. M. Gay, Ancieut Languages; George M. Shuck, Music. Attendance, 79; expense per pupil $300 to $340.

Academy of the Sisters of Notre Dame, for youug ladies, San José. This is the parent establishment of a numbèr of similar institutious in differeut parts of the State. There is a hranch at Santa Clara.

The Sisters of Charity have educatioual institutions at San Juan, and Santa Cruz; also on Market street in San Francisco.

San Jose Institute, at San José, for hoys and girls. George E. Houghton, Principal.

Boarding and Day School, at Watsonville. Prof. William Van Doren, Principal.

Boarding School at Santa Cruz. Mr. Pioda, Principal.

High School, at Los Angeles. Dr. T. H. Rose, Principal.

A seminary is in contemplation at San Buenaventura.

St. Vincent College, at Los Angeles. Rev. Thomas McGill, President. Attendance, 120.

Institution of the Christian Brothers, at Santa Inez, Santa Barhara County. Brothers Doven and Nolan, Principals.

Franciscan College, in the town of Santa Barhara, (Order of St. Francis). B. Sheehan, President. Attendance, ahout 65.

NORTH OF THE BAY.

Pacific Methodist College, (for both sexes), Vacaville. Rev. J. R. Thomas, D.D., L.L.D., President, Moral and Intellectual Science; Charles S. Smith, Mathematics; Rev. John C. Simmons, English Literature; F. A. Thomas, A. M., M. D., Latin and Greek; J. M. Kirkpatrick, Primary Department; Miss Mary E. Thomas, Assistant; Miss Alice Ridge, Music. Attendance, 209. Tuition per annum, $30 to $80; board $5 per week.

Sonoma College School, (Cumberland Presbyterian), Sonoma. Rev. W. N. Cunningham, Principal; Z. J. McConnell, Assistant; Miss E. A. Abbott, Assistant. Attendance, 75.

Petaluma College School, (Baptist). Mark Bailey, Principal. Attendance, 83. Yearly expense per pupil, $300 to $380.

Institution at Petaluma, under the care of Prof. E. S. Lippitt.

Napa Collegiate Institute. Professor W. S. Turner, Principal. Attendance, 125. Cost per student, $300 to $400.

Young Ladies' Institute, at Napa, under the care of Miss McDonald and sister.

Benicia Young Ladies Seminary, formerly under the charge of Miss Atkins; now in the hands of Rev. C. T. Mills and Mrs. Mills.

Academy of the Dominican Sisters, at Benicia. Sister Maria Thomas Golden, Principal.

Alexander Academy, at Healdshurg. Rev. Mr. Wells, Principal.

IN THE VALLEY OF CALIFORNIA.

Hesperian College School, ("Disciples or Christian Church"), at Woodland, Yolo County. J. M. Martin, A. M., Principal; G. N. Freeman, Principal Preparatory Department; Professor Hollo, Music Department. Attendance, 120.

Sacramento Young Ladies' Institute. Rev. W. S. Hunt, Principal.

Select School for Girls, at Sacramento. Rev. Mr. Perry, Principal.

Marysville Young Ladies' Seminary, Mrs. Poston's.

Sisters of Notre Dame, at Marysville. Ditto at Grass Valley.

Stockton Seminary, for both sexes, (Episcopal). Formerly in charge of Prof. Van. Doren.

Visalia Select Seminary. Prof. S. G. Creighton, Principal; Prof. Thomas Howell, Assistant. Attendance, 90.

We shall extend this article next week, mentioning schools in Oregon, Mexico, etc.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

MECHANICS' REAL ESTATE AND BUILDING ASSOCIATION.—San Francisco. Dec. 11th. Capital stock, $50,000; 100 shares, $500 each. Trustees: A. J. McLellan, W. Irvine, James Best, Matthew Rodgers, R. A. Roscoe, James Lyons, T. F. Kenney, Johu Doyle, A. S. Dunlavy, John Sparro, and J. Britton.

ORR MINING CO.—Tuolumne County. Dec. 11th. Capital stock, $200,000; 2,000 shares, $100 each. Trustees: Camilo Martin, W. Fishel, R. C. Atkins, P. G. Venard, and R. Wegener.

AURORA CONSOLIDATED SILVER MINING CO.—White Pine, Nevada. Dec. 11th. Capital stock, $1,600,000; 16,000 shares, $100 each. Trnstees: Frank Livingston, Thomas Bell, J. W. Crawford, J. D. Fry and Frank Drake.

VENUS GOLD AND SILVER MINING CO. Butte County. Dec. 15th. Capital stock, $500,000; 5,000 shares, $100 each. Trustees: Ebenzer H. Shaw, W. Barling, and James W. Barling.

CALIFORNIA WHITE PINE MINING CO.—White Pine, Nevada. Dec. 15th. Capital stock, $1,500,000; shares of $500 each. Trustees: Lafayette Maynard, Isaac Freidlander, Lester L. Robinson, Charles J. Brenham, D. W. Connolly, John S. Hager, and Lloyd Tevis.

TEACHERS' STATE UNIVERSITY HOMESTEAD.—San Francisco. Dec. 15th. Trustees: O. P. Fitzgerald, Alfred Stehhins, A. L. Mann, Hubert Burgess, George H. Burgess, James Stratton, and J. F. Bowman.

PACIFIC LIQUOR REFINERY.—San Francisco. Dec. 15th. Capital stock, $500,000; 1,000 shares, $500 each. Trustees: John Hewston, Jr., Chas. R. Peters, H. F. Teschmacher, J. T. Boyd, George Parker, John M. Duncan, and Wm. Harney.

THE success of the first masquerade and fancy dress hall of the Mercantile Library Association, and the general desire of the participants on that occasion, have induced the managers to announce a second, which will take place on Tuesday evening, December 22d. Every care has been taken to make the occasion as pleasant and the party as select as possible.

ATTENTION is called to the advertisement of Leopold Kuh, assayer and metallurgist (late of Virgiaia City) in another column. Mr. Kuh is the successor of Kustel in the office opposite the Mint.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

MR. MOWRY, lately a clerk in a hotel at Colfax, is requested to call at the office of the MINING AND SCIENTIFIC PRESS, No. 414 Clay street, below Sansome, San Francisco.

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, December 19, 1868.

City Stocks.

The transactions in miscellaneous stocks, since our last similar reference, have been comparatively light; however, the sales in the Board are no criterion for dealings in this description of securities. This is particularly the case with city bonds, of which large transactions are frequently made from private hands. In the Board sales of San Francisco Gas stock were made at $76 50. Ninety five shares of Pacific Tannery and Boot and Shoe Co. stock sold at $60@65 per share. This company paid its usual monthly dividend of 1¼ per cent. on the 15th inst. At the close a few shares of Spring Valley Water stock were sold at $66 per share.

Mining Share Market.

A fair degree of activity pervades the mining share market; however, early in the week it exhibited a downward tendency, but the past few days better prices have been obtained, and, as a general thing, a healthier tone is manifest. The near approach of the holidays does not interfere as much with the market as we anticipated, the aggregate sales being as large as for the past few weeks of more than usual activity. In fact, this rather sudden activity is much greater than a casual observer would be led to believe, and the assertion of one of our most prominent brokers, that he did as large a business during the past fortnight as during any like period since the organization of the Board, may be taken as evidence of this fact. The very fair discoveries in several of the claims on the Comstock lode and the flattering prospects of others has imparted considerable buoyancy to the market, inducing increased operations on the part of speculators.

Trade, in nearly all departments, is unusually active, being continued farther in the year, on account of the facilities for commmnication growing ont of the existing dryness. Our capitalists are rapidly coming to the conviction that a more extensive net-work of railroads will soon be reqnired to bring to market the prodnce of our many extensive and fertile valleys, and open up the resources of large and valnable tracts now nnoccupied. We must also have more direct and rapid intercourse with our rich mining regions, many of them being so remote from this market as to create large and unnecessary expense in placing their prodncts at the point of consumption.

Empire—is quotable at $110@115. The annual meeting of the stockholders of this company was held on the 16th inst. From the Secretary's report we take the following: $215,055 in hullion was obtained from 10,724 tons of ore, being eqnal to $20 05 per ton. Last year the bullion account amonnted to $258,400, and 5,770 tons of ore sold, realizing $36,183. The expenses for mill acconnt the past year amonnted to $119,925, and for mine $72,779. Liabilities above assets, Nov. 30, 1868, $13,679. The expense of sinking the Imperial-Empire shaft has been quite heavy npon this as well as the Imperial company, the depth attained to date being about 1,100 feet; and it is confidently believed that very satisfactory resnlts will follow drifting from these lower levels. The following are the officers for the ensuing year: President, Robert Sherwood; Secretary, Geo. R. Spinney; Trnstees, Charles Mayne, Robert Sherwood, John A. Stanley, W. G. Wayman, and A. E. Head.

Ophir—was in the market at $40@38, and at the close realized $32 50. The annnal meeting of this company was held on the 16th inst. The receipts for the fiscal year ending with date of meeting amomted to $178,691, of which $149,-065 was from assessments, $14,958 from tolls, and only $3,558 from the mine. The expenses during the past year have been principally npon the new shaft, amounting to about $130,000. The year closed with a cash balance on hand of $24,806. From 1860 to the close of 1867 the hullion receipts amonnted to $5,286,639, from which were dishursed $1,394,400 in dividends. The assessments required dnring the same period aggregated $425,600. The following officers were elected to serve the ensuing year: John Gillig, President; Vice-President, Lewis Gerstle; Secretary, Edward F. Stone; Trustees, John Gillig, H. F. Cntter, A. Henne, Lewis Gerstle, S. W. Glazier, W. J. McDonald and James Denman.

Imperial—advanced from $110 to $124, receded to $114, and closed at $117. Up to the 17th they received $7,284 10 in bullion from the mine. A letter of the 15th inst. states that they have commenced sinkiug on the streak found on the east clay on the 900 level, and have encountered very little water so far. The dump, at this date, contained about 300 tons of ore. This company levied an assessmeut of $25 per share on the 15th inst.

Cholar-Potosi—fluctuated within a range of $161 50 and $170, closing at $170. Extracted 1,392 tons of ore during the week ending December 11th, against 1,237 tons the previous week. Very little change noticeable in the stopes durihg the week, except a slight improvement in the ore.

Yellow Jacket—was in slight request, advancing from $1,339 to $1,300, then selling at $1,347 50, and at the close realizing $1,305. The *Safeguard* has the following: "No ore has been taken from the 900 level dnring the week ending December 12th; in fact, the level has been flooded with water most of the time, owing to the pump having been stopped for repairs, the 50-feet snmp not being of sufficient capacity to hold the drainage for the time of snspension. The east drift, 900 level, however, is forhidden ground to ontsiders. The north drift, 800 level, is now being pnshed to make the connection with the old north mine. The north body of ore eut by this drift held well in qnality, and the width was well maintained. In addition to this, some good ore has been strnck in this drift still further to the north, the extent of which has not yet been ascertained, but from the locality in which it is fonnd the discovery is thought to be of great importance."

Hale & Noscross—improved from $79 to $84, and at the close sold at $82. Remarkable progress has been made in the west drift from the 1,100 level, and it is believed that favorable developments will soon be made, as the workmen are thonght to be near the ledge. Latterly all information concerning this mine has been kept very quiet. An assessment of $5 per share was levied on the 12th instant.

Kentuck—ruled at $243@255, and closed at $250. It is believed that the oro now in sight will enable this eompany to declare dividends for many months to come....Crown Point was in the market to a considerable extent, selling at $51@54 50, and closing at $50.....Savage sold largely nnder an advance, improving from $73 25 to $89 50, and closing at $84.

Amador (Cal.)—sold at $232 50@238. A dividend of $6 per share is payable to-day (the 19th). The reeeipts for December account have been $13,000.....Eureka (Cal.) is quoted at $210. A dividend of $7 50 per share is payable on and after to-day....Bullion sold at $17 50@19. Work in the lowest levels is carried on without interruption. An assessment—the 23d—of $10 per share was levied on the 7th instant.

Alpha—improved from $41 to $46 50, and closed at $45. The incline progresses very favorably, the bottom being now thirty-two feet below the 940 level. They are averaging three feet per day, and no water is encountered except that which comes up with the grounid....Overman was tolerably active, opening at $49, then selling at $75 50@83 50, assessment of $20 delinqnent, and closing at $82. On the 11th instant, sent forward $7,952 in bullion. Nothing new concerning the mine.

The aggregate sales in tho Board since Satnrday last have been as follows: Regular sessions, $1,532,522; open sessions, $434,176—total, $1,-966,698.

Messrs. P. H. Drake & Co., proprietors of the Plantation Bitters, are said to be the largest importers of St. Croix Rum and Calisaya Bark in America. The Rum imported by this firm is all nsed in the preparation of their Bitters, and is manufactured under the immediate supervision of one of their agents npon leased plantations on the Island of St. Thomas. Over nine thonsand pnncheons—about one million gallons—is nsed annually for their hitters alone. The Calisaya Bark is all imported from Brazil, and is also gathered and selected by the natives, nnder the supervision of an agent sent out for that purpose. The cures prodnced by these Bitters are wonderful.

The reason why Muller's Spectacles meet with snch nnbonnded success, is owing to his knowledge of and ability to fit the glasses to the various conditions of the eye. Try him; 205 Montgomery street.

Concerts.—Those mnsical entertainments at Woodward's Gardens on Thursday and Snnday afternoons, are deservedly popular. There is no better place to spend an hour pleasantly and profitably.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

A new Mint is about to be built at the Dalles, Oregon, after plans made by Col. J. F. Morse, Department Architect for the coast. The building will be one of considerable size and fine appearance, of two stories and a full basement. The size on the ground is 50½x90 feet. The superstructure will be crowned by a snitable cupola, fourteen feet in diameter, twenty-one feet above the roof and seventy-two feet above the ground.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Chronicle, Dec. 5th: We have been shown a small lot of bullion, nearly three pounds, the result of the working of about three tons of ore from the Gould & Curry claim —one of the Pittsburg Co's claims near this town. The ledge was struck last winter, but this is the first lot of the ore that has been worked here. This bullion contains some gold, and the amalgamator is confident that it will pay well to work at the Co's mill. Men will be immediately set to work getting out ore. The bullion mentioned above will be molded in silver brick style, and forwarded to the company at Pittsburg, Pa.

The Pennsylvania tunnel this week cut a spur of very rich quartz.

On Tuesday last, Supt. Slaven shipped to San Francisco 1,492 ounces of silver bullion from the IXL claim.

The President of the Morning Star Co. left for San Francisco this morning, with 1,600 ounces of bullion, being a portion of the proceeds of the Morning Star ore worked at the Pioneer mill, at Markleeville, by Knstel's chlorination process, which has proved a perfect success in working the rebellious ores of this company.

The tunnel in the Morning Star mine has been run a distance of about 1,600 feet. The rich, black ore was struck at a distance of between 800 and 900 feet. At this point a spacious chamber has been made by the removal of the ore. From this chamber an incline has been sunk 110 feet, and a heavy body of rich ore struck.

Markleeville *Miner*, Dec. 5th: An old miner residing in Alpine assures us that he has a claim, from which, without further opening, he can get out 20 tons a day of rock, which will pay by mill process $30 per ton, at a cost of not over $5 per ton, delivered at any mill not over a mile from the mouth of Monitor Creek, including the mining and hauling to mill.

Butte County.

Transcript, (Nev.) Dec. 3d: The quartz mill at Yankee Hill, Butte County, was burned on the 20th inst. Insured for $8,000.

Kern County.

Havilah *Courier*, Dec. 1st: McKeadney had a run of four days last week on 16 tons of rock from the Delphi, which yielded $2,950 in gold. The mine seems to increase in richness as it is further developed.

Los Angeles County.

Los Angeles *News*, Dec. 8th: The mines of Soledad have been attracting attention for some time. The mill of Polk & Kabler has tested thoroughly the richness of the Soledad mines.

Star, Nov. 28th: Work is being pushed ahead rapidly on the Temescal tin mines, and a great body of very rich ore has been laid bare in the Tahalca claim.

Mariposa County.

Mail, Dec. 11th: The Mariposa Co. has nearly completed the new quartz mill erected at the Benton Mills, which will crush quartz rock under the Ryerson process. The old mill, at the same place, will also be repaired.

E. O. Darling, of Bear Valley, has purchased the interest of W. W. Kelton, in the rich vein known as the Maggie Russell, in behalf of some San Francisco capitalist. The vein is said to be immensely rich, and will no doubt, when the preparations for working the same are perfected, give employment to a great number of hands.

Nevada County.

Grass Valley *Union*, Dec. 9th: We have no especial big strikes to chronicle, but we note that steady work has been going on since our last review of the mining situation. On Massachusetts Hill and New York Hill there are two mines which are paying their way with, probably, something ahead. A. B. Brady, on the New York Hill ledge, is quietly making his mine pay its own way, and has it now in a condition which promises a dividend ahead. He took hold of an old and caved-in shaft, put up a pump and re-rigged the hoisting works, and is now down about 300 feet on the ledge. We yesterday saw some splendid rock from that mine. The Shanghai mine, near the old Rocky Bar, has been, for a long time, paying well. The ledge is small but very rich, abounding in specimens. The hoisting now done is by horse-power, with the owners themselves as underground miners. We hear it stated that the owners of this mine, not long since, bought it for a small amount, after it was refused by many who were posted on our mines, and with no capital, except their own knowledge of conducting such operations, and their own muscle, they commenced work. The North Star has been taking out a splendid quality of rock from the Weimar Hill part of its claims. This is mined at comparatively little expense, at present. A friend suggested to us the other day that as hydraulic diggings, Ophir Hill would pay right down to bedrock.

The Idaho continues to yield an excellent quality of rock, the new mill works admirably, and the mine may now be regarded as among the best in this vicinity.

Dec. 10th: The Empire Co., on Ophir Hill, are taking out, and have been so doing for several days past, extremely rich rock.

A very large water-wheel went through town yesterday afternoon, on its way to the Larimer mill, on Wolf Creek. The mill is being put in order for the next crushing from the Bay State ledge.

Numerous teams have been hauling quartz through the town for several days past. The rock comes from the northern portion of the district, and goes to the custom mills below town.

Grass Valley *National*, Dec. 8th: James K. Byrne and others have located 700 feet on the Eagle ledge. This ledge is located 130 feet west of the John Bright ledge, Grass Valley township.

Oct. 10th: Frank Morse has purchased the water-wheel of the old Rough and Ready mill, and had it hauled down to Larimer's mill yesterday, where it will be put up immediately, so that his next crushing can be done within a few yards from the mouth of the shaft.

James Meagher & Co. have located 800 feet of ground on the south side of the North Fork of Poor Man's Creek, Eureka township. The claim breasts on the creek and runs back to the center of the hill.

Gazette, Dec. 8th: Placer mining at Diamond Creek is nearly suspended for the winter, but considerable is now being done in quartz mining. Pease, Dooling & Co. have located a ledge recently discovered, which presents more favorable indications than any other in that region. It is over two feet in width, and prospects remarkably rich. They have named it the Pawtucket. The Salathiel Co. have struck good paying ore in their lower level, and have resumed active operations in the mine. The last crushing from the Camanche ledge, of 36 tons, made at the Salathiel mill, yielded $30 a ton. The owners of the Cocomongo and Enterprises ledges are vigorously at work to open their mines. About 75 men are employed on the ledges mentioned above, and have their winters supply of provisions laid in. Diamond Creek bids fair to be a flourishing mining camp next season.

Dec. 10th: Last week a miner on Rush Creek, two miles from Nevada, sunk a shaft on a quartz ledge to the depth of 20 feet, and struck a rich pocket that yielded $22 a pound in a hand mortar.

Dec. 11th: The Cornish mill and mine, two miles below Nevada, on Deer Creek, have been in active operation for months past. The company have a tunnel in 1,400 feet, and the ledge varies from two to five feet in width. They have been taking out and crushing about 200 tons of rock per month, and have an unlimited amount accessible from their tunnel.

Dec. 12th: A gentleman down from Eureka gives us the following particulars: The Erie mill is now crushing rock from the Jim Crack mine. The rock pays well, and the ledge is from 12 to 15 feet wide. The Stacy, Banbury & Co. have had a clean up this week of a quantity of rock worked at Black & Young's mill. From $8,000 to $10,000 in amalgam was the result. The Birchville mill is running constantly on good pay ore from their own ledge. The Jim Mining Co. have just received and placed in operation a new engine, boiler and pump, and are sinking on their claim for a lower level. All of the mills mentioned have laid in a good supply of wood, and will be enabled to prosecute work vigorously all winter. E. Doliver has recently purchased the interest of Oscar Palmer, in the Palmer & Everingham mill, and the new firm have just finished crushing 200 tons of rock from the Iowa ledge.

Virginia *Enterprise*, Dec. 11th: At Perry & Irwin's saloon are to be seen some very fine specimens of cement containing gold, brought from California by Les Blackburn, of this city. They came from the Nebraska mine, French Corral, Nevada County, and some of them are literally studded with fine washed gold. The mine is owned by Henry Poulinet & Co., and is yielding very largely, the cement being crushed in a water-mill owned by the company. With the specimens is a phial containing about $6 worth of gold, taken from two pounds of the cement by washing in a pan.

Transcript, Dec. 13th: Dahle & Co., of the Banker Hill ledge, are putting up a new quartz mill at Rough and Ready. Some of the companies owning claims in this vicinity have resumed work, and are confident that they will make a strike after a while.

The North Bloomfield Gravel Mining Co. have about completed their ditch for conveying water from Little Cañon Creek to North Bloomfield, and have surveyed a route and will immediately construct a ditch from North Bloomfield to Columbia Hill.

Hickey & Co. are running a cut through the bedrock for the purpose of getting sufficient fall for the working of their claims to a greater depth. The miners at Moore's Flat have abundance of water the year round, and are doing well in their claims.

Dec. 15th: A survey for a tunnel 5,000 feet in length, from Missouri Cañon, to tap the rich gravel beds at North Bloomfield, has been completed. This tunnel will be built by Black & Co., and will enable them to work an exceedingly rich range of gravel which has heretofore remained unworked for want of fall. The proposed tunnel will furnish an outlet over 225 feet deeper than has ever yet been obtained from the gravel claims in the vicinity of North Bloomfield. These claims were heretofore washed into Humbug Creek, and yielded good returns from surface washing. By the building of the new tunnel, the old ground will be worked to the bedrock, and an extensive range of new ground opened.

Grass Valley *National*, Dec. 14th: The Grant ledge, below Forest Springs, continues to yield good rock. The owners are putting up a water-wheel for hoisting purposes, and are satisfied that the mine is a lucrative investment.

Hans Roberts picked up a lump of gold, weighing eight ounces, on his diggings, this side of Rough and Ready, on last Saturday morning.

EXCELSIOR.—The *Transcript* says: The Mohawk and Montreal mine of Meadow Lake township, is giving first-rate returns, but on account of the large quantity of sulphurets, a large proportion of the gold is lost by the present system of working. At a recent meeting, the Trustees levied another assessment, and decided to build furnaces and machinery for the purpose of working the sulphurets by the chlorination process. The assays for 60 days past have been from $32 to $682 to the ton, which is sufficient to indicate the value of the ledge. The office of the company is to be removed to San Francisco. Rock from the Independent ledge in this township is being crushed, and gives evidence of richness. A clean up will be had in a few days.

Placer County.

Auburn *Herald*, Dec. 12th: The new 20-stamp mill, on Bald Hill, is now completed, and at work for the past few days. It is said to work finely.

A tunnel has been run on the Fortuna ledge, and a shaft sunk from the tunnel to a depth of 30 feet. The surface rock yields $10 per ton, exclusive of sulphurets. Some of the sulphurets imperfectly cleaned, were tested at Maltman's works, in Nevada County, and yielded $165 per ton.

Sacramento County.

Folsom *Telegraph*, Dec. 12th: The mining dam of the Natoma Water and Mining Co., on the South Fork of the American River, was finished on Friday, December 4th, and the water turned over it. The dam is 300 feet long by 16 feet in hight. The main ditch now receives 2,500 inches of water.

Sierra County.

Downieville *Messenger*, Dec. 12th: The owners of the Morning Star claim at Chip's Flat, have struck good pay in their claims.

Tuolumne County.

Sonora *Democrat*, Dec. 12th: At present, the supply of water at Chinese Camp is limited. The pipe has a capacity of 300 in., and but 150 inches can be obtained. Some claims are being worked and others are being put in readiness. The people of Chinese do not expect any great activity in mining operations until next spring, when a full supply of water will be had.

Yuba County.

Marysville *Appeal*, Dec. 15th: The former President of the Pennsylvania mine writes us as follows, under date of the 14th inst.: The Jefferson Co. is still making expenses, but struggling hard for something better. The Rattlesnake Co. have very good quartz, but their ledge is still not over from eight to ten inches. Two month's work, or an outlay of from $1,200 to $1,500, will decide the fate of this claim. The Pennsylvania Co. has now 16 stamps running, on tolerably good quartz, day and night. The mill is mostly supplied from level No. 9, where a very large body of quartz is still in sight. As to level No. 10, where the ledge is about 15 feet in width, it will require about two weeks more before its rich quartz can be taken out in large quantities. From what I see I have no hesitation to say that the claim is worked judiciously and most economically. I understand that 50 shares of Pennsylvania stock changed hands a few days ago at $18 per share, and that $30 are now asked and $20 offered.

ARIZONA.

Prescott *Miner*, Nov. 28th: We have received two large pieces of sulphuret ore from the Chase mine, near Prescott. The tunnel is now in over 200 feet, the ledge is widening out, and the ore looks splendid. These specimens are composed of grayish white quartz, which contains a great deal of sulphurets, or iron pyrites, said to hold lots of gold. The sulphurets are very small and darker in color than those of the Sterling or Galena.

The news from the Sterling mine continues to be cheering. The mill is grinding away, and chlorination will be tried before long. Two shifts of hands took out recently, in one day, 14 tons of rock. The ledge is very wide. The little 5-stamp mill crushes about seven tons in the 24 hours. A partial clean up has been made, which yielded about $30 to the ton in free gold.

Two men, who, for several months past, have been engaged in placer mining on Black Cañon Creek, arrived in Prescott, Monday last. They are well pleased with the diggings. They washed out about $8 a day to the hand. There is room at Black Cañon for 1,000 miners, and hundreds of bars that will pay as well, if not better, than the one recently worked by this party.

The Vulture mine, at Wickenburg, continues to yield well. At latest dates both mills were running.

COLORADO.

Central City *Herald*, Nov. 25th: Huepeden, Wolters & Co. have bought a new engine, and are going to put it up at once....Brnckner & Scirmer's furnace in Georgetown, is running on Terrible and Equator ore....The Consolidated Gregory Co's new 50-stamper at the month of Four-mile Gulch, Black Hawk, is now completed. It is running steadily on ore from the company's mine. They have an abundance of it to crush....Mr. Hurd's new 20-stamper, at Black Hawk, is doing good service in the reduction of ore from the U. P. R. lode....The Coley lode is producing some very rich ore. A specimen assayed by Mr. Sherman contained $18,907.34 per ton. We have seen some of this ore, and consider it equal to, if not better than any yet found in Colorado. It is a black sulphuret, very brittle, and contains numerous specks of native silver. The Coley is yielding a large quantity of ore which will average over $200 per ton.

We have the following from Granite district: In Colorado Gulch, Tisdell & Co. have been taking out from $12 to $15 per day to the man. Cree & McCannon have done well, taking out from $25 to $35 per day to the man.

California Gulch has paid from $12 to $15 to the man during the past summer. The 5-20 Co. in this gulch have been running their 10-stamp mill for the past few weeks with good results. The Treasury Co. are working the Magenta lode, and have a shaft 73 feet in depth, which is the deepest in the district. They are crushing all the crevice, which is six feet wide, and making it pay $75 and upward per cord. They have a 15-stamp mill. The Yankee Blade lode is down about 46 feet, and has averaged about $200 per cord, in Morrison & Partridge's mill.

The Dowry lode is down 50 feet, has a 3-foot crevice, and has paid well.

Smith & Walley have got an 8-stamp mill ready to run. Hayden has a 9-stamp mill also ready to run.

Denver *News*, Nov. 25th: Prof. Hill has begun building a new smelting and calcining furnace. This will double the capacity of his works, making them equal to the production of $50,000 a month. He does not find the supply of ore sufficient to run two smelting furnaces, although it is too large for one.

Central City *Register*, Nov. 19th: A large amount of digging is going on, on the mountain side, in the vicinity of the U. P. R. It is said that a strong and very rich lode has recently been discovered there.

An assay made at the Register assay office, of a quantity of samples taken from various places in a 3-foot crevice of lode recently discovered by Mr. Zeilor, in Slaughter House Gulch, gave at the rate of $78 in silver per ton, coin value.

We have seen assays of ore from the Pratt lode, one of which shows $59.64 gold, $34.97 silver, and $52.86 copper, making a total of $147.47 per ton; the other shows $83.71 gold, $36.46 silver, with a fair percentage of copper.

Waterman & Phillips, lessees of the Black lode, or a portion of it, are meeting

with fine success. From claim number 2 they are taking a quality of ore for which Prof. Hill pays $345 per ton.

DACOTAH.

Sweetwater *Mines*, Nov. 25th: Six hundred feet of the Young America ledge, in Shoshone district, were sold a short time since in Chicago for $50,000. It is one of the best ledges in the district, and yields exceedingly rich ore.

Two very fine nuggets were recently found in the placer mines on Rock Creek; one weighed $174, and the other $15.

The 20-stamp mill for the Miner's Delight Co., was shipped on Monday last for the mines. If the weather favors them they will soon have it at work, as the building is completed and ready for the machinery.

We have heard of a 10-stamp quartz mill which is to be shipped to Sweetwater soon.

IDAHO.

Owyhee *Avalanche*, Dec. 5th: The Ida Elmore 20-stamp mill, formerly called the Lincoln, has steamed up again, after having been thoroughly renovated and burnished. There are now in the yard about 600 tons of Ida Elmore ore, of a grade which gave the mine its almost world-wide celebrity.

The Walla Walla *Statesman*, speaking of Warren's Camp, says: They have now at work in the camp a 10-stamp mill and a 5-stamp mill. There are also some eight or nine arastras, that are being worked to advantage, although thus far they have experienced great difficulty in saving the gold and silver. As showing the disadvantages under which the miners labor, Mr. B. exhibited to us a button of silver, which was taken from two pans of tailings. This button assayed silver, to the ton, $4,272.27; gold, $248.36; total, $4,520.63. That is to say, after the rock had passed through the arastra and left the mill, it still remained charged with nearly $5,000 to the ton. This rock was taken from the Bullion lead. Within a circle of four miles the Bullion, Martinez, Alder, Hic Jacet, Wm. B. Knox, and Sampson, all distinct ledges, and all rich in either silver or gold are found. Operations may be said to have only fairly commenced at Warren's during the season just closed, and from the developments made it is thought that with another season Warren's will take rank among the most important mining camps in the northern country. All work in the mills is suspended for this season, but a large number of hands will be employed during the winter in getting out rock. Wages are high in the camp, $5 and $6, and at this figure it is only the very best rock that will pay for crushing.

Boise *World*, Dec. 3d: Mr. Thomas Mootry informs us that a new and rich strike has been made in the Gold Hill quartz ledge, on Granite Creek. He exhibited to us several specimens of the rock, and they showed from good to extraordinary richness in gold, and some of them contained rich sulphurets, which revealed a good showing of silver. This strike was made about 50 feet below the surface, on the south side of the main ledge wall, and the ledge is three feet wide. The rich streak, from which the richest gold-quartz specimens were taken, is eight inches wide, and the remaining 28 inches prospect handsomely in silver ore and sulphurets.

Silver City *Tidal Wave*, Nov. 11th: Black's mill, Flint district, will start up to-day or to-morrow on Forest ore; they also have quite a pile of Rising Star rock on the dump, which, with the 300 tons of Forest, will keep them busy for some time to come.

New discoveries have recently been made 15 miles south of Flint, in South Mountain, that present some new characteristics in the way of mineral-bearing rock.

Pickens & Edwards are down upon their ledge, at Cottonwood, 20 feet, and find pay rock still increasing in thickness, and holding its character for richness; they have a nice pile of fine looking rock on the dump in which ruby silver is plainly visible.

MONTANA.

Helena *Post*, Nov. 20th: We learn that snow now covers the German Gulch mines to a depth of two feet; but 40 men are wintering there. The yield from this gulch has been more remunerative than the previous season. It is safe to say that not less than $25,000 have been realized. The Beef Straight ditch, to furnish a sufficient quantity of water for next season, is about half completed, and will prove a great auxiliary in mining in German Gulch.

After having for a long time lain idle, the claims of upper Last Chance Gulch are being energetically worked, and are paying well. The claim of Dempster & Co., just above the cañon, has been recently opened, and is now being worked by means of a whim, and pays from $18 to $25 per day to the hand. The pay streak is about 100 feet in width.

Parties in German Gulch have struck bedrock on third drain ditch, and have found splendid prospects. In McClellan Gulch the claims are paying splendidly, and it promises to be very prosperous this fall.

Nov. 27th: One of the largest transactions in mines which ever transpired in the Territory, took place yesterday in our city, some 700 or 800 feet of the celebrated Park mine having been bought by J. W. Whitlatch.

The Deer Lodge *Independent* says: Prof. Swallow's mill is still at work upon Ballarat ore. The yield far exceeds the Professor's expectations.

Wigwam Gulch is being opened with every prospect of being splendid pay.

NEVADA.

Humboldt.

Unionville *Register*, Dec. 5th: John C. Fall & Co. shipped by Wells, Fargo & Co., from their office in Unionville, during the month of November, $12,605.

Stewart & Co's new mill was started up on Monday last, and he is now pounding away on Arizona ore, which is expected to yield similar returns to that worked in the other mills by Fall & Co. They have not cleaned up yet. The mill works admirably, promising to give entire satisfaction.

Reese River.

No news of importance, other than already published, has been received from White Pine district, during the past week. The excitement seems to be increasing, as many of our exchanges are noticing the departure of large number of citizens daily for the "poor man's paradise." We only hope that it may not turn out in the end, like Black Rock, and many other similar mining excitements,—to many "the poor man's curse."—[Eds. Press.

Austin *Reveille*, Dec. 7th: The Buckeye mine in Summit Cañon, north of the Murphy mine in Ophir Cañon, is producing fine ore. Some 20 tons which were reduced at the Manhattan mill in this city last week gave the average pulp assay of $350 per ton. We learned that more of the same quality of ore was being hauled to the mill.

Four bars of bullion were brought into this city yesterday from the White Pine mill at Hamilton, White Pine.

Dec. 8th: Last evening the stage from Belmont brought into this city seven bars of bullion from Col. Buel's mill, at Belmont.

In a shipment of 16 bars of bullion, valued at $26,057.77, made to-day by Mr. A. A. Curtis, Superintendent of the Manhattan Co., there was a large bar of fine silver valued at $1,935.34.

Dec. 9th: Wines & Co's stage brought into this city this morning, consigned to W. S. Gage & Co., 11 bars of bullion, of the average fineness of .980, and valued at $16,028.99, from the mill of the Centenary Co. in the district of Newark.

Unionville *Register*, Dec. 5th: We were shown a sample of White Pine ore, one day this week, by a man just in from that wonderful region, which bore such striking resemblance to the "black wax" of Isenheck memory that we are at once carried back in fond memory to the scenes of that unfortunate's discomfiture. Who knows, after all, but poor, persecuted Isenheck may have been a scientific cuss who had known in his experience such deposits as that of White Pine, with its fabulous yield of silver, and owing to the striking similarity of the "black wax," had in a moment of inspiration pronounced it the same metallic substance. We would respectfully call the attention of Father Lewis—sometimes called "Old Snarley"—of the Reno Crescent, to this version of the case, and ask him and the little circle of scientific gentlemen who were the ardent friends and faithful followers of poor Isenheck through good and evil report, to have a further investigation made, as it may yet turn out that Black Rock bromides and White Pine sulphurets are one and the same.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Dec. 8th: We understand that of late new and very valuable deposits of ore have been found in both the Yellow Jacket and Savage mines. Vast quantities of very rich ore could daily be taken from the latter mine did the owners and wire-pullers see fit to let it come out. It is there, but it appears to suit the plans of those controlling the mine to let it stay there for the present.

The Bonner shaft, Gould & Curry mine, is now down 1,185 ft., at which point a considerable body of quartz (it fills about half the size of the shaft) has been found. This quartz is of a very promising appearance, though it assays but about $5 per ton. At present no work is being done in the bottom of the shaft, as it has been found necessary to put in new timbers in places, and a new pump column and engine will be needed before work can be conveniently done on the vein of quartz which has been found.

Dec. 9th: Sweetapple & Hirsehman are taking out a considerable amount of good milling ore from the old upper levels of the Mexican mine. The Belcher Co. are taking out from 20 to 30 tons per day of milling ore, and expect soon to do much better. The body of ore found at the 940-ft. level of the Alpha some time since, six feet in width, proves not so good as was at first supposed. Sinking 200 ft. deeper is to be prosecuted for something better. An incline is now being sunk from the 1,200-foot level of the Bullion mine, which will be put down 200 ft., making a depth of 1,400 ft. in all on the vein—before stopping to drift. A drift north from the 800-ft. level of the Crown Point has developed a very good body of ore, but it proves to be on the Kentuck ground. The total depth of the Imperial-Empire shaft is at present 1,000 ft., and sinking is still being continued, the rock is soft and good progress is being made.

Dec. 10th: It will require some four weeks to properly repair the main shaft in the Gould & Curry mine and put in their pump, and until this is done nothing will be known of the value of the deposit of quartz lately found in the mine.

Dec. 11th: We understand that the "English mill" on the Truckee river, is now undergoing repairs and will shortly be started up on rock from a mine in Desert district. This mill was built in the best style and at an immense expense.

The Bullion Co. have just received and are now engaged in putting up one of Root's patent blowers, with which to furnish fresh air to the drift which is being run from the bottom of the main incline. The bottom of the incline is still as dry as a bone, with no sign of water coming in from below. There is a small quantity of water soaking into the shaft, but it comes from the upper part of the mine. For 10 days past a strange phenomenon has been observed in the mine, which is the spurting upward of numerous small streams of air. Over the whole bottom of the shaft hundreds of small jets of air are constantly blowing up and with such force as to instantly extinguish a candle if held toward the floor of the shaft. Pockets of water have often been encountered in our mines—why not a pocket or cavern filled with compressed air? The shaft is now some 1,400 ft. deep, and the workmen think they are about breaking into a cavern leading through to China, as the air that comes up from below has somewhat the odor of tea.

Dec. 12th: The Sacramento mine, Cedar Hill, is at present yielding a considerable amount of excellent ore. In working it some astonishingly rich specimens are occasionally met with.

There was shipped from this city during the past week 5,241 lbs. of assayed bullion, valued at $154,643.94.

NEW MEXICO.

Santa Fe *Gazette*, Nov. 14th: At our latest advices from Maxwell's, his quartz mill was in operation and taking out $2,400 per day. At the time of the discovery of this lead last summer, many, very many, were incredulous in regard to the reports that were put forth in reference to its richness and value. We were, however, convinced of our mistake by good and reliable evidence which was furnished at the time. The practical workings of the mill of which we speak, will convince all others of the value of the lead.

OREGON.

The La Grande *Sentinel* asserts that Eagle Creek is the richest quartz district in Oregon.

The Roseburg paper says that the rich surface diggings, known as the Randolph claim, in Coos County, are attracting considerable attention. There are at present three wealthy companies organized and at work with great profit. Streaks of sand have been found, so rich in the precious metal, that one man could take out from $40 to $50 per day.

English Appreciation of Yankee Notions.—The American system of "expressing" language from railway stations to hotels or private houses, is the subject of high praise in the English papers. The *Pall Mall Gazette* states that every traveler in America goes back to England delighted with the plan of affixing brass checks on the trunks; but that no English railway company has, as yet, had the courage to lay aside the paper labels and paste pots now in use.

Distribution and Origin of Gold.—In a recent number of the *Gas-Light Journal*, Prof. W. Wurtz alludes to the conclusions upon this subject which are announced by Murchison in his new edition of Siluria, and demurs to them. We give a portion of his remarks: "It will be found to be now an accepted conclusion among those best informed, that *gold is of no special geological age;* according wholly with the writer's theory of Gold-genesis, promulgated in 1866,—which traces the origin of gold back to the waters of the Prozoic or Primeval Ocean, the precious metal having been held in solution therein by *persulphate of iron*, by virtue of an appreciable solvent action of the latter on metallic gold; a fact which was discovered by him and published as long ago as 1858, and which clearly and simply explains, moreover, the formation of organic matters upon the auriferous persulphate of iron of the ocean (an action coincident with the birth of Life); besides making plain many other things heretofore deemed almost inscrutable mysteries.

The occasional occurrence of eruptive masses and dykes,—both of which are probably, and those which are very doubtfully "igneous,"—in erystalline schists containing auriferous beds and veins, may, in the writer's view, be reasonably regarded as *concomitant local* effects of the same intense chemical agencies which effected the wider and more uniform metamorphic changes, to which are to be attributed the segregation of the *soluble* metallic and other contents from the mass, and their collection and concentration in fissures, forming metalliferous veins. Even if it be maintained that the eruptive masses are altogether of foreign and exotic origin, and even that the *heat* which effected the metamorphic changes throughout the mass was altogether derived from them, it is not apparent how this alone invalidates, or affects in any way the above proposition, or makes it necessary to suppose that the gold and sulphurets came also from the intruded rocks.

Columbia River Crossing of the Puget Sound Railroad.—Two crossings are proposed over the Columbia river, the one at the town of Vancouver, and the other some distance below, at Sandy Island. The Vancouver *Register* thinks a crossing of the river below that town would convert Vancouver into a first class sheep pasture; while, if the line cross at Vancouver and run down the Columbia to Martin's Bluff, Vancouver would be only an obscure way station. What it wants is that the road shall cross at Vancouver and run out directly across the country to Olympia. That paper says: Mr. Brooks, Chief Engineer, with his surveying party, has just passed through town, and are making as rapidly as possible for Lewis river, in a straight line for Puget Sound. We are informed that it is his intention to halt at Lewis river and run back to Columbia river, at a point near the mouth of the Washougal. The suggestion has been made that a better point to cross the Columbia river than this can be found at Sandy Island, and thence to Lewis river by the way of the Lackamas bottom; the level land which lies beyond is a most excellent route for a railroad.

Squaring the Circle, etc.—We find the following in the London *Mining Journal* of Oct. 31st: "At the French Academy of Sciences the perpetual secretary announced that a newspaper had recently revived an old story, to the effect that the Academy was in possession of a considerable sum bequeathed to it as a reward for any person who might discover the quadrature of the circle. He therefore suggested the propriety of again publishing the decision the Academy came to in 1775, of never more devoting the slightest attention to the solutions that might be sent in of the following problems: The duplication of the cube, the trisection of the angle, perpetual motion by means of a machine, and the quadrature of the circle. It justified this course as regards the latter, by remarking that many weak-minded persons, utterly ignorant of mathematics, and laboring under the impression that large sums were ready to be handed over to them in case they succeeded in solving that problem, devoted their time to it, utterly neglecting their regular business and the interests of their families, and even occasionally losing their reason by following such a vain pursuit."

A geological map of France is to be prepared at the expense of the government. The map is intended to comprise the minutest details.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR. L. G. YATES, California.
S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
Mr. A. C. Knox, is our city soliciting and collecting agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.

San Francisco:
Saturday Morning, Dec. 19, 1868.

Notices to Correspondents.

COLUMBIUM, Reese River.—The metal whose name you have assumed as a *nom de plume*, which term was applied to it by its first discoverer, Mr. Hatchett, (in 1801) was first detected in a black mineral which he found in the British Museum which had originally been sent to Sir Hans Sloane, by Gov. Winthrop, of Connecticut, and was supposed to have been found near New London, in that State. About two years afterwards, M. Ekeberg, a Swedish chemist, extracted a substance similar to all appearance from the minerals tantalite and yttro-tantalite, who, on the supposition that it was a different substance from columbium, termed the same *tantalum* The identity, however, of the two matters was fully established by Dr. Wollaston, in 1809. In 1824 Berzelius prepared what he supposed was pure metallic tantalum, and described many of its compounds previously unknown. In 1846, H. Rose discovered that the metal hitherto called *tantalum*, and previously regarded as a simple substance, is really a mixture of at least two different metals, and in some cases probably of three. The name tantalum is retained for one of the three allied metals and the other two have obtained the name of *Niobium* and *Pelopium*. According to M. Herman the yttro-tantalum, of Siberia, contains a new metal analogous to tantalum, to which he has given the name of *ilmenium*.

COLOSSUS, Sacramento.—One of the most remarkable instances of the removal intact of an immense mass of rock, in either ancient or modern times, is that of the monolith, now forming the base which supports the statue of Peter the Great at St. Petersburg. This base weighed 400,000 pounds, and was transported many miles both by water and land. In the former named instance it was supported and conveyed between two frigates, and in the latter its conveyance was accomplished by the aid of friction balls. Two vast grooved beams received the friction balls, one being placed underneath each side of the rock. The motive power was obtained by means of capstans worked by relays of men, whose operations were guided by a drummer placed on the top of the rock, the combined effects and stoppages being regulated by the beat of that instrument.

SOLVENT.—Bisulphuret of carbon cannot be formed until a temperature has been reached sufficiently high to vaporize sulphur, in which vaporized form it has to be made to come into contact with red hot charcoal.

TURBID, Austin, Reese River.—Some solid bodies, as lime and citrate of lime, are more soluble in cold water than in hot; therefore a solution of either of them when saturated in the cold, becomes turbid when warmed, and clear again on cooling.

DUTCH FLAT.—We acknowledge the receipt of a communication from "A. E. R.," descriptive of matters of interest in this vicinity.

The Earthquake Commission.

Although no positive secrecy has been imposed, or attempted to be imposed, on the circulation of what may generally transpire at the meeting of the Joint Committee on Earthquakes, we are informed that it has been deemed judicious not to have their proceedings reported in the ordinary way. One of the principal causes which led to this determination was, that while the committee contained many practical men, only a limited number cared to have their verbal mode of expressing their opinions noted and published, however valuable the facts might be that they might wish to disseminate.

From the researches of the Earthquake Commission, it would appear that the most serious earthquake which is recorded in the Spanish archives of California, took place in the year 1812, by which the tower of the church attached to the Mission of San Juan Capistrano was thrown down. We are informed by a gentleman who has visited the ruins of San Juan Capistrano that, from its adobe and cobble-stone structure, an earthquake of much less violence than the one which we have lately witnessed in San Francisco would have sufficed to produce the destructive effects described. It is presumed that we have witnessed quite as violent an earthquake as may be anticipated to occur in future in this State, and the damage in consequence of the late phenomena would most probably have been of the most insignificant character had only common prudence been exercised in the construction of our buildings, especially those erected on made ground.

In the earthquake which occurred at Boston on the 18th of November, 1755, 100 chimneys were thrown down and 1,500 shattered and thrown down in part, at the same time the ends of fifteen brick buildings were thrown down as far as the eaves. That earthquake seems to have been more severe than anything which has yet been recorded of California, and ought at least to induce the timid to be better satisfied of the stability of their California home. In fact, we are given to understand by those who have paid the largest share of attention to the study of these startling phenomena, that no age nor latitude can be pronounced free from the possibility of their occurrence. We are perhaps as likely to be entirely free from disastrous consequences of this character for a long future, as any other part of the world which the timid might select, presupposing that if they only fled it they would be permanently secure.

THE GAS-LIGHT JOURNAL—PROF. WURTZ. This publication comes to us with a new feature. Its title is now *The American Gas-Light Journal and Chemical Repertory*. Under the latter head, Prof. Henry Wurtz announces his intention to lay the foundation of what he trusts may grow in time into a most important, if not the leading, department of the journal. He purposes giving therein a condensed summary of scientific intelligence, brought down to the latest period practicable.

We may add, that Prof. Wurtz is one of the Board of Chemical Experts appointed by the Manhattan Gas Company to investigate the subject of the purification of gas; and we are promised in his forthcoming report upon the matter, the full development of a plan which is destined to mark "a new era in the art."

EDUCATIONAL INSTITUTIONS ON THE PACIFIC COAST.—On the fourth page of this number will be found a list of the educational institutions of the State, giving also the names of professors, instructors, etc. The list of institutions in Oregon, Mexico and South America—embracing an account of the mining academies of Mexico and Lima—is deferred until next week, from want of space.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 297.—Gold disseminated through quartz and chloritic slate. From the mine of B. F. and W. G. Heslip, Jamestown, Tuolumne County; 150 feet below the surface.

No. 297½.—Chloritic slate, finely stratified, looking like the leaves of a book, and thickly spangled through its entire mass with auriferous iron pyrites. The specimen is interesting because suggestive of the problem whether the Californian gold, which is found in quartz veins in this Jurassic slate formation, was or was not originally disseminated in the slates, and gradually gathered into and precipitated in quartz veins. Segregation and infiltration are well established and frequently-occurring natural phenomena, by which this opinion might be justified. If the gold was originally disseminated in the slates, it was at one time afloat in the Jurassic ocean which deposited the slates. If, on the other hand, the auriferous solutions came from greater depths than the Jurassic deposits, we must look for a very different ultimate form in which we may become cognizant of the existence of gold.

No. 298.—Sulphuret of antimony, or antimon-glance. From R. and W. Taylor's mine, sixty miles south of Gilroy, in the Coast Range. Similar ores are found around Mount Diablo. They are not worth working, of themselves, as antimony is so commonly found in connection with galena, in the smelting of which enough of it can be obtained without extra cost to supply the market fully.

No. 299.—The same, with porphyritic gangue, or country rock.

300.—Steel made by the use of the "Eureka Carbonizor." Dr. V. L. Owen, Springfield, Mass. The inventors claim for this process that it will harden malleable iron into the best of steel for edge tools with very little expense. The exhibition of samples at the Mechanics' Fair in Springfield last winter attracted much attention. The process is kept a secret.

301.—Hammer and chisel, of steel made by the same process.

302.—Ore from Lower California, near the boundary, consisting of a curious admixture of iron and copper, etc.: iron, 50 per cent.; copper, $102 to the ton; gold, $7; silver, a trace. The iron readily becomes hydrated and yellow on exposure, while the undecomposed parts assume the color of red oxide of copper. Several tons of this ore have been sent up and worked in this city. From J. S. Phillips, M. E.

No. 303.—Artificially crystallized gold, (out of solution in quicksilver). W. S. Begole, Red Dog, Nevada. (Noticed in our issue of Oct. 13th, 1868.)

No. 304.—An unprofitable specimen of a wooden carrot, recently purchased amongst other more or less wooden vegetables at Washington Market, has been sent to us for our cabinet. Wooden carrots are not uncommon in California. Though of the same species, and looking precisely like the ordinary carrot outside, everything under the bark is hard and solid wood, of excellent whittling quality. From Josiah R. Locke.

No. 305.—Oolites, deposited from springs containing lime and magnesia, in Black Rock district. From J. B. Hiskey, Sonora, Tuolumne County.

No. 306.—Quartz gold from Peñon & Blanco, 2½ miles north of Coulterville, owned by Dr. J. P. McLean.

No. 307.—Ditto, containing an admixture of talcose vein matter. From the App mine, owned by App, Waller & Co., Quartz Mountain, Tuolumne County. From the 300 foot level.

No. 308.—Gold, galena and iron pyrites in quartz matrix. From Harris & Oliver mine, adjoining the "Tryo" on the north, one mile from Jamestown, Tuolumne Co. Very rich.

No. 309.—Auriferous pyrites in quartzite matrix. From the Mooney mine, adjoining south to the Tryo or Rosecrans mine.

New Publications.

THE LIFE OF GEORGE AND ROBERT STEPHENSON; Comprising also a History of the Invention and Introduction of the Locomotive. By Samuel Smiles, author of Self Help, etc With Portraits and numerous Illustrations. A. Roman & Co., San Francisco.

In its original form, this work appeared ten years ago, but the lives of the Stephensons were so intimately connected with the principles and history of railroad engineering, that this volume became at once a kind of text-book with which to build the foundations of a knowledge of that specialty; the present being already the ninth edition. Three opening chapters give an account of the ideas and experiments of previous schemers and projectors, of the early locomotive models, of the Cornish locomotive, with a memoir of Trevethick; while a lengthy preface to the present edition brings in some of the railroading questions and problems of the day. The author says:

A notable feature in the growth of railroad traffic of late years has been the increase in the number of third-class passengers, compared with first and second class. Sixteen years since, the third-class passengers constituted only about one-third; ten years later they were about one-half; whereas now they form nearly two-thirds of the whole number carried. Thus George Stephenson's prediction "that the time would come when it would be cheaper for a working man to make a journey by railway than to walk on foot" is already realized.

One of the remarkable effects of railways has been to extend the residential area of all large towns and cities. This is especially notable in the case of London. Before the introduction of railways, the residential area of the metropolis was limited by the time occupied by business men in making the journey outward and inward daily. But now the metropolis has become extended in all directions along its railway lines, and the population of London, instead of living in the city or its immediate vicinity as formerly, have come to occupy a residential area of not less than six hundred square miles!

The aggregation of so vast a number of persons (3,463,771, the population of London), within so comparatively limited an area—the immense quantity of food required for their daily sustenance, as well as of fuel, clothing, and other necessaries—would be attended with no small inconvenience and danger but for the facilities again provided by the railways. The provisioning of a garrison of even four thousand men is considered a formidable affair; how much more so the provisioning of nearly four millions of people!

SAN FRANCISCO MUNICIPAL REPORTS FOR 1868: Published by J. H. Carmany & Co., by order of the Board of Supervisors. pp. 545.

This volume contains a useful map of the outside lands of the City and County of San Francisco, showing the reservations selected for public purposes, under Order No. 800, together with a large amount of statistical and other information pertaining to the business of the Board of Supervisors.

VACCINATE!—We advise all citizens,—and strangers, before coming to San Francisco,—to have themselves vaccinated by careful physicians, and then they may consider themselves substantially secure from all danger of taking the small-pox. Had our city authorities compelled vaccination through reliable canvassing physicians, we should undoubtedly have been freed from the pest months ago. Vaccinate, take plenty of good air and wholesome diet, and consider yourself safe to visit the city as freely as you desire.

THE WEEKLY TIDAL WAVE is the title of a new paper published in Silver City, Idaho, by T. J. & J. S. Butler. We are glad to hear that our old friend, John S., has taken up the quill, and we have no doubt but that his *Tidal Wave* will submerge everything that may oppose it. We have received the first number, and are highly pleased with its appearance. He informs us that his *Tidal Wave* has no connection with earthquakes, but that the name is merely used in a political sense. We welcome it amongst our exchanges.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

CHEAP MAPS.—Slowly, bnt surely, wo are advanciag in the development of agencies by which the necessities of civilization are to be supplied on this coast. Maps have been sadly needed. Counties, States and Territories which had to be visited were unmapped, undescribed, and even unexplored; or maps so inaccnrato as to be quite unreliable were to bo had only at high prices. Tho era of cheap maps appears to be beginning. We have received from Bancroft & Co. a fifty-cent map of Ceatral California, compiled by Wm. Henry Knight, embracing eleven counties, lyiag within a radius of eighty miles aronnd San Francisco—including Stockton and Sacramento, a corner of Placor Conaty, Watsonville and Cloverdale, as the limits—and showing all the railroads, stago routes, etc. The size is 12x18 inches, and the scale twelve miles to the inch.

PROSPECTING WITH BOOM DITCHES.—A great many valuablo lodes havo been discovered in Clear Creek County this summer, by using what is called "Boom ditches." A number of prospectors club together and dig long ditches along the monntain sido, which, when completed, are supplied with water from monntain streams. The water can be liberated at any desired point, when it washes the looso earth and rocks away—leaviag the bedrock bare, and exposing the lodes to view.

INCREASED DUTIES ON FOREIGN COPPER. The bill to increase the dutios on foreign copper, which has passed the House of Representatives without meeting aay strong opposition, will, if it becomes a law, undoubtedly resuscitate many of the copper mining enterprises in this State, which havo becu lying dormant for two years.

EARTHQUAKE-PROOF BUILDING. — Terra cotta and pottery ware chimney tops, Mansard or crib roofs, with slate or shingle covering, and wooden cornices, are recommended, and being adopted in this city, as practical measures ia the matter of earthquake-proof building.

THE HOUSE CARPENTERS' Eight Hour Leagno gavo a Calico Party, being their second annual "Eight Hour Ball," at the Mechanics' Pavilion, on Thursday evening. The attendance was good, notwithstanding the unfavorable state of the weather, and everybody seemed to enjoy themselves.

ASTRONOMICAL CLOCK.—The steamship Montana on her last trip brought out a fine astronomical clock, which is to be used by the U. S. Coast Survey on this coast. A site for an observatory is to be selected ia this city or vicinity.

A RECENT correspondent, writing in another than his mother tongue, gave a wrong name to the proprietorship of the Jndkins & Kellogg mine, which error we highly deprecate.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number —414 Clay street, below Sansome.

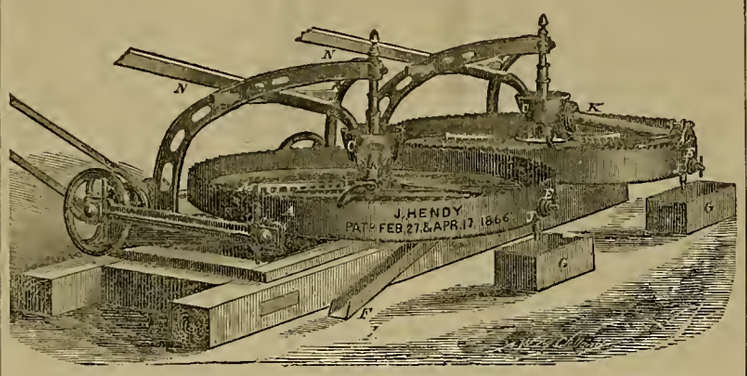
DEWEY & CO.

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our MINING AND SCIENTIFIC PRESS printing office, at No. 414 Clay street. We have no partners in business except the undersigned. DEWEY & CO.

A. T. DEWEY. W. B. EWER.

THE MINING AND SCIENTIFIC PRESS, which commenced its seventeenth volume on the 4th, comes to us with a newly engraved head, and presenting otherwise its usual tasteful appearance. We take this occasion to say that the PRESS is one of the best papers of the kind in the United States, and every miner and mechanic in the State, as well as the business man, who would keep posted on our industrial resources, should have its name on i subscription books.—*Nevada Gazette.*



PREMIUM FOR BEST CONCENTRATOR

AWARDED BY THE

MECHANICS' INSTITUTE, 1868,

ALSO AT THE STATE FAIR FOR 1868,

To J. HENDY.

A LARGE NUMBER OF THESE

IMPROVED CONCENTRATORS

ARE IN PRACTICAL USE ON THE PACIFIC COAST.

MR. HENDY, by diligent and practical application, has improved his Concentrators until they now stand unrivalled, far in advance of any yet brought to public notice.

By recent alterations in the patterns for these machines, they are now made

Stronger and more Durable than Ever.

THESE CONCENTRATORS can be seon in operation at the UNION IRON WORKS, corner of Front and Mission streets, San Francisco.

J. HENDY, Patentee.

13v17tf

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 25v17-am

WHERE TO ADVERTISE.—The attention of traders and mill machinists is called to the fact that the *Mountain Messenger*, of Downieville, Sierra County, possesses many special advantages as an advertising medium over a majority of the interior press, it being the only public journal published within a radius of sixty miles, in the richest and most populous mining sections of the State. Its weekly edition is double the average of country papers, being without the range of large dailies, and having no competition at home. Its local colums afford many items for our city cotemporaries, while its rates of advertising are reasonably low. 10v17tf

Pump Leather.

The attention of MINING COMPANIES, and others requiring a superior article for Hydraulic purposes, is invited to the heavy Oaked Tanned Pump Leather, manufactured and prepared expressly by the undersigned.

TRADE SANTA CRUZ TANNERY E. JONES & Co MARK.

Constantly on hand and for sale by GRAY, JONES & CO., Depot of the Santa Cruz Tannery, 418 Battery st, San Francisco.

E. Jones and J. Boston, Santa Cruz; S. C. Gray, San Francisco. 25v17-1y

LEOPOLD KUH,

Assayer and Metallurgical Chemist,

(Formerly of the U. S. B. Mint, S. F.)

Office, No. 611 Commercial Street, opposite the Mint, San Francisco.

BULLION MELTED AND ASSAYED, THE CORRECTness of which is guaranteed in every respect. All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner. Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs Pioche & Bayerque, Wm. M. Lent, John D. Fry, E. Gabill & Co., A. K. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M. and R. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock lode. 25v17-tf

Small Pox.

We have been shown by Wm. Zelner, the best and most convenient and portable apparatus containing Chlorine, for rooms, which we consider the best disinfectant on hand. Should advise all housekeepers not to be without one. Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street. 25v17-3m

N. W. SPAULDING,

Saw Smithing and Repairing

ESTABLISHMENT.

Nos. 17 and 19 Fremont St., near Market,

MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved themselves to be the most durable and economical Saws in the World.

EACH SAW IS WARRANTED IN EVERY RESPECT.

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE,

At the lowest Market Prices.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Orant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and language; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND Brannan streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.

Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapnico.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. Co's steamer for Central America. Through tickets can be obtained.

STEAMERS FOR DECEMBER, 1868.

The following Steamships will be dispatched on dates as given below:

December 5th—MONTANA.....Captain West, Connecting with ALASKA, Capt. Gray.

December 14th—CONSTITUTION....Capt. Wm. H. Hudson Connecting with RISING STAR, Capt. King.

December 22d—GOLDEN CITY.....Capt. J. M. Cavarly, Connecting with HENRY CHAUNCEY, Capt. Connor.

December 30th—COLORADO.....Capt E. S. Farnsworth, Connecting with ARIZONA, Capt Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired in amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched on MONDAY, January 4th, 1869, at 12 o'clock M., from wharf corner of First and Brannan streets, for HONGKONG, connecting at Yokohama with the steamer COSTA RICA for Shanghai.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing: Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pumps, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, FUEL SAVING, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

Eley's Ammunition.

These Cartridges are made in three sizes, viz ,.577 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES. .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheux Revolvers of 12 m. 9 m. and 7 m. bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

ELEY BROTHERS,
15v16cowly Gray's Inn Road, London, W. C.

INDUSTRIAL RESOURCES OF VENEZUELA.—A grant of 240,000 square miles having been made by the government of Venezuela to the "American, English and Venezuela Trading and Commercial Company," represented by Dr. H. M. Price and others. It is of interest to note some of the industrial resources of that country. Gold, silver, copper, tin, coal, soda, asphalte, petroleum, salt, alum, etc., have been found; the coal, which is of bituminous quality, and said to be equal to the best English Cannel coal, is abundant in many places. At Araya, facing the sea, are extensive salt mines, which yield the purest salt.

The working of the mines of Venezuela has been much neglected, but the existence of metalliferous veins in Venezuelan Guayana cannot be doubted—grains of gold are found in the whole mountainous territory of Venezuela, mines of gold and silver were worked at the beginning of the Conquest, and Indian gatherers have sometimes found lumps of gold 15 or 16 ounces in weight. The Spaniards, in the year 1551, wrought the gold mine of Buria, which was the cause of the foundation of Barquismeto. The mines of Los Teques could not be peaceably wrought till the defeat of the Cacique Guayeupuri, a celebrated chief of the Teques, who long contested with the Spaniards the possession of the province of Venezuela. From several geological indications there exist two groups of auriferous alluvial land—one between the sources of the Rio Negro, the Uaupes, and the Iquiare; and the other is situated between the sources of the Essequibo, the Caroni, and the Rupumeri rivers. The gold mines of Caratel and Guasipati, on the Caroni river, a short distance from Las Tablas, have lately been discovered; they are rich in gold, both in abundance and quality. The quality of the gold is 24 carats, a quality that neither California nor Australia possesses. The deposits of iron and copper are also very great in Venezuelan Guayana, but thus far undeveloped. The copper is of an excellent quality, and is even preferred to that of Sweden and Coquimbo (Chili). Mercury and lead have been found, but not yet worked.

WOODEN RAILROAD IN NEVADA.—The *Territorial Enterprise* says: Mr. Scott, County Surveyor of Washoe County, has been for some time engaged in surveying a route for a wooden railroad from Reno to this city. He finds a very good route, with a maximum grade of but 132 feet. Mr. Scott estimates the cost of the road at $300,000. The rails will be of Oregon spruce, the most compact timber on the Pacific Coast. The trains will be drawn either by horses or by light locomotives—locomotives with wheels covered with thick india rubber tires, have been suggested. Mr. Scott says that in case the road is built, wood can be furnished in this city at $5 per cord, and that quartz can be transported to the river for a mere trifle, where water mills will crush it for 75 cents to $1 per ton. The cost of grading that portion of the road between Reno and the foot of the Geiger Grade would be trifling, and even in the mountains there is no very heavy work to be done. With such a railroad almost every kind of ore found in this vicinity could be profitably worked, and sooner or later a road of the kind must be built.

REMARKABLE IF TRUE.—The following is from the Wellsville (Ohio) *Union*: Mr. James Parsons and his two sons were at work in the Strip Vein Coal Bank of Captain Lacy, at Hammondsville, one day last week, when a huge mass of coal fell down, disclosing a large smooth slate wall, upon the surface of which were found, carved in bold relief, several lines of hieroglyphics. Crowds have visited the place since the discovery, and many good scholars have tried to decipher the characters, but all have failed. There are several lines, about three inches apart, the first line containing twenty-five words. Attempts have been made to remove the slate wall and bring it out, but upon tapping the wall it gave forth a sound that would seem to indicate the existence of a hollow chamber beyond, and the characters would be destroyed in removing it. At last accounts Dr. Hartshorn, of Mount Union College, had been sent for to examine the writing.

THE COMPOSITION OF LAVA.—The lava thrown out by Mount Vesuvius during the present eruption has, it is said, been subjected to analysis by an Italian chemist, and found to contain the following ingredients: Silica, 39 parts; lime, 18; alumina, 14; magnesia, 3; protoxide of iron, 13; potash, 1; soda, 10; water, 2. The specimen, therefore, closely resembled the common glass seen in wine bottles.

SPRING BALANCES.—The following is from an exchange: The spring balance is almost the only sort of apparatus that is of more value to the owner the longer it is used. This contrivance is so, for the reason that every strain on the tension of the spring causes it to bend a little easier; so that, if admitting it furnished a true index of the weight of an article when it was new, it will not do so after a few months.

Not only is the spring balance inaccurate when compared with the lever balance, but it is, after a little use, inaccurate when compared with itself; that is, it will require a greater weight to register the tenth pound of the scale than it did the first; for the reason that smaller quantities are more frequently weighed than larger ones; or, again, if ten pounds are weighed separately, they will not weigh ten pounds when together.

QUICK TIME.—A train on the Chicago and Northwestern Railroad, on the 12th ult., made the unprecedented run of ninety-one miles in ninety minutes. The train was running east, from Fort Howard (Wis.) to Chicago. The quickest prior runs of which we have any record, are as follows: In England, 18 miles by a special train in 15 minutes. In the United States, 14 miles in 11 minutes, by an engine and six cars on the N. Y. Central; 10 miles in 7¼ minutes, on the Pennsylvania Railroad; 144 miles in two hours 49 minutes on the Hudson River road; 84 miles in 90 minutes, from Indianapolis to Union City; 305 miles in 7 hours 32 minutes, from Albany to Niagara.—*Am. Journal of Mining, Nov.* 14.

DR. NESTELL'S
LUNG INSTITUTE,
(Branch of the N. Y. Lung Institute)
No. 516 SUTTER STREET,
Between Mason and Powell Streets, San Francisco,
For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.
Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the round-about way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.
Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.
Invalids at a distance, on writing their case, can receive the remedies by Express.
Special attendance out of the city will be charged commensurately with the time and distance occupied.
All communications must be addressed to

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.
A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some plastic material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.
These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.
For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Professional Cards.

CAMERON, for the purpose of carrying on the business of Stair-Building, Wood-Turning and Scroll Sawing. The business will be conducted as formerly at Cameron's, corner of Market and Beale streets, and also at Nos 185 and 187 Brannan street, where ample steam power and all necessary facilities have been provided for every branch of the business.
Different sizes of Redwood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.
19v17-3m N. P. LANGLAND

English Capitalists beyond the Sierra Nevada.

Two English companies, whose operations at this time, beyond the Sierra, appear to be worthy of notice, are the "Nevada Lead and Mining Company," located (for reduction purposes) at Reno, and the "Imperial Silver Quarries Co." located at Monitor, Alpine County, California. At a meeting of the stockholders of the former, held in London, on October 29th, Mr. J. J. Duune, the manager, expressed his opinion (says the London *Mining Journal)* that it would be difficult for some time to farm the company's laud at a profit, and recommended that it should be laid down as meadow, by which a profit of $10 per acre could be obtained with little outlay. That portion of the company's estate immediately adjoining the town of Reuo, which already contains a population of 1,200, would be valuable for building lots, and could shortly be disposed of to advantage. As soon as the Virginia and Truckee Railroad is completed, Reno would, probably, be a considerable place, as it would be the site of all the reduction works for the Virginia ore. The company's mill was in excellent order, and was, without doubt, one of the best constructed mills in the county, but the canal and tail-race needed repairs, aud the latter required to be made much larger. Mr. Dunne was satisfied he could start the mill at once, with ores from the Humboldt aud intermediate districts, if he were provided with the necessary funds, which he estimated would be $10,000 to $12,000; and he estimated the profits would be $200 per day, as the company had the cheapest of powers, and none could compete with them. The railroad would bring ores from Humboldt at half freights, having no other back freight from there. With a view to devoting the company's funds to getting the mill to work, he had suspended all expenditure on the company's Whitmore mine for the present. Mr. Dunne also suggested that it might be advisable to erect smeltiug works in the Truckee, for the treatment of the richer ores from Humboldt.

The town of Reno was, in the opinion of the Chairman, fast rising in importance, and likely to become one of the principal seats of the industry of Nevada—that of the reduction of ores. The policy recommended by Mr. Dunne of stopping the outlay at the Whitmore mine, in order to get the mill into work, was one the directors approved, as, besides the profits auticipated from the mill, it would bring a number of workpeople and others to the neighborhood of Reno, and so increase the value of the land there. It is proposed as a beginniug, to crush Humboldt ores at such reduced rates that it will be an object for miue owners to contract for the reduction of their ores iu large quantities. The mill of the company is, according to the Humboldt *Register*, one of the finest ever built iu the State, and perfect in all its departments. The railroad passes within a few hundred yards of it, making it easy of access.

The Imperial Company, in Alpine, is at work on a tunnel which has been run in, as we are informed by the Supt., Mr. Lewis Chalmers, 610 feet, to a point 440 feet under the surface, and within 180 feet of the Imperial ledge, of which the company owns 1,000 feet; being on the same range as the Tarshish and Moruing Star mines. Other valuable lodes are to be intersected by the tunnel, which is six feet wide at bottom, tapering to five feet at top, seveu feet high from bottom of track to center of arch, and ou a grade of ⅞ of an inch to every 16 feet. The Directors in London, are, the Right Honorable the Earl Poulett, Chairman; Heury Syme, Esq., Vice-Chairman; the Right Honorable Viscount Ranelagh, the Lord Richard Cavendish, the Honorable William Towry Law, Sir Robert Charles Dallas, Baronet, Sir Reginald H. Graham, Barouet, Sir Henry Drummond Wolf, K. C. M. G., Baronet, Sir Francis Hastiugs Doyle, Baronet, George W. M. Sanford, Esq., M. P., Captain Charles Lousada, Thomas Viner, Esq.

The Mining and Scientific Press comes to us this week in a new dress throughout, much improving its appearance. The Press is one of our most valuable exchanges, and fills a place in mining and scientific matters never attained by any other journal.—*Colorado Miner*

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A model of less size will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should he sufficiently perfcet, bowever, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should he carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us hy mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is hy draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the applicntion proceeded with as fast as possible. When the documents are rendy we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our feo for prepnring the case is then due and will be called for. The caso will theu be presented to the Patent Office, and as soon as tho patent is ordered to he issued the Government last feo of $20 in currency will be required. The law states that every patent shall he dated as of a day not later than six months after the time at which it was passed and allowed, and notico thereof sent to the applicant or his agent. And if tho final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against tbe applicant therefor.

Inventors who do business with us will be notified of tbe state of their application in the Patent Office, when it is possible for us to do so We do not requiro tho personal attendance of the inventor, unless it is one of great complication, as the business can bo well done by correspondence.

When the invention consists of a new article of manufacturo, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when tbe case is conducted at our agency, is ten weeks. We frequently get them through in less time but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us may be enumerated as follows:

1 Inventors on this coast having their applications for patents made out through our agency, can sign tbeir papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can bo accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the MINING AND SCIENTIFIC PRESS, *free of charge;* the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can bo subsequently used for hooks, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the *issue* of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advances for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the *receipt* of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Patent Rejections.

FIRST. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

SECOND. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

THIRD. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), *we charge no second fee*, as is the case with some agencies, but attend to the business till finally allowed or twice rejected, without extra charge beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them hy other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from $20 to $40.

Following is the list of Government fees, payable in currency:

On every caveat	$10
On every application for a patent, for seventeen years	10
On every application for a design, for 3 yrs and 6 mos	15
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On a appeal to the Examiners-in-Chief	10
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Illustrate your Inventions.

Too many ingenious inventors lose the value of their genius and labor by not bringing their improvements conspicuously or plainly enough before the public—the general reading public.

One of the best means—and the cheapest, too—for eliciting attention to a new invention, is that of illustrating and describing it in the columns of the MINING AND SCIENTIFIC PRESS. To do this in the case of a meritorious improvement (and none other will be accepted), will cost our patrons no more than the price of a first-class engraving.

With a cheap representation we will have nothing to do, as it would be calculated to injure both the inventor and ourselves.

We also take especial pains in furnishing engravings and electrotypes of superior merit, of all kinds, at fair rates, and tender our patrons the benefit of our practice and experience, by advice and assistance, in getting up their circulars, advertisements, etc.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,

AMERICAN
(WALTHAM)
WATCHES,
THE BEST!
THE CHEAPEST!

The extensive use of these Watches by Railway Conductors, Engineers and Expressmen, the most exacting class of watch wearers, has thoroughly demonstrated the strength, steadiness, durability and accuracy of the Waltham Watch. To satisfy that class in all these respects is to decide the question as to the real value of these timekeepers.

More than 300,000 are thus speaking for themselves in the pockets of the people.

Imported watches are made on an expensive system, in small numbers, but by numerous makers, and are placed in the market here by an importer, who first secures a MONOPOLY OF SALE OF SOME ONE MANUFACTURE.

To the manufacturer's profit must be added the cost of importation.

A custom-house duty of twenty-five per cent payable in gold.

A profit of at least twenty-five per cent. to the importer another to the jobber, thus doubling the cost of the imported Watch.

At Waltham, Watches are manufactured on a large scale under one roof and system of supervision and management, thereby saving many of the expenses necessarily incurred in small establishments,—hence their great cheapness.

All respectable dealers now sell Waltham Watches, and competition, as the world knows, is favorable to small profits. The trade is satisfied, because, though the profit on each watch is small, the demand is large and all are saleable.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness, signed by R. E. Robbins.

There are different grades of finish in the different varieties of Watches made by the Waltham Company, as there are different sizes and shapes to suit all tastes and means; but every Watch that bears the genuine trade-mark of "Waltham," is guaranteed to be a good one, and nobody need be afraid to buy it.

Every Watch Fully Warranted.

For sale by all first class dealers in the United States and British Provinces.

TO MINERS.—William H. Murray, traveling agent for the Mining and Scientific Press, published by Dewey & Co., of San Francisco, is in town soliciting subscriptions for that paper. To the intelligent miner, a paper like the *Press* is particularly valuable, keeping him posted on the latest discoveries in reduction of ores, new machinery, etc.—*Grass Valley National.*

Machinery.

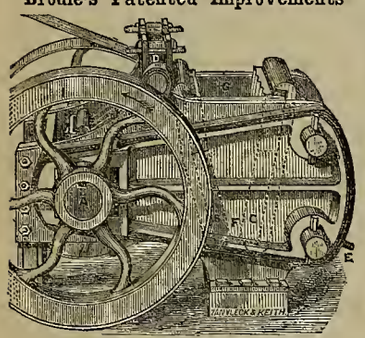
VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everrequired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:



The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

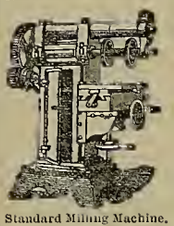
House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Piping fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.



I am now prepared to make all kind's of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sanders Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere.

☞I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

21v17-qy **J. WEICHHART, Proprietor.**

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION PATENT
Variety Molding and Planing MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the end, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

IMPORTANT TO LUMBERMEN.

ANDERSON'S
Patent Muley Saw Hangings.

These Mulays will cut FIFTY PER CENT. MORE LUMBER PER DAY than any other Mulay in use, with fifty per cent. less power. They are very durable, and easily kept in order, and warranted to give satisfaction. No Mulay Mill should be without them, as they will pay for themselves in a very short time. No other mode of manufacturing Lumber can compete with the Mulay Saw with this improvement. Send for circular. FULLER & CO.,

Manufacturers' Agents for the Pacific Coast, 109 Montgomery street, San Francisco. 17v17-3m

More Light Concerning White Pine.

A mining engineer writes from a new district, not a thousand miles from White Pine, as follows:

I am engaged here in building a small smelting establishment, which, according to the desire of the mine owners is to be brought into operation this winter, notwithstanding my best attempts to persuade them of the better policy of deferring active operations till next summer, and meantime developing properly their mines. But it is an old story, which yet is always enacted anew—and whosoever he the present actors, it is their purses that suffer. Regarding White Pine, I spent several days there four months ago. Little work had been done at that time; and as my visit was not a professional one, I did not take much pains to investigate closely the geological and mineralogical circumstances. The following data, however, are reliable, so far as relates to the ore deposits:

Treasure Hill, as well as the White Pine Mountains proper, trend due North and South. The limestone strata, constituting the body of the mountain masses, dip 20° to 25° towards the West. In consequence, the eastern slopes of the mountains are very steep, and the western very gradual, as at Chloride Flat. The limestone is more or less metamorphic, (crystalline and dolomitic), showing stratification only in general aggregates.

The northern point of Treasure Hill is formed of a strongly ferruginous quartzite, which I think occurs also in places on the eastern side. This quartzite is, according to my judgement, a metamorphic porphyry. In other districts similarly constituted geologically, (as at Reveille) where limestones and quartzites occur, I have traced it distinctly through several transitions, from the one in to the other.

In the vicinity of the quartzite mass, (near Hidden Treasure) the limestone passes into a thick bedded, yellow marl schist. In other districts I have observed the same occurence. At the southern end of Treasure Hill—quite at its foot—there is observable a substratum of thin-foliated clay slate, underlying the limestone.

The ore, I shouldsay, decidedly, does *not* occur in veins, but in irregular deposits, of which there are to be distinguished two kinds, viz., vertical and horizontal deposits. Hidden Treasure is a vertical deposit, or perhaps a "stockwerk." The Virginia, according to appearances at that time, was the same. The Eberhardt and Keystone, at the southern end of Treasure Hill, are vertical deposits, being horizontally of comparatively inconsiderable dimensions.

Chloride Flat contains a number of horizontal deposits in a zone of the limestone near its surface, in which the general location of the ore runs with the stratification of the limestone. The Eberhardt and Keystone mines are situated at a far lower ore-level than Chloride Flat; so is the Virginia. Whether deeper ore-zones occur underneath Chloride Flat, is unknown. On the steep eastern flank of the mountain, nothing has been found, thus far, I believe, which would justify that conclusiou; but on the southern side there appear to be numerous branches, *vide* the locations below the Eberhardt.

On Chloride Flat the ore was found to extend to the surface at only a few places; in most cases it was found at a depth of from 5 and 6, to 20 feet.

The average content of the ores, if we do not include those of the Eberhardt and Keystone, is not great, by any means. Though rich nests have been found here and there, the general average cannot be estimated at more than $20 to $100 a ton.

Advantages that may be mentioned in favor of White Pine as a mining district, are, 1st.—Its favorable local conditions. 2.—Great quantities of ore at a small depth. 3.—The character of the ores; being, in most of the mines, such as to admit of amalgamation without roasting, with splendid results. I have extracted 90 to 94 per cent. of the silver of the White Pine ores, as chloride.

ACCURACY OF SHOOTING.—The barrel and its rifling are intended to give direction to the bullet and to confine the power imparted by the liberation of the gases, until this direction is assured. When these are assured the benefit of the barrel's length ceases. In common use it is found that a barrel of 20 inches is as good as one of 32 inches in length. The ordinary Colt's pistol, navy size, barrel eight inches in length has been known, when well constructed, to project a ball accurately a distance of three hundred yards.

Mining in Placer County.

Bath (formerly Sarahville), Placer County, is the liveliest little place that I have seen through these parts. There are two mills running.

THE PARAGON MILL

has twenty stamps; it is owned by Wright & Day, obtains its material out of a tunnel 2,600 feet long, and is doing well. A clean up was made on Sunday last, from a week's run, night and day, and the result was $2,600.

THE ROUGH GOLD COMPANY

are in 2,000 feet; they are working only in the day time at present, though it is the intention to run both night and day after next week. The mill has ten stamps, and produces satisfactory results in the way of substantial returns. More men will be put to work in the mine in about two weeks. I went through the mine; it looks very well. I could see specks of gold in the gravel.

FOREST CITY

is at a stand-still at present, but they are expecting to have lively times in the rainy season. All the mills are standing still.

THE BOYS AT LAST CHANCE

are making arrangements to get some men to carry the mail up to them this winter. Six miles from Last Chance a good quartz vein seventeen inches in width, has been struck by R. M. Richards. The prospects are very good. He is in only four feet, but has taken out over $100, by pounding the ore up in a mortar. W. H. M.

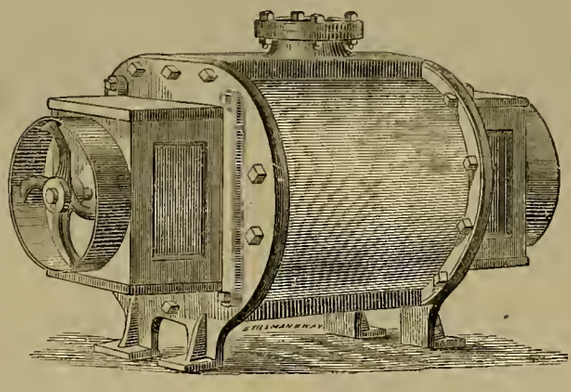
M. M. COOK & SON.

Hose and Belting.

Fire, Hydraulic Hose and Leather Belting, made of the heaviest and best quality of Oak-tanned Slaughter Leather. Also, Fire Buckets, Suction Hose, etc. Our Belting is well stretched, cemented and warranted to run true, and our Hose guaranteed to give satisfaction. A large assortment always on hand and orders promptly filled. No. 601 Battery street, San Francisco. 13v16 3meow



A WARNING
TO ALL WHO ARE AFFLICTED.

Before the rainy season comes get cured of Rheumatism and Neuralgia, by herbsonly. The receipt was given some years ago by an old Indian in New Orleans, and it has never failed to cure all it says. Many have been cured in this city and in Boston, and all say it is the best they have tried. Manufactured by MRS. MARY HIGGINS, Oregon street, two doors west of Drumm. Orders sent by mail or express attended to on receipt of $5 per bottle. 22v17-3m

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

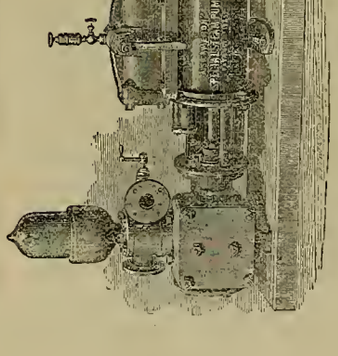
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.



CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

HANSCOM & CO.

THE FOLLOWING ARE SOME OF THE SPECIALITIES OF THE WORK AT THIS ESTABLISHMENT.

HANSCOM'S ROCK CRUSHER.

The best of the kind in use. Right secured by U. S. Letters Patent.

VARNEY'S IMPROVED QUARTZ GRINDER,

Which only needs examination to be appreciated.

HAYES' IMPROVED STEAM PUMP.

For pumping out mines or pumping water in any way, this is considered by miners and engineers as superior to anything now in use. Parties on this coast now using them will attest to their efficiency.

HOUSE FRONT CASTINGS.

We claim to make the best castings of the above kind of work now made on the Pacific Coast, and think that a reference to our work will bear us out in the assertion. We would call the attention of the public to the following Iron Fronts made by us for good work, to wit: Firemen's Fund Insurance Building; San Francisco Savings Union; the New California Market; Chas. Land's Building, on the corner of Sansome and Bush streets; Dooly Block Company's Building, on the corner of Sutter and Sansome streets; Kennedy's Warehouse, corner Broadway and Battery streets; Livingston's Building, corner California and Battery streets; the new Calvary Church Building, corner Geary and Powell streets; new Theater, on Bush street, and many others that we have not space to mention.

VARNEY'S NEW PAN.

Mr. Varney, by long practical experience and close study of the working of Pans, has succeeded in bringing his Pan to great simplicity and perfection. All parties interested should make it a point to examine the new improvements, as it will well repay for the time so spent.

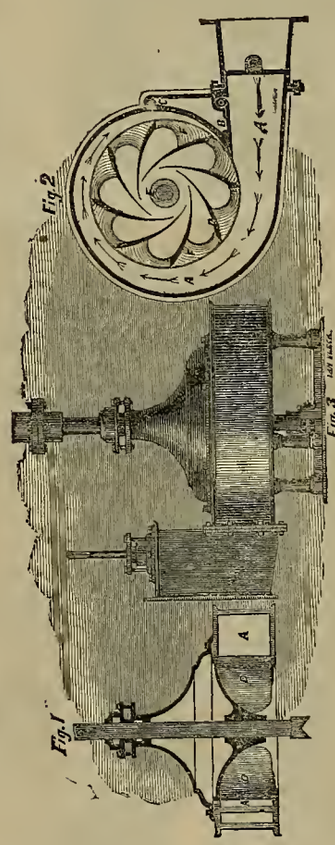
DUNBAR'S PATENT PISTON PACKING,

With Smith's improvement. There are of this Patent upwards of *three hundred* in actual operation on this coast. It requires no springs or screws, is always steam-tight, without excessive friction, and never gets slack or leaky. Any amount of recommendations can be given on application.

ORNAMENTAL CASTINGS.

We have established a special department for Ornamental Work, Stove Plate, Piano Plates, and all kinds of Fancy Castings, to which public attention is respectfully called.

J. O. HANSCOM, H. S. SMITH. | THOS. PENDERGAST. W. W. HANSCOM.



HANSCOM & CO.,

ÆTNA IRON WORKS,

S. E. corner Fremont and Tehama streets,

SAN FRANCISCO.

TYLER'S IMPROVED WATER WHEEL.

It gives Greater Power at lower cost than any Wheel in use.

All Wheels warranted to give the power as set forth, or

The Money will be Refunded.

PRACTICAL MACHINISTS AND IRON FOUNDERS,

—MANUFACTURE—

Steam Engines, Quartz Mill Machinery,

SAW MILLS, FLOUR MILLS,

And all other kinds of Machinery that may be desired.

HANSCOM & CO.

JOHNSON & BURCH'S PATENT EUREKA CLUTCH AND BRAKE.

The Clutch is extremely simple, and can scarcely, by any possibility, get out of order, and will never wear out, except by decay or decomposition of the material of which it may be made. It is designed for hoisting purposes generally, and is just the thing for miners. We should not then hear of the mining accidents which occur daily from the giving away of hoisting gears. Parties using them in stores in this city give some of the best kind of certificates of their value over any other kind of Friction Hoist.

W. W. HANSCOM'S IMPROVED DOUBLE-ACTING STEAM PUMP.

Being made of only five pieces of metal, and having only two movable parts, it is considered by experts to be the simplest and best feed Pump ever invented.

CARVALHO'S PATENT STEAM SUPERHEATER

A very valuable invention for economy of steam, suitable for all purposes of heating and drying steam. Recommendations from parties using them in this State can be had on application.

BEMIS' PATENT GRATE BAR,

For burning screenings and fine coal, soft or hard. This is a very valuable invention and has done more for the benefit of California coal mines than anything else. By the use of this Grate Bar, all the debris and screenings can be used which formerly had to be thrown away. It is in use in about all the steamers on this coast and for many land boilers. All parties using coal will find it to their advantage to use these Bars.

BROWN'S PATENT LOW WATER REPORTER.

A safeguard against explosions and the burning of steam boilers from low water. Has been in successful operation for the past seven years in the States, and has established itself to be what the public requires. It is both simple and cheap.

THE ROSE PATENT SHEARS AND PUNCH.

Manufacturers of this excellent patent, specially adapted for country Blacksmiths. Always on hand.

G. T. BOHEN'S PATENT CESSPOOL COVERS.

Sole manufacturers of the above patent. Castings always on hand.

All of the above mentioned articles were on exhibition at the Mechanics' Sixth Industrial Fair, and the attention of the public is respectfully called to the merits of each article as set forth.

MINING AND SCIENTIFIC PRESS.

Subscription, $3 Per Annum. Single Copies, 15 Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

BY DEWEY & CO., Patent Solicitors. SAN FRANCISCO, SATURDAY, DECEMBER 26, 1868. VOLUME XVII. Number 26.

SEE INDEX on last page, which embraces the contents of this number. A perusal of this carefully prepared index will give the reader some idea of the large amount of varied useful information contained in six months' issues of the MINING AND SCIENTIFIC PRESS. The editorial labor bestowed on the PRESS is equalled by but few weekly papers in the United States.

The Sea Wall of San Francisco.

ENGINEERING DATA REGARDING THE CITY FRONT.

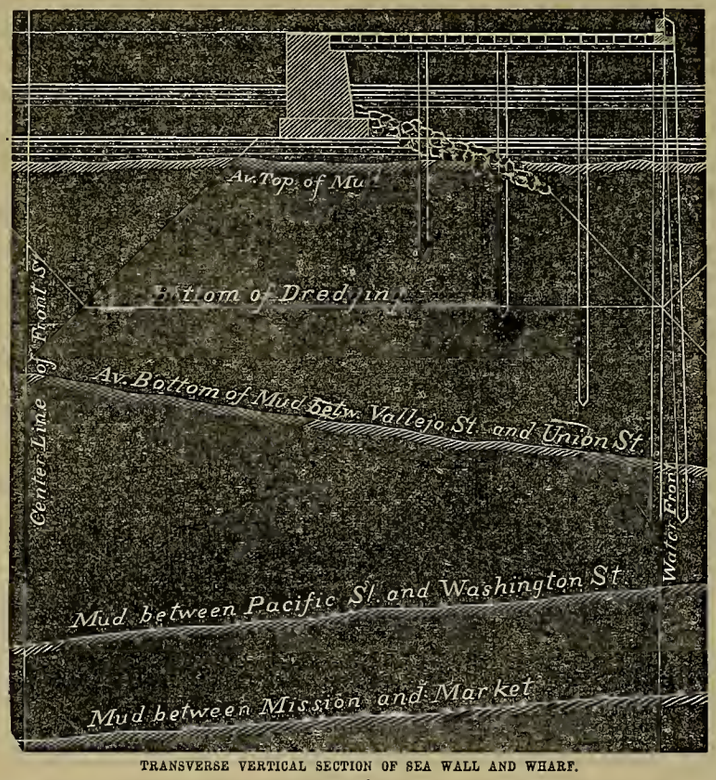
The accompanying drawing exhibits a transverse vertical section of the sea wall and wharf now in progress of construction along the water front of this city.

No other question can be of such vital importance to the approaching future of our great city and its destined commerce as the proper construction of a permanent pier and harbor frontage. We found the sands of Yerba Buena pure, and the transparent waters of the bay rippling cheerfully in 1849. We are bound, from motives of sanitary prevention and of trade, no less than from motives of pride, to see to it that we do not make out of it a permanent sink of pollution—a consummation which would bear down to posterity a stigma upon the race which, having come to gather gold, built filthy cities in clean places, unconscious of their destiny.

Fortunately it is not necessary to argue the point. Citizens, merchants and legislators are agreed that a first-rate sea wall *must* be made of it. George Oulton, in 1863, drew the bill; and the Harbor Commissioners since then have been carrying out the work, as below described.

The seeds of all true national greatness and heroism, like that so distinctive in Greece and Rome, and in the history of England, have invariably been laid in the republican principle, the substance and purport of which is, or ought to be, that individuals and cliques shall not be suffered to run counter to the general welfare. Wharf-holders and officials of the sort whose faces indicate an ownership of lax and oily consciences, must not be permitted in any manner to thwart us in accomplishing eventually that which the situation and necessities of San Francisco imperatively demand—a solid stone city front.

By Act of the Legislature, all the streets in front of the city have a uniform width of 150 feet, the outer half, or seventy-five feet of which is under the jurisdiction of the Harbor Commissioners, acting for the State of California. The following description, condensed from the specifications, explains the character of the work:



A pit or channel, sixty feet wide at the bottom, at a level of twenty feet below mean low tide, is excavated, and in this channel is placed the foundation of the sea wall, consisting of a rock embankment thirteen feet in width on top, at the level of mean low tide. The outer extremity of the excavation corresponds with the city front, and, consequently, at this point, the slope of the rock embankment is twenty feet below mean low water. The stones are thrown *pell-mell* into the bay, beginning on the center line of the embankment, and are allowed to settle until they reach a firm foundation.

When it is ascertained that the settling has ceased, a body of concrete, two feet in thickness and ten feet in width, is laid upon the embankment, and upon this concrete is constructed a wall of solid masonry. This wall is seven feet and three inches in width at the bottom, and nine feet and eight inches in hight. It is vertical on the land side, and on the harbor side has a batter of two inches to the foot for seven feet and eight inches, where there is an offset of two feet, forming a recess to receive the ends of the timbers of the wharf. From this offset the wall is carried up vertically two feet, making it four feet in width on the top.

The masonry will have hammer-dressed beds and joints, and the vertical joints will be dressed back twelve inches from the face with a bevel of one inch, to secure the stone from displacement by the action of the waves. The mortar joints on the face not to exceed one-fourth of an inch in thickness; the face of the wall not to be hammer-dressed, but to present a rock face, except along the joints, which shall be dressed with a draft on each stone of three-fourths of an inch in width.

The stone will be dressed before laying, and will not be moved after being placed in the wall.

The bench of two feet in width, and the top of the wall, will be hammer-dressed to a uniform surface; the upper course or coping will be of granite for the whole width of four feet, and the stone will be so placed as to show on the top of the wall

TRANSVERSE VERTICAL SECTION OF SEA WALL AND WHARF.

The top of the wall is four inches below the official grade of the city, and the face of the wall at the top is forty feet distant from the line of the water front.

The wall will be of the form and dimensions shown in the above drawing, and will be of the best quality of first-class masonry. It will be built in regular courses of the following thickness, beginning at the bottom, namely: twenty, nineteen, nineteen, eighteen and sixteen inches, to the offset of two feet, above which there are two courses of twelve inches each, making in all nine feet and eight inches in hight.

The front will consist of Folsom or State Capitol granite, will be laid with alternate stretchers and headers, and each course will break joint with the course below it. No header will be less than five feet in length. The stretchers in the three lower courses will be not less than two feet, and in the remaining courses not less than eighteen inches in width.

no joint more than one-fourth of an inch in width.

The rear of the wall will be constructed of other first-class stones, to be approved by the Engineer and Board of Harbor Commissioners. The stone will be laid on horizontal beds, and the front and back of the wall carried up simultaneously. They will be well bonded together, and every course thoroughly grouted. The whole masonry will be laid in the best quality of hydraulic mortar, composed of three parts of sand to two parts of Benicia cement, or cement of first quality, to be approved by the Engineer, and all the joints on the face will be pointed with a cement of proper consistency.

The action of the waves will form the face of the rock embankment approximately as represented in the drawing. If the embankment should be washed away to a steeper inclination, it will be replaced before building the protection wall. If it shall not have settled or washed away down to the line represented, the surplus material will be removed.

As soon as any portion of the granite wall is built, the corresponding portion of the protection or *rip-rap* wall in front of it will be constructed in the form represented in the above drawing. The *rip-rap* wall will be three feet in average thickness, and the upper surface will have an inclination of one vertical to three horizontal, and will, at its lower end, be at least seven feet below mean low tide. At its junction with the granite wall, the upper surface will be at least four feet above mean low tide.

It will be constructed of hard rock, not liable to be broken or decomposed by the action of the waves, to be approved by the Engineer and Harbor Commissioners, and no stone will weigh less than five hundred pounds.

The stones will be lowered to their proper position by means of derricks, their ends facing the prevalent waves, and will be well wedged together.

A sewer is designed to pass through the middle of every street intersected by the sea wall. Through the wall a brick sewer with granite facings will be constructed; and through the earth embankment, from the termination of the brick sewer to the outer slope of the embankment, a timber sewer. The form and dimensions of the sewers will correspond with those used by the city in the respective streets.

The back of the sea wall will be forty-four feet distant from the line of the water front, leaving thirty-one feet to the middle of the street. This space back of the wall is to be filled in with earth embankment, the inner side having a slope of one and a half horizontal to one vertical.

Sufficient funds having been received by the State Harbor Commissioners to pay for the construction of a portion of the sea wall, in May, 1867, William J. Lewis was appointed Engineer of the Board, and the specifications having been prepared by him and approved by the Board, three sections were advertised for contract. The money in hand not being sufficient for the construction of the three, the proposition of A. H. Houston, he being the lowest bidder for the two upper sections, was accepted, and a contract was executed on the 23d of July, 1867, with him for the construction of the first division from Union street to Vallejo street, in length 650 feet, at $217 per lineal foot, or for the aggregate amount of $141,050; and also for the construction of the second division, from Pacific street to Washington street, in length 743 feet, at $278 per lineal foot, or for the aggregate amount of $206,554.

The stone and earth embankments for the above sections have been completed, and to expedite the settling of the embankment, a space twenty-five feet in width east of the water front, at the depth of twenty feet below mean low tide, has been excavated. Also for the accommodation of the business of the port, a wharf has been built on the first division between Union and Vallejo streets, and has been several months in use. This wharf is constructed on the general plan, but so that only a small portion of it need be taken up, to allow of the construction of the vertical and protection walls. The granite required for the vertical wall has been quarried and dressed, and the building will be commenced early in the ensuing year.

[Continued on Page 404.]

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Nevada Silver Ore Deposits.

CHARACTER OF THE COMSTOCK LODE.

My object now is to present my views,—to give my opinion as briefly as possible,—with regard to the Comstock Lode as a true vein; and before proceeding, I will state that this opinion shall be based principally on developments made in the various mines located on this lode within the past year. When I compare recent developments in the various mines here, with my experience in Central Mexico and other mining regions, I am forced to believe that the Comstock is not a true vein, and my opinion is conclusive that another six months or year will demonstrate this fact to the satisfaction of every experienced miner who will take the trouble to investigate this matter properly.

I believe the Comstock Lode, so called, now presents every indication of belonging to that class of metalliferous deposits known as beds or segregated veins. These segregated veins differ from true veins in many respects, which I have not time to describe; but practically speaking, the most important features of this class of deposits are: *First*—they almost invariably lie parallel with the stratification and clevage planes of the formation in which they occur—which is the gneissic and schistose portion of the metamorphic palæozoic rocks. *Secondly*—they cannot be depended upon in depth, for it seems they are almost always richest near the surface, frequently terminating altogether at no very great depth. Nor is the metallic matter distributed through them with as much regularity as in true veins; forming often a series of pockets of ore, ranged in a linear direction, and connected by mere threads of ore, or barren veinstone.

There are a great many illustrations of this form of deposits, but as the most striking ones to correspond with the Comstock, I will first mention the celebrated mines of Corro Pasco, in Peru. The superficial yield and development of the principal mines in this district has been enormous, but all the ore deposits, which, for a considerable depth below the surface, yielded so immensely, have grown sensibly poorer in descending upon them. Rivero, and other learned mining engineers, consider the Pascos of Santa Rosa, one of the richest mines in the Pasco District, not to be in a true vein; but a bed, the hanging and foot-walls being of different character, and the gangues having no crystalline or comby structure.

The Potosi mines of Bolivia, have likewise yielded immensely from the rich bonanzas found near the surface, and at one time the average annual yield of these mines exceeded the annual product of the Comstock; but when the extensive and rich bonanzss found near the surface were exhausted, the anuual yield fell off to less than one million dollars, the lower levels failing to produce pay ore. The Rammelsberg, in the Hartz, furnishes a still more striking illustration of the form of segregated vein deposits. At a depth of four and five hundred feet, this vein had a productive width, sometimes exceeding 150 feet, and 2,000 feet in length, but at the depth of 800 feet, the vein gets poor, and narrows down from 150 feet to 20 feet in width, and from 2,000 feet to 700 feet in length. This vein also dips with the stratification of the inclosing rock, and the body of the deposit is found very irregular, the ore occurring in bonanzas.

Professor Castello, of the Mexican College of Mines, in a learned essay, which was submitted to the courts, says that in following a vein, if its dip varies much from forty-five degrees, there is reason to believe that it is not a true vein, which will soon lose itself. Other learned mining engineers, who have recently examined the Veta Madre, of Guanajuato, Mexico, pronounce it a bed, or segregated vein, as it has a direction coincident with that of the adjoining strata, and gets narrow and poor as depth is attained. I could call the attention of the reader to numerous other instances where veins of this character occur, and where they are invariably found either too poor, or giving out altogether at no great depth below the surface; but it is useless. Unlike the Comstock, their development and product for a certain depth below the surface, has been enormous.

A careful study and close observance of the character and pitch of the Comstock Lode, as at present explored, must at once suggest some very important points for consideration. The first and most important one is, that this vein, as now shown in the deep levels of the Chollar, Gould & Curry, Ophir, Bullion, Alpha, Belcher, and other mines, must soon change its extraordinary eastern dip and become more vertical, or dip west into the mountain, or else no-pay ore is likely to be found below the present levels of the various mines, and the theory of this being a true vein, explodes, and must soon fall to the ground.

Possibly, the vein, when it changes its dip from west to east, about 300 feet below the outcrop, may have been faulted by a dyke or bed of hard rock, as in the case of the Chañarcillo mines, in Chili, where at certain depths the ore is found to be cut off by *mesas*, or tables of hard porphyry; but this does not seem probable, as several drifts have already been run a considerable distance west into the hard feldspathic greenstone, of which the mountain range west of the vein is chiefly composed. Thus far, no evidence of a fault of this character, or a change in its dip, can be discovered; on the contrary, at a depth of 800 and 1,000 feet below the outcrop of the vein, in some instances, as in the Chollar, Belcher, and other deep levels, the foot-wall comes sweeping east, under the vein, at an angle of 80°, apparently meeting the east or hanging wall, and cutting out the quartzose matter entirely. The general course of the Comstock is north and south dipping east, at a very high angle, and invariably with the stratification of the inclosing mountain rock. The extreme width of the vein in some places near the surface appears to exceed 600 feet, while at a depth of 900 and 1,100 feet, it narrows down to fifty and thirty feet, the gangue at these lowest points carrying little or no quartz, and if quartz is found, it is generally of a hungry-looking, worthless character.

The ores are the various and complex sulphurets and chlorides of silver, which are found in kidney-shaped nests and deposits of varying extent, more frequently lying close to, and parallel with the hanging wall, and generally connected by mere threads of ore, or barren veinstone. As far as I am able to judge, but a limited amount of low grade ore remains in the levels of the various mines now open, and unless pay ore in sufficient quantity is soon found in deeper levels, there can be no reaction in the stock market, founded upon a firm and healthy basis.

The theory and principal subject of this letter is one of considerable importance, comprehending as it does the very basis of future prosperity in mining here; but they are my own views and conclusions, drawn from comparisons and personal experience and inspection. I give them to the public, hoping they may be found of interest to the readers of this article, and believing that every person has the privilege of expressing his honest opinions, especially in matters of this kind.

Having recently visited the new district of White Pine, in southeastern Nevada, I am also enabled to give you my opinion concerning that interesting country. [Next week.—Ed.]

Instruction in the Industrial Arts. A practical philanthropist in Massachusetts has founded a free industrial institution, to provide instruction for young men in branches not taught in public schools; and for this purpose there are departments of farming, mechanics, engineering, architecture, metallurgy, chemistry, mining, teaching, etc., etc. Several hundred thousand dollars are already provided, and one generous donor has given a spacious machine-shop, completely fitted and furnished.

[Written for the Mining and Scientific Press.]

Our Idaho Correspondence.

FROM A RESIDENT CONTRIBUTOR.

Editors Press:—Your columns seem to contain but little news, and that only in a condensed form, in regard to Idaho Territory, and although even those papers that a year or two since took the greatest pains to try and ignore this as a terra incognito, and would have had it looked upon as the ancient Gauls did on the Island of Britain—as too full of horrors for civilization ever to reach—are beginning to recognize that there is such a place as Idaho, and that the said Idaho may possibly have a "few" ounces of gold and silver scattered throughout it, yet they fail to see its value, and refuse to allow it any important position amongst the gold and silver-producing localities of this continent.

First, then, Idaho Territory extends from Nevada on the south to the British possessions on the north; and from the Rocky Mountains on the east to Oregon on the west, and is large enough for at least four good-sized States. The mining localities in the southern parts of the Territory are, Owyhee County, Alturas County, Boise County, and now Ada County is also being brought into the "ring."

Yuba, is the principal district in Alturas County, and the Leonora, the most remarkable lode there. The gold is in leaves of about the thickness of ordinary writing paper, with layers of quartz between, and this streak is from two to six inches thick, and is reported to be widening. Mr. William Defrees is working it with a 10-stamp mill. The much-spoken-of Atlanta, is a lode very rich, sometimes even 40 per cent. in silver; but there is so much antimony with it as to render it very difficult to work, and I am informed the owners say that they cannot save but a small proportion of the silver. The Lucy Phillips Company, (English) Dr. Edward Bishop, director in charge, purpose to rent their mill at Quartz Gulch, in the spring, and to go ahead.

The Monarch Company are crushing Atlanta rock, and report good results. Several lodes have been much developed during the past summer.

The Pacific has been opened by shafts and tunnels, over a length of 2,700 feet, and the vein found in various places at fifty to seventy feet perpendicularly below the ground. The lode is from fourteen to twenty feet wide, and fourteen tons taken from the shaft of Johnson & Co., worked in an arastra, yielded $22 per ton in gold, but by this, all the silver, which an assay shows is a large percentage, is lost, and much gold also. This was rock just as it came from the shaft, and was not picked over.

The Golden Wreath also is in the same position, having been opened and explored for a continuous distance of nearly 3,000 feet, and the shafts, tunnels and cuts, at various points, are from ten to forty feet deep, showing the true vein with its smooth casings. A test of a few hundred pounds in a mortar yielded nearly $25 per ton.

The Great Mogul and Olive Branch have been also so far developed as to show that they are true veins.

The Varieties is another lode that stands very high, but the owners, William L. Johnson & Co., will not part with it, except for cash. I saw a bullion brick from it, valued here by our assayers at $402.50, the result of ten tons worked in an arastra.

The visit in August of H. Gesheing, Esq., of the Lucy Phillips Co., of London, will benefit this camp, as that gentleman was much impressed with the wealth he saw, only wanting money to take it from its natural vein and put it into circulation.

The Owyhee County mines, having had the time and capital expended on them, are better developed, but are not in point of true richness anything ahead of Yuba.

The Golden Chariot is almost fabulously rich, and yet the lodes are small, and cost much more to work than at Yuba. For instance, at Yuba, a 400 foot tunnel will strike the Pacific lode at least 300 feet under ground, and ore can be quarried and delivered at the mill, (if erected below it on Grouse Creek) for $3 per ton, at present high rates of labor, ($5 per day). Again, the advantage of wood and water is great over Owyhee, but the nearness to traveled trails was what brought Owyhee out first. Now, however, the railroad will pass not over sixty miles from Yuba, and will be the making of that place, and bring wealth to it only to take away for distribution those precious metals that for untold cycles have been waiting to be called forth, for good and for evil, at the hand of man.

The climate of Yuba is preferable to Owyhee. At Yuba, the warm springs keep it more temperate, whilst at Owyhee, the snow-storms and continual and terrific winds during winter, are evidenced by the few trees they have. Still Owyhee, as far as wealth of ore is concerned, stands high in the mining districts of the world, and will yet, when it gets out of its infancy, enrich many.

The mines of Boise County are apparently doing better than formerly, and in all probability, as managers understand more fully the nature of the work they are at, it will turn out good results. The Elk Horn Company are doing well.

But I am making this letter too long and will close, but you may look for a renewal of the reports of this Territory, with full and complete details of all the leading mines in a series of letters, at distances of about two weeks each.

Yours, respectfully, Alturas.
Boise City, I. T., Dec. 9th, 1868.

Land Office Report for 1867, by Jos. S. Wilson, Commissioner. The Land Office Report for 1867 is an octavo volume of 171 pages, containing the reports of the U. S. Surveyor Generals, embracing a large amount of valuable information concerning the resources of the new sections brought to their cognizance through the actual surveyors; together with a very large map of the United States, showing the present status of the public surveys, the boundaries of the land districts, and representing as far as possible, all the known mineral locations and discoveries, especially westward of the great plains. About half of the Report is of a general character, containing valuable mineralogical and geological notes and statistics, and embracing, amongst others, articles on the following subjects:

Homestead policy considered with homestead rulings; results shown.

Relation of foreigners to real estate in the United States. Laws respecting naturalization.

Laws respecting the suppression of timber depredations and measures taken in that respect.

Swamp and overflowed land concessions; results submitted; further legislation recommended.

Geological survey of Nebraska; results reported under legislation in that respect.

General views as to the extension of such explorations.

Pacific slope; its extent; also its importance shown in an agricultural, mineral, and commercial point of view.

Relations of the United States to the trade of the Orient.

An account of the gold and silver producing countries, the amount taken from the mines since the discovery of America, with a summary of the mineral wealth of the United States.

Freaks of the Morning Star.—At Virginia City on Nov. 29th, the morning star rose of a blood-red color and with a bright white halo, apparently five or six feet in diameter surrounding it. From the lower part of this halo there extended downward a tail, apparently some eight feet long and two feet in width at the upper part. This tail was slightly curved, of a saber shape, bluntly rounded at the lower end, and both it and the halo appeared to be filled with thousands of small and exceedingly brilliant stars. This strange sight lasted some 15 or 20 minutes, or until the star had risen so high that the tail of the halo appeared to be two or three feet above the top of the crest of the distant range, when it suddenly faded out. As the homeward bound miners with dinner pails in their hands, stood gazing upon the singular phenomenon, they predicted earthquakes, hurricanes and all sorts of spasms and convulsions in earth and air.

Mineral Resources of Alabama.—A survey is recommended by Gov. W. H. Smith, of the Coosa, Cahata and Upper Warrior rivers, on or near whose shores some of the richest coal and iron mines of the State are situated. Such surveys would, he thinks, promote the interests of the State by attracting northern capital to open the navigation of these rivers and develop the mining resources of the districts lying upon or near their courses.

Mechanical.

THE MONCRIEFF BATTERY.—The English papers are eloquent upon the invention of Capt. Moncrieff. A gun weighing six and a half tons is handled as easily as a rifle is handled by a sharp-shooter. It is brought down behind an earth parapet to be loaded, and elevated above it to be fired. This is accomplished simply by the *recoil*. The very thing that has always been the greatest trouble to artillerymen is, by this invention, made useful. The discharge of the gun causes it to roll easily backwards and downwards, as a rifle would do if fired when poised upon the back of a rocking-chair. It is caught at the proper point by mechanism, and held while it is being loaded; being then released, a counterpoise causes it to rise as easily into its place above the parapet, where it is discharged. Its horizontal position is maintained throughout. The gunners are never exposed; even the *aim* may, by means of reflecting sights, be taken without a man showing his head. The inventor proposes to place the gun in a pit, like that used by riflemen. Fancy a six-ton monster suddenly rising from beneath the surface of the earth, belching forth its fire, and as suddenly disappearing into the hell from whence it seems to have come!

GJER'S STEEL-MAKING PROCESS.—In this process, as described in *Engineering*, "puddle bars or other iron, or steel bar stampings, iron or steel scrap, are cut up and are dipped into a mixture composed by taking, say, 100 parts of coal tar, 50 parts iron ore, 25 parts manganese ore, and 25 parts of slacked lime, with more or less of oxides or of lime, according as a harder or a softer product is required, or, if necessary, more carbon, in the shape of charcoal. After this prepared material has been dried, it may be melted in crucibles or on the bottom of a reverheratory furnace; but it is preferred to use a continuous molting steel furnace. For this purpose, Mr. Gjers employs a Siemens regenerative gas furnace, formed with a deep receptacle in the center to contain the liquid steel; and either over this receptacle, or by preference around or on each side of it, he proposes to set one large tube or retort, or preferably a number of smaller tubes or retorts, made of material capable of resisting great heat."

THE DUROMETER.—M. Behrens, a French engineer, has given this name to a machine which he has invented for the purpose of testing the hardness of metals by drilling. The shaft which drives the spindle of the drilling tool has a worm upon it, that moves certain mechanism connected with a signal gong, which indicates the number of revolutions made by the drill. Many French contracts for rails now contain a condition that they are to be tested by this apparatus.

TO KEEP BOILERS CLEAR FROM SOALE. The *Scientific American*, in conformity with the experience of one of its correspondents, recommends that the drippings of the exhaust pipe, and the condensation of the safety-valve blow-off, and of the cylinder, be all saved and used to fill the boiler after blowing off. The effect in loosening scale will be surprising. The correspondent alluded to attributes this to the oil used about the cylinder, which becomes mixed with the exhaust water. A surface blow-off is also recommended.

IRON TELEGRAPH POSTS.—On the Creusot line of railway the wooden telegraph poles have been replaced by iron supports, firmly fixed in posts of stone solidly fastened in the earth. The supports are composed of three rods of flat iron set triangularly at a slight distance from one another, so that the angles of the triangle may form a sort of open work, being bound to each other at regular lengths by loops of iron riveted to the bars, and forming a substantial small column of very elegant appearance. The insulators are fixed on the rods by means of a plate and two rivets. These posts are very firm; they bear the lines admirably, and are of almost illimitable durability.—*Colliery Guardian.*

MARINE ENGINES.—We condense the following from *Engineering*: "All competent engineers are fully aware that in the running of steam vessels not more than one-fourth of the power of the coal is utilized commercially in work. There is the heat wasted in radiation, the heat which goes up the chimney, and the coal lost in the ashes. There are all the losses due to the difficulties in attaining the theoretical advantages of high expansion—difficulties represented by huge cylinders or excessive speeds of piston, and by condensation within the cylinder itself. And there are the losses in the friction of the engine and screw shaft *per se*, the additional friction due to the load, the cohesive resistance of the water opposed to the screw and the slip of the screw itself. Besides all these there is still the large loss, in the majority of steamers, of the heat contained in the brine, amounting to one-third or one-half of the whole, blown from the boilers, fed as they are from the sea. * * * The simplification of the marine engine has been carried almost as far as is apparently possible, unless a better fortune should send us at last a really good rotary engine, and how many, many trials have been made to attain this *ignis fatuus!* As for the propeller, talk as we may of negative slip, there must always be a certain recession of the water from any propelling instrument pressing against it.

We are to look for the possibility of further improvement chiefly to the gradual increase of pressure, expansion, and piston speed. There are experiments well worth trying, with the object of extending the application of wood bearings, and it is probable that the marine boiler might be further simplified, and the efficiency of its heating surface increased. The present comparative excellence of steamship machinery has been attained by repeated and often bold experiments.

ANOTHER STEAM HAMMER.—The London *Mining Journal* thus describes a steam hammer invented by a Sheffield man: "The whole of the working parts usually liable to derangement are kept out of harm's way by converting the piston rod into the slide valve. The hammer being upon the anvil, steam is admitted through the piston rod to the under side of the piston, which is lifted thereby until the passage connecting above the piston opens to the steam inlet, admitting steam over the piston. Notwithstanding this, the upward stroke continues until the passage which has supplied the steam to the under side reaches the exhaust port. The upper end of the stroke having been reached, the pressure of the steam supplied above the piston combines with the weight of the hammer to carry it down with great force, until the passage connecting with the under side of the piston again reaches the steam inlet. The admission of steam, and consequent speed of the hammer, is regulated and governed by a separate regulating valve, operated by the foot of the workman."

MOISIC IRON.—It is probably not generally known,—says the London *Mining Journal*,—that the Moisic (Nova Scotia) iron surpasses in strength the celebrated Low Moor iron by nearly five per cent. Its capacity for elongation is seven and one-fourth inches in ten feet. The analysis of M. Poinsat shows the ore from which it is manufactured to contain—magnetic oxide of iron, 51·12; protoxide of iron, 34·60; titanic acid, 11·27; and silica, 3·01 per cent. For boilers and iron shipbuilding, it is a very superior quality of metal. With regard to the facility for obtaining a permanent supply, Dr. Sterry Hunt writes that the bed of magnetic ore at the Moisic is of immense extent, readily accessible.

LIFTING LOCOMOTIVE DRIVING WHEELS. An apparatus has been patented by J. M. Ure, of Glasgow, which is designed to enable the engine driver to prevent the rotation of the driving wheels and movement of the pistons when an incline is being ascended, or when the locomotive is being brought to a stand-still on approaching a station. The apparatus is applicable to any locomotive that is sufficiently supported on other wheels when the driving wheels are lifted. The lifting is done by means of two extra cylinders, to which steam is admitted.

Scientific Miscellany.

THE AMIENS GRAVEL.—A paper by Mr. Alfred Tylor, F. G. S., published in the Quarterly Journal of the Geological Society for May, and given in full in *Silliman's Journal* for November, with several illustrative diagrams and two elaborate plates, takes ground in regard to the quaternary deposits of the Valley of the Somme, which is opposed to the view heretofore advocated by Sir Charles Lyell and other geologists of high reputation. These gentlemen have asserted, among other things, that the Valley of the Somme was excavated some forty or fifty feet since the deposition of the upper valley-gravel at Amiens, etc., and before that of the lower. Also, that both of these gravels were fossiliferous. The effect of these assertions was to refer the remains of man back to an indefinite date before the historical period. Mr. Tylor's conclusions, on the contrary,—distinctly proved, as he considers, by the diagrams, etc., aforesaid,—are that the chalk valley of the Somme was excavated exactly to its present form prior to the deposition of any of the gravel now lying in it; that this gravel is partly derived from *debris* brought down by the Sommo and the other existing rivers, and partly from material from the adjoining high grounds washed in by land floods; and that the quaternary deposits here and elsewhere indicate a Pluvial period, immediately preceding the true historical period. The illustrations accompanying the paper are from actual survey.

ACTION OF SUNLIGHT ON BISULPHIDE OF CARBON.—O. Loew, chemical assistant in the New York City College, gives the result of some recent experiments in *Silliman's Journal*. A quantity of the bisulphide was exposed to the sun in sealed tubes. Decomposition took place gradually, and a brown insoluble substance was formed. After two or three months the tubes were opened. The water was slightly acid in its reaction, owing to the production of a trace of formic acid. A filtrate contained free sulphur dissolved in the bisulphide of carbon; this compound corresponded with the sesquisulphide of carbon discovered by Mr. Loew two years ago. It was insoluble in water, alcohol, ether, chloroform, bisulphide of carbon, and oils, but soluble with decomposition in a boiling solution of caustic potassa.

TO DEODORIZE SULPHIDE OF CARBON.—Millon says: "It is only necessary to agitate the liquid well with an equal volume of milk of lime, and then distill off at a low temperature. Litharge and copper, and zinc shavings, remove the compounds which give the bad odor equally well, and may be used in place of the lime. Simple agitation with these bodies will take away the greater part of the smell. Purified by either of these methods, the sulphide only possesses a faint odor somewhat resembling that of chloroform, and it may therefore be used to remove grease, like benzine. It must be mentioned that, left to itself, the sulphide soon again acquires a bad odor, but this, it seems, may be prevented by keeping a little litharge or some copper or zinc shavings in the bottle."

LIFE AFTER DECAPITATION.—Dr. Claude Bernard has made experiments of which the following is one: If oxygenized blood be injected into the arteries of the neck immediately after decapitation, warmth and sensibility return, the eye gets animated, and displays such perception that an object shaken before it will cause winking of the eyelids and movements of the eyeballs as though to avoid injury.

A NEW EXPLOSIVE.—The artificial saffron invented by Mr. Mittenzweg, of Pöblitz, intended for tinging vermicelli, has proved to be explosive—a box of the compound having exploded by a spark from a pipe whilst it was being opened. Mr. Chevallier, of the Société d' Encouragement, has been unable by analysis to discover its composition. The substance ignites as readily as gunpowder, but its force of projection is 40 per cent. less.—*London Mining Journal, Nov. 7th.*

The Cucuyo.

This insect, the West Indian Fire Beetle, is described in an interesting paper contributed to the October number of the *American Naturalist*, by Dr. G. A. Perkins. We quote a portion of the paper:

"An examination of the peculiar matter upon which their power of luminosity depends, or in which it manifests itself, shows it to be composed, in a large proportion, of fat, in which are found some air-tubes and a very large supply of nerves. This fatty matter is of a chalky whiteness, and, when spread upon a slip of glass and examined by the microscope, gives the characteristic appearance of fat globules. When rubbed upon paper and warmed, it leaves a greasy stain; and when the whole mass is digested in sulphuric ether, the fat is dissolved out, leaving branch-like masses of nerves in great abundance, and also the tubes of the air-vessels. The mass of luminous matter upon the abdomen is many times greater than that upon the thorax, and is covered externally by a very delicate and flexible membrane, which forms the joint, and reaches completely across the animal. Inside it has not so distinct a boundary, the vessels of other portions of the body being continuous with it, the luminous matter still being quite distinct. In the thorax, this same substance is found lying behind the two oval, convex, transparent membranes, of a horny nature, being separated from it by a very thin transparent membrane, which acts as a special envelope, and is also supplied with nerves and air-tubes, as in the abdominal portion.

It becomes evident to any one who attentively examines these insects, that their luminous power is completely under control; that whatever arouses the nervous energy of the animal to full activity, causes a corresponding manifestation of luminosity; and, on the contrary, whenever the insect is placed in media which depress its vital powers, and act either directly or indirectly upon its nervous masses, then it ceases, wholly or in part, to give out its light."

The author quotes a letter from Cuba, the concluding portion of which we give:

"I saw a lady at the 'Rotreta' once, with a coronet and stomacher of them; and all the crown jewels of Spain could not have made her so resplendent. The light is not a flash, seen for a moment and then gone, like our fire-fly, but it is emitted in a brilliant, steady ray, at will, and is of extreme beauty of tint, being of a slightly greenish yellow viewed in some positions, and of pale red viewed in others. It is a touching fact, that the poorer classes, when severe sickness visits their dwellings, confine a half-dozen of the Cucuyos in a cage, and are thus furnished with a most beautiful and inexpensive light for night watchings.

THE CONSTITUTION OF THE SUN.—The following is from a paper recently read before the Royal Institute by T. Sterry Hunt. The hypothesis is due, as the author remarks, to Faye, "and seems to accord best with our present knowledge:".

"The sun is to be conceived as an immense mass of intensely heated gaseous and dissociated matter, so condensed, however, that, notwithstanding its excessive temperature, it has a specific gravity not much below that of water; probably offering a condition analogous to that which Cagniard de la Tour observed for volatile bodies when submitted to great pressure at temperatures much above their boiling point. The radiation of heat, going on from the surface of such an intensely heated mass of uncombined gases, will produce a superficial cooling, which will permit the combination of certain elements and the production of solid or liquid particles, which, suspended in the still dissociated vapors, become intensely luminous and form the solar photosphere. The condensed particles, carried down into the intensely heated mass, meet with a heat of dissociation; so that the process of combination at the surface is incessantly renewed, while the heat of the sun may be supposed to be maintained by the slow condensation of its mass; a diminution by 1·1000 of its present diameter being sufficient, according to Helmholtz, to maintain the present supply of heat for 21,000 years."

FREEZING THE BRAIN.—The discovery that the brains of a living animal could be frozen, and afterwards could recover, was made by Dr. James Arnott, who solidified the brain of a pigeon by exposing it to a freezing mixture.

[THE SEA WALL. -Continued from first page.]

On the 29th of September, of the present year, the preliminary advertisement having been made, and proposals received, a contract for the construction of the rock and earth embankmeuts from Washington street to Market street, including the protection and bracing of Clay, Commercial and Market street wharves, and the dredging of a channel twenty-five feet wide, at the depth of twenty feet below mean low tide, with the necessary side slopes, east of the water front, was made at the rate of $219 per lineal foot, or an aggregate amount of $159,745.17, and was awarded to A. H. Houston, the contractor for the preceding work. The embankment bas been completed from Washington street across Clay street, and also the dredging between Clay and Commercial streets. The coutract requires that the work sball he completed within eight months of the date of its execution, or by the 29th of May, 1869. From the progress already made by the contractor, there can be no douht that the work will be finished within the specified time. The mud south of Pacific street extends to a great depth, and considerable time must elapse before the embankment deposited shall be so firmly settled that a wall can be placed upon it without danger of cracking. For this reason, in letting the last contract, no provision was made for the construction of the vertical wall, and the State Harbor Commissioners wisely determined to use their means in preparing the solid foundation for the work.

We are indebted to Mr. Lewis, the Engineer in charge, for the information contained in this article, and to W. B. Treadwell, C. E., for the drawing, reduced from the original in Mr. Lewis' office, after which our illustration was engraved.

Corrected List of State Fair Premiums.

Our agent sends us the following corrected and complete list of gold and silver medals awarded at the late State Fair, at Sacramento; Mr. J. N. Andrews, of Sacramento, being at present engaged iu engraving the names and other lettering upon the medals, which will be done by January 1st, 1869, so that the successful exhibitors may expect to receive them as New Year's presents:

GOLD MEDALS AWARDED.

P. J Devine, for marble bust.

J. D. Patterson, for most meritorious exhibition of stock-sheep.

Pacific Iron Works, for steam engine with patent cut-off.

Mission Woolen Mills, for most meritorious exhibition of manufactured goods.

California Powder Works, for most meritorious exhibition in 4th department—powder.

Isidor Landsberger, for most meritorious exhibition of agricultural products—sparkling wine.

B. N. Bugby, for best exhibition of horticultural products—raisins.

SILVER MEDALS.

Detrick & Eckart, best balance oscillating steam engine.

W. T. Garratt, best display of brass work.

R. Rutter, floating battery.

H. Liebes, display of furs, 1st preminm.

Mrs. M. E. Garrish, best wax-work.

Pacific Saw Manufacturing Company, best circular, mill, hand and other saws.

Carlton Newman, best Califoruia glassware.

Pacifio Plate Werks, best California plated-ware.

Liddle & Keading, best California-made fire-arms.

Elam & Howes, best California wooden ware.

H. T. Graves, California Wire Works, best manufactured wire goods.

Strahlo & Hughes, billiard table and floor.

AN INDUSTRIAL ARMY.—The pay-roll of the Paymaster of the Central Pacific Railroad contains the names of over 1,200 employés in the work-shops of that company, in Sacramento alone. As the proportion of population in any city or towu is about five for each laborer employed in productive industry, it follows that six thousand of the population of that city is sustained by these work-shops.

New Patents Issued to Pacific Coast Inventors.

Especially reported by the U. S. Patent Office, Washington, D. C., to DEWEY & Co., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

FOR THE WEEK ENDING DECEMBER 1st.

84,470.—IMPROVEMENT IN ANTI-FRICTION BEARINGS FOR VERTICAL SHAFTS.—Rufus P. Barnett, Chas. P. Purinton and Nicholas Seibert, Nevada, Cal.:

1. In combination with the balls H, and their guide I, the universal joint formed hy the convex surface G, and the upper concave surface of D, substantially as described.

2. In combination with the balls H, and the above claimed joiut, the screw E, to adjust the same to the required elevation beneath the shaft.

The object of this invention is to provide a bearing for vertical shafts, such as ordinarily turn in a step, and which from their great weight, and the difficulty in properly luhricating them, are liable to frequent derangements, and it cousists in forming the end of the shaft of sufficient size and allowing it to rest upon three or more hard metallic halls. These balls rest upon a self-adjusting plate or table, which is so constructed as to keep them all in contact with the shaft, even when the shaft gets out of line. The halls are kept in place by a plate formed with openings of sufficient size to allow the balls to turn easily. This plate turns around a central spindle in the adjusting plate, moving with the halls.

84,497.—IMPROVED MODE OF WORKING GOLD AND SILVER ORES.—Guido Kustel, San Francisco, Cal.:

The ingredients or agents above enumerated, added to the ores in the manner and in about the proportions herein specified, for the purpose set forth.

84,516. — IMPROVEMENT IN PUMP-VALVE CHAMBERS. — Michael C. Taylor, Grass Valley, Cal.:

1. The diaphragm B, in a valve-chamber, and the valves C, C', operated by the levers D, D', substantially as and for the purpose described.

2. A double valve-chamber, having one ingress and egress-pipe, constructed substantially as and for the purposes herein described.

This invention consists in providing an improvement in valve-chambers for pumps, so that a continuous stream of water may be thrown from the pumps; and in case one valve should become broken or get out of order, so that its efficiency should be impaired, by simply turniug a lever the stream of water may be shut off, and turned through another valve which answers all the purposes of the first, while the injured valve is being repaired, thus producing a constant stream of water at all times and rendering it particularly valuable in pumping out shafts and other places where it is necessary to avoid stoppages in order that the water may not accumulate, and require much time and labor to reduce it.

84,565.—IMPROVEMENT IN ANCHORS.—Edmond P. McCarthy and James Johnston, San Francisco, Cal.:

The arm G, having the cam I, in combination with the arm D, with its flukes J, J, and the projections *c*, *c*, or an equivalent device, operating the arm G by means of the cam, the whole constructed and arranged, substantially as herein described.

This is one of those inventions in which two well-known devices are combined, for the purpose of providing a better one than either one singly, and it consists in combining with one shank two sets of arms and flukes operating at right angles to each other in such a manner that in whatever position the anchor falls, three of the flukes will be engaged, so that they are always certain to hold.

84,602.—IMPROVEMENT IN PROPULSION OF VESSELS.—Albert F. Yardell, Sau Francisco, Cal.:

1. The bar or truuk C, capable of contaiuiug cargo, arranged and operating substantially as described, for the purpose of communicating motion to the propeller of a vessel.

2. In combination with the tank C, the rod I, segment J, piniou K, gears L, L, L, ratchets P, and pawls P', arraiged and operating substantially as described, to give a rotary motion to the shaft M.

3. Interposing a coiled spring S, between the power-shaft and the propeller-shaft, for the purpose of equalizing or continuing the action of the power upon the propeller, substantially as described.

The nature of this iuvention is to provide an improved means of propelling vessels, without iuterfering with their sailiug capacity, or occupying much space required for freight. The device may he applied to all sea-going vessels, and consists in suspending a box or tank which is loaded or filled with freight or ballast above the kelson, so that the action of the sea, as the ship pitches, will swing this weight or tank to and fro, or forward and hack, and drive a propeller attached to the stern of the ship in the usual way.

84,617.—IMPROVED STEAM, GAS AND WATER STOP-COCK.—W. H. De Valin, of Sacramento, Cal.:

1. In a stop-cock in which the valve or plug is arranged within the case, in the manner described, I claim the combination of the valve with a disconuected flanged valve-stem, having its seat or bearing against the cap by which the valve-chamher is closed, aud held in place by means of a handle, arranged and operating substantially as herein described.

2. The combinatiou and arrangement of the valve-stem and cap for closiug the valve chamher, with the handle for operating the stem, and the cap and spriug for retaiuiug the handles in place, and holdiug said stem upon its seat, substantially as herein specified.

3. A stop-cock, such as described, having the valve-stem formed in two parts, hinged together above the point where the stem bears or fits against the cap, for closing the valve-chamber.

4. The recessed and grooved handle and knob, and the flanged or winged cap, in combination with the valve-operating stem, said parts being constructed and arranged to operate, as herein shown and specified.

84,652.—IMPROVEMENT IN GANG PLOWS.—Andrew Smith, Portland, Oregon, assignor to T. J. Carter and W. P. Watson, of the same place:

1. The combination of the lever O, having the offset *o*, with the ratchet P and R, having the teeth or shoulder *r*, and lever T, the whole operating substantially as and for the purpose described.

2. The arrangement of such frame, when constructed as herein described, in combination with a downward-bent axle D, the hox strap *e*, the braces H, H, the draught pole G, and the wheels F, F.

3. The arrangement of the clevis K, braces H, H, king-bolt C, cross-bar A, and axle D, the axle being behind the king-bolt, and the latter being supported by the braces and the cross-bar, substantially as herein described.

4. The braces *u* and *v*, attached at their lower ends respectively, to the mold-board and standard, and at their upper ends provided with screw-threads upon which are fitted, above and below the plow-beam, through which the braces pass, adjusting screw-nuts, substantially as and for the purpose specified.

SMELTING OF WHITE PINE LEAD AND COPPER SULPHURETS. — Mosheimer and others, constituting the "White Pine Smelting Company," have issued a prospectus to raise $50,000 stock, in shares of $50 each, for the purpose of erecting smelting works at White Pine, to operate on the ores of the "hase metal range." If the project is carried through, cupola smelting will be isattempted by th company, it being thought that the argentiferous contents of the ores will warrant that expense. From recent assays made in this city, it appears that the lead carries from $15 to $90 per ton in silver, with no antimony, and, as that can be readily smelted, it is supposed that it will be worked to good profit. Thousands of tons of this ore can be taken out almost from the snrface.

There are already smelting works at Silver Springs, which will be running by the 1st of February, possibly hy Jannary 1st, and if they work to advantage, additional furnaces will be erected as soon as spring opeus.

ELECTION OF OFFICERS.—BELCHER MINING Co.—Virginia City. Dec. 21st. Trustees: Messrs. Blauvelt, Edgington, Reynolds, D. C. Mackay and P. N. Mackay. It was also determined to remove their office to San Fraecisco, and to issue new stock, of which the par value will be $100 per share.

New Inventions.

A NEW GANG PLOW.—The Portland *Oregonian* has the following: Mr. J. Tustin, of this city, showed us last evening the model of a new gang plow invented by himself, and for which he has applied for a patent. It is as simple in construction as that of Mr. Mason, of Independence, while it has one or two important movements which Mr. Mason's has not. Thus two plows are attached to beams which are connected, one on each side, with the tongue, so that the stiff gear, so much admired in Mason's plow, is secured, either in plowing or traveling. The axle is merely an iron rod, with a crank at one end, and this is turned hy a hand lever oscillating hy the driver's side, to gauge the depth of the furrow. Thus the plows may be changed instantly to cut any depth from two to ten inches while in motion. In most gang plows, the driver has to stop and dismount to gauge his plows. Another hand lever raises the gang out of the ground by a quick, easy movement, the gang being exactly level all the time. A donble foot lever raises the gang at the nose or heel at pleasure, no matter whether iu or out of the ground, and serves to hold the nose down whenever, in passing through hard soil, it may incline to run out.

BREECH-LOADING GUN.—Joseph Gruher, a soldier at Fort Whipple, Prescott, has invented a new breech-loading gun, which is said hy the Arizona *Miner* to he very superior. He has applied for a patent through this office.

IMPROVED CAR FOR INCLINE SHAFTS.—The Nevada *Gazette*, of Dec. 11th, says: We have been shown a model of an improved car for incline shafts, invented by R. R. Craig, of this county. Tho truck is the same as that of an ordinary car, but is supplied with a safety coupling, so that in case of the breaking of the rope, the car would be stopped. The greatest improvement is in the box of the car, wbich is supported by a frame in such a way that it always in asceuding with a load, remains level. The frame revolves in such a way that the car may be dumped with equal facility on either side, or at the end. The model has been examined by a number of miners, who pronounce it a great improvement.

NEW STYLE OF STREET CAR.—The Central City Railroad Company have recently ordered a new style of street car, the peculiarity of which is that it has Stephenson's newly patented truck boxes and springs. The body of the car is hung to the track beneath by eight india rubber spriugs; two to each wheel, and so arranged that the car body can be swung any way from three to six inches, giving the car all the ease of motion of the most luxurious coach. The pole attachment has india rubber springs, which gives ease of motion in starting.

NEW STYLE OF HYDRANT.—Charles B. Ackerson, Second Assistant Engineer of the Fire Department, has invented a new hydrant, which will be more economical than the one at present in use. We shall mentiou this fully on receipt of the letters patent.

THE COUPLING FOR UNITING RAILROAD CARS.—The Sacramento *Record* says that Ogden Squires, of that city, has been engaged for nine months in perfecting a patent coupling for uniting railroad cars, by which they will couple themselves together without the aid of a man, as is now the case. The process appears to work well with the miniature cars whicb we have seen exhibited. If, when applied to the cars, it works as well, it will save many a human limb. The present system employed causes the men engaged in coupling cars, often to be crushed in body or limb.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office iu this city as follows:

POCOTILLA SILVER MINING Co.—White Pine, Nev. Dec. 22d. Capital stock, $800,000; 4,000 shares, $200 each. Trustees: J. M. Taylor, J. S. Josephi and Joseph Woodworth.

JEROME MINING Co.—Grass Valley, Nev. Dec. 19th. Capital stock, $1,000,000; 5,000 shares, $500 each. Trustees: L. W. Jerome, H. King, J. Baudman, J. W. Moyle and J. E. Richards.

CONSOLIDATED CHLORIDE FLAT MINING Co.—White Pine, Nev. Dec. 23d. Capital stock, $5,000,000; 50,000 shares at $100 each. Trustees: A. Hayward, A. E. Head, Thos. Sunderland, Thos. Bell aud W. B. Thomhurgh.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

San Francisco, December 26, 1868.

City Stocks.

Sales of miscellaneous stocks during the past week have been as follows: California Steam Navigation Co. at 52¼ and 53 (seller 30) per cent.; San Francisco Gas at $77; Spring Valley Water at $65.

The annual meeting of the Savings and Loan Society was held on the evening of the 22d inst., when the following Board of Directors was re-elected for the ensuing year: E. W. Burr, Benjamin D. Dean, Benjamin O. Devoe, Isaac Hyde, William Bosworth, R. J. Tiffany, Annis Merrill, J. W. Cudworth, T. L. Rutherford, H. L. King and J. M. Shotwell. At the meeting of the Board on the evening of the 24th, the following officers were re-elected: E. W. Burr, President; Cyrus W. Carmany, Cashier; and James O. Dean, Auditor.

The open sessions of the Board of Brokers were again suspended on the 19th instant.

The November receipts of the Cal. S. Nav. Co. amounted to $85,080; and the California, Oregon and Mexico Steamship Company, $58,356. Returns are made in currency.

For receipts of Insurance and Railroad Companies see third page of this Circular.

Mining Share Market.

The market for this class of securities has been characterized by a very fair degree of activity, the aggregate sales being quite large; however, stocks generally have declined from prices obtained early in the week, some showing a very material recession. This is due to accounts of less favorable results in the lower workings on the Comstock lode than had been anticipated some weeks past; but, independent of this unpleasant fact, a decline, for the time being, during the holidays is nearly always looked for, or rather always takes place when the attention of the public is diverted from the more legitimate channels of business.

We note the fact that some of the White Pine incorporated companies have already placed their stock in our market, and with the opening of spring we may look for a more general offering of these claims in the stock arena of this city. The following White Pine companies have recently been incorporated in this city: Aurora, Consolidated Chloride Flat, Pocotillo, and White Pine. The Aurora company has already gone to work in earnest. A contract for a thirty-stamp mill has just been closed, which will work from 8,000 to 12,000 tons per year, and at a greatly reduced price. This company will be found in our list on the fourth page. Col. J. D. Fry is President; J. F. Lightner, Secretary, and Capt. Frank Drake, Superintendent. This stock sold in the Board during the week at $25 per share.

Imperial—sold at $123@113 50, and at the close realized $113. By letter of the 22d we learn that clay has again been encountered in the shaft. This shaft will soon be timbered to a depth of 1,106 feet, and, after finishing the sump, will open a station at this point. It is believed that the new drift will strike the east wall of the ledge within about 100 feet of the 1,100 level, provided the pitch is uniform from the old works. The winze on the 900 level is down 12 feet; in hard quartz, with very little water. The receipts of bullion for December account foot up $13,739.

Hale & Norcross — dropped from $83 to $46 50, and closed at $46. It is believed that the lower drift is not far enough west, according to survey, to strike the body of ore which they had on the third station. Some think they have passed through the ledge. A telegram of the 24th says they have gone seven feet further in quartz, and have met another seam of clay, but no body of water has yet been encountered.

Crown Point—improved from $50 to $54, then sold at $52 50, and closed at $52 75. The south drift from the 900 level is in from the Kentuck line, and proves to be barren. The shaft is down 1,075 feet from the surface, continuing in very hard rock, which is supposed to be the "west country." The stopes on the 850 level are said to be looking moderately well, showing an average width of from four to six feet.

Kentuck—advanced from $250 to $272 50, declined to $246, and closed at $245. The receipts of bullion for December account to the 21st inst. foot up $23,825 47.....Gold Hill Quartz was in the market at $75 seller 30. Bullion on December account, $7,060 47.....

Confidence sold at $40@37. Receipts on December account, $6,958 14.....Eureka (Cal.) is quotable at $210. The bullion returns to date for December account aggregate $49,002 62.

Amador (Cal.)—realized $241@250, and closed at $245. The expenses will be greatly reduced for the present month, amounting to only about $17,000, whereas for the past three months they have been from $28,000 to $30,000 per month. This is a favorable showing for increased dividends.

Chollar-Potosi — opened at $168, declined to $148, and closed at $145. For the week ending December 18th 1,264 tons of ore were extracted. The ore shows some improvement. The pumps were started on the 14th to relieve the new works from the accumulated water, which was speedily reduced....Overman—sold to a considerable extent, ranging from $81 to $90, then at $84, and closing at $84 50. On the 21st inst. $22,149 55 in bullion was sent forward to the office in this city.

Belcher—was in the market at $175@173. The annual meeting of the stockholders of the Belcher Company was held in Gold Hill on the 21st inst., and the following gentlemen elected officers for the ensuing year: P. N. McKay, Lewis Reynolds, Duncan C. McKay, William H. Blauvelt and A. M. Edgington. At a subsequent meeting of the Trustees, P. N. McKay was chosen President: H. Bruckmann, Secretary; William Sharon, Treasurer, and P. N. McKay, Superintendent, vice James N. Parks, resigned. We understand that it was resolved to move the office of the company at once to San Francisco.

Lady Bryan — ruled at $20 50@16. In the suit pending between the old and new claimants to the mine, the Supreme Court, on Wednesday last, rendered a decision confirming the title of the latter. The value of the discovery made in the old winze is not yet known, but it is well known that a considerable quantity of very rich ore was taken from the winze some years ago. The old company abandoned the winze (probably for speculative purposes) and concealed the entrance thereto; the new owners discovered it some time since, in the tunnel, but not wishing to prejudice the suit in Court (against them), kept silent. Important developments may be expected in the mine at no distant day.

Savage — sold to a large extent, opening at $82 50@84 50, declining to $74, and closing at $76.....Golden Rule (Cal.) pays its usual bi-monthly dividend.....Mohawk (Cal.) levied an assessment of $3 per share on the 7th inst.

Yellow Jacket—was quite active, advancing from $1,265 to $1,375, declining to $1,310, and closing at $1,320. This company "will declare another $300 dividend about the 1st of January, which will probably be the last previous to the contemplated increase of the capital stock. The north drift, 800-feet level, which is being pushed for the old works, is a sealed book. The 'blower' was turned loose in this drift a few days since, and found to be too strong, in consequence of which the aerial conduit was shortened fifty feet. Developments in the 900-feet level continue most flattering. Since the water was pumped out of that level cross-cuts north and south from the east drift have been commenced some distance shaftward of the end of the drift. The south cut is in ore of the richest character, the face being in the same body which was cut by the east drift some time since, which holds well some distance south of the drift—and in fact shows no signs of exhaustion. The north cross-cut is also in good ore, and the formation of that portion of the mine lying along the entire length of the east drift appears to be a vast mass of quartz."

Almost every day we hear of many persons complaining of headache, loss of appetite, and that they are not fit to do anything, etc. Many is the day that we have felt so ourselves, and in fact have gone to bed and imagined ourselves sick, but for the life of us could not tell what was the matter. One day, while thus complaining, a friend said to us, "why don't you try Plantation Bitters? They are really a good thing, and will make you feel like a new man." Upon his recommendation we purchased a bottle, and took them according to the directions. They seemed to go right to the spot, and gave us immediate relief. Ever since we have taken every opportunity to recommend them.

Opera Glasses, Telescopes, Magic Lanterns, Drawing Instruments, Microscopes, etc., at $5 each. C. Muller, 205 Montgomery street, Russ Block.

Advance Terms.—The terms of subscription of the Mining and Scientific Press are in advance—the same as most first-class journals in the country strictly adhere to. No subscriber should consider the stopping of a paper at any time, when it is not paid for, as a personal slight.

We Consider the Mining and Scientific Press the most valuable mining and mechanical newspaper issued in the United States. Dewey & Co., publishers, are also solicitors of foreign and American patents and conduct patent cases of every kind. We guarantee that all business confided to them will be carefully attended to, and we further believe that every miner, mechanic, and scientific man should have their valuable paper.—*Auburn Stars and Stripes.*

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, Dec. 12th: Owing to the incapacity of the roasting facilities at the Pioneer mill, the Star Co. are making slow progress in working their ores; about a ton a day being the extent of present capacity. What they do run through, both of first and second class ores, proves each day more conclusively, that chlornation is the best system of reduction that could be adopted for them. Judge Culver has gone below to procure the necessary materials for a winter's run.

Amador County.

Jackson *Ledger*, Dec. 19th: Hall McAllister, owner of the Summit mine at Sutter Creek, has bought the two claims south of him, and consolidated them with the Summit, thus giving him 1,800 ft. of as rich quartz ground as can be found in Amador County.

The new hoisting works erected at the Auaconda mine will be put in operation this week.

Mr. Walther showed us on Wednesday last, some very handsome rock taken from the Trowbridge mine. It was completely studded with glittering sulphuret, and had every appearance of the rich quartz taken from the Coney & Bigelow mine. The company are now down 100 ft., and will, in a few days, commence sinking again.

The owners of the Coney & Bigelow mine have decided to sink a new shaft on their ledge. It is to be located 200 ft. south of the present one, and will be 10 ft. square in the clear. Work on it will be commenced the 1st of January.

Calaveras County.

Mokelumne Hill *Chronicle*, Dec. 19th: We are informed that a couple of ladies, residents at Railroad Flat, while out walking one day last week, picked up some pieces of rock which were extremely rich—sparkling with gold. Subsequent research has developed an extensive lead of quartz which eclipses everything yet discovered in that vicinity. Railroad Flat is one of the most promising mining camps in the county and constantly improving.

It has rained sufficiently to set every miner capable of "slinging" a pick at work.

The Whisky Slide correspondent writes: There is considerable work being done along Chili Gulch; the first place I stopped at was the Quaker City mill, situated on Hog's Eye Gulch. Things look rather "slummy" around here at present, for which they are indebted to the knowing one who had charge of the shaft, and allowed the water to rise some 80 ft., causing a large cave. The last rock taken from the shaft looks well, and I have no doubt but that perseverance and a deeper shaft will develop a good mine. The next claim I visited was the Coffee mill. This is a gravel claim, situated at the head of Skunk Gulch; this is said to be one of the best paying mines in the locality; the dirt is taken from the mine through an incline tunnel, in cars, to a dump, where it is crushed by six stamps, propelled by means of steam power. Farther down the gulch several new companies are opening mines, but the work upon them is not sufficiently advanced to determine their value. On my way home I visited Jesus Maria. Mining is dull here at present, on account of the scarcity of water. At Whisky Slide the miners are all waiting for water. They have their flumes set and their picks sharpened, ready to take advantage of the first shower.

Markleeville *Miner*; Dec. 12th: At a mine near Angels, in Calaveras County, the Hagan Water-burning Co. is now putting up a kiln, to expel the sulphur and other impurities from the ore, so that all the gold will be got out afterwards by ordinary milling, and there will be no sulphurets to save and work over by the usual expensive process. It is claimed to be the only kiln in which heat can penetrate the ore (of battery size) so as to reach the inmost sulphur and draw it out. It is also claimed that steam injected into a kiln heated at first by a small amount of wood is decomposed, and its hydrogen is separated and made available for fuel instead of wood, to a great extent.

Los Angeles County.

Los Angeles *Republican*, Dec. 12th: The prospects of the Soledad mining district brighten from day to day, and in no instance has a ledge failed to improve as depth was gained. All parties interested are sanguine of success, and every day the number of prospectors increases, as, different from the northern mines, the winter is here the best time to prospect, there being no snow or severe weather. There are about an equal number of natives and Americans prospecting, the Americans principally from Santa Barbara and San Buenaventura, where these mines are causing a little excitement. Dr. Colombo, a noted prospector, has lately arrived in the district and feels sanguine that he has found here something worthy of attention. Searles & Yates expect their 5-stamp mill down on the next steamer. They have sold a one-sixth interest to advantage.

Polk & Kabler are working their 5-stamp on ore from the Saratoga lode, and expect to have five more stamps working within 30 days. Clark & Gleason have started a large working shaft eight by four in the clear, and intend erecting a 10-stamp mill if the lead looks favorable at 100 ft. deep. A number of new ledges located, though not prospecting rich, yet warrant work, and parties prospecting them find the quality of ore improving. Some Mexicans have found a fine lead of galena of liberal dimensions, about 20 miles from the gold mine. It has a large percentage of silver, and is attracting the attention of men posted in silver mines.

Mariposa County.

Mail, Dec. 18th: The Mariposa Co. have purchased one of the Thunderbolt crushers and pulverizers, which is now upon the ground at the Benton mills, soon to be erected and attached to one of the mills, and will, no doubt, be of great importance to those interested in quartz mining in this State. It is a late improvement. It is said that it will crush, pulverize, and reduce to an impalpable powder, from 30 to 50 tons of ore per day, and is of very durable constitution—every part being made adequate to the strain brought to bear upon it. The jaw-plates will admit boulders of over 50 lbs., and can be graduated as occasion may require.

Nevada County.

Transcript, Dec. 17th: The Little York Water and Mining Co., after purchasing the Garduer property, consisting of mining claims, water ditches, etc., bought out Findley & Co., thus consolidating under one company nearly all the mining property on the ridge. Since the 1st of July they have been busily engaged in getting the claims in order for extensive work, and are now running three pipes with 300 ft. pressure. Since they purchased, they have taken out in the neighborhood of $14,000, and when water comes, they expect to have ten pipes at work on their banks. For the past five months they have employed from 30 to 50 men, constantly, and expended about $1,000 per week cleaning out and fitting up ditches, building dams, flumes, etc., and they have now ready, ditches that will carry 3,000 inches of water. The three pipes pay $200 per day, and they have ground enough to last twenty years. Little York Ridge, with a favorable season, will yield an immense amount of gold.

Gazette, Dec. 16th: Last Saturday morning, Hans Robert picked up a lump of gold in his diggings, near Rough and Ready, weighing eight ounces.

Dahle & Co., of Rough and Ready, are erecting a quartz mill on the Bunker Hill ledge, at that place.

Dec. 18th: The following items are from Boston Ravine: Ben. McCauley cleaned up on Wednesday a crushing of 100 loads of rock from the Rocky Bar mine, on the Chevan ground, which yielded nearly $25 per ton. Frank Morse, who has a lease of the Larrimer and Higgins ledge and mill, is prosecuting work with energy, putting the mill in perfect repair and taking out some of the finest average rock in that vicinity, yielding about $50 per ton.

Dec. 19th: This paper gives us a long account of a region of country laying between the camp of Eureka, on the Henness Pass road, and the mouth of Cañon Creek, called "God's Country," a very expressive name for so wild a country. It says: In places where the cañon is the narrowest, a man standing on the ridge above could easily throw a stone to the bottom, a distance of 1,500 or 2,000 feet. Numerous large gold-bearing quartz ledges have been found in the wildest part of this region, but the difficulty of access to them with machinery has thus far been a serious obstacle to their development. The Star mill and mines are located on the steep sides of the mountain or cliff, about 1,500 ft. above Cañon Creek. All access to these mines by teams is by the way of Eureka and the Henness Pass road. A road has been projected and surveyed from Washington, up the Yuba and Cañon Creek, by the way of the Star mill to connect with the Henness Pass road, but the rocky nature of the best route that could be found, has thus far prevented its construction. At the head waters of Little Cañon Creek, and the North and South Forks of Poorman's Creek, the country is a sort of table land, and easy of access. It is in this vicinity that some of the best quartz mines in Eureka township have been opened. This region can be reached with so little difficulty that it is not included in what is termed "God's Country." This latter is confined to the slope drained by the lower portion of Cañon Creek, and covers a district of four or five miles square. From personal observations, and the testimony of a number of miners who have prospected in this isolated wilderness of rocks and deep sunken gorges, we believe for mineral deposits it is not surpassed by any other part of Nevada County. Its ledges of quartz, cropping out boldly from the steep sides of the cliffs and ridges, nearly all bear traces of gold, and some of them pay well from prospecting in a hand mortar.

The Eureka mine is now being worked in levels Nos. 2, 4 and 5, the 5th having just been opened, and the ledge at this point will average about 3½ feet in width, and in depth is 563 feet perpendicular from the surface. The amount of rock taken from the mine during the present year is 18,000 tons. Rock now on surface is 1,000 tons; below, mined out and ready for hoisting, 2,000 tons. The average monthly expenses of the mine is $18,000. One per cent. of all the rock crushed is saved in sulphurets, and the latter worked by the chlorine process in the company's works at the mine. The sulphurets for the past year have yielded on an average $200 per ton. They are saved in the Paine & Steven's buddle. The last 12 days' run have yielded $25,200 outside of the battery and sulphurets.

The new 15-stamp mill at the Idaho mine is constantly employed on rock taken from the mine, and is crushing on an average 150 tons per week. They have a surplus of 700 tons of rock on the surface. The Idaho is now being worked at a perpendicular depth of 420 feet. The ledge at this point is from 4 to 4½ feet wide. Gold is saved from the blankets, the pulp ground in the amalgamating pans, and the sulphurets saved by the Paine & Steven's buddle.

Grass Valley *Union*, Dec. 15th: Hank Roberts and Jas. McCauley, in working some new ground on Bunker Hill, near Rough and Ready, on Friday last, took out a nugget weighing eight eight ounces and a half, and worth $153.

Plumas County.

Quincy *National*, Dec. 12th: Thompson & Percival have sold their interests in the Barker claims, on Mill Creek, to some parties from Poorman's Creek.

A correspondent gives the following items from Greenville and vicinity: Blood & Co., of the Indian Valley mine, contemplate starting up the Pennsylvania mill in a short time. They have struck some excellent rock in the last extension of the lower tunnel. They are crushing rock taken from that point this week, and the plates make a splendid showing....Cherokee looks quite lively now. Judkins & Kellogg are putting up hoisting machinery on their mine. They have erected a large building, sufficient to cover their hoisting works, as well as to afford room for all the timbers and shop necessary to carry on their mine. The Caledonia mill is also in operation, though I do not think it is paying as well as its owners would like to have it....I paid a visit to the north arm of the valley a few days ago. The Enterprise mill in Light's Cañon, will commence operations in a short time. It is said their rock will assay $120 per ton.

The Butte *Record* says: A lump of gold weighing $999, was recently brought into the banking-house of Rideout, Smith & Co., of this place. It was about the size and shape of a griddle cake, with two or three small pieces of quartz attached to one side. It was found at the mouth of French Creek, at or near Rich Bar, Plumas County.

Trinity County.

Weaverville *Journal*, Dec. 19th: The late storm has raised Cañon Creek sufficiently to fill all the ditches taking water from it. The miners along the line of McGillivray's new ditch can resume labor next week, and we look for some rich returns from that section next season. The ditch will be finished to the terminal point before long, where new, and it is believed rich diggings will be opened.

Tuolumne County.

Sonora *Democrat*, Dec. 19th: The Tuolumne Water Co. have shut off the water from their ditches. The supply in the reservoirs is almost exhausted and, besides, some repairs have to be made on ditches and flumes. This will throw the miners of Columbia, Saw Mill Flat, Shaw's Flat, out of work for a few weeks.

The Phœnix Water Co. has a good supply yet; and in the diggings covered by their ditches the miners will be able to work on without interruption.

Yuba County.

Marysville *Appeal*, Dec. 18th: We understand that the Pennsylvania Co. is taking up from the plates about 40 ozs. of amalgam for every 24 hours crushing.

COLORADO.

Georgetown *Miner*, Nov. 26th: The work of setting up the new roasting cylinder at the works of Hunepedeu, Wolters & Co., is progressing rapidly, and in a short time will be ready for use....Hunepeden, Wolters & Co. have taken out and shipped since our last report, 2,106.95 ozs. of silver bullion, coin value, $2,265.68....At the Terrible shaft-house, the other day, we saw a beautiful piece of ore, weighing 268 pounds, taken from the east stope. It measures 11½ in. in width, and is solid mineral....Mr. Carpenter, of Mill City, has found a fine silver lode in Montana district, near Silver Creek, which carries from $200 to $700 in silver to the ton of ore.....The Supt. of the Brown Co. shipped to his company East, on Friday last, 206 pounds troy of silver bullion, coin value, $3,336.20.

Mr. Teats, of the California Reduction Works, informs us that he is now working the richest ore he has ever seen in Colorado. One of Dr. Blatchley's pans is in constant and successful operation, working mostly on surface ores, from which he gets an average of 80 per cent. of the assay value. On some lots he has done much better than that. We are told that one lot from the Mahaska lode, which assayed $50 per ton, yielded in the pan a little over 45, or more than 90 per cent. of the assay value.

Central City *Register*, Nov. 26th: Geo. E. Randolph is reconstructing the Ophir mill, with a view to improving its beauty, and arranging for greater convenience.

Mr. Burlingame, Territorial Assayer, has shown us two beautiful specimens of silver ore, one face of which was thickly dotted over with "snarls" of native silver in fine wires. The same specimen also contained a considerable quantity of what appears to be chloride of silver. The other was a large and beautiful specimen, of a different character, containing galena, zinc-blende, iron pyrites, etc., and the whole dotted over with spots of green and blue carbonate of copper, and is apparently quite rich. A large amount of very rich ore is now being taken from the mines in this locality.

A lot of 2,100 pounds of ore from the Pittsburg and Boston lode, Dailey district, was recently run by Mr. Stewart, at Georgetown, which yielded 125 ozs. of silver, .955 fine. Light & Co. are still at work in the district, developing the Mountain Ram lode. Considerable activity is anticipated in that locality for next season.

Last evening we saw at the Territorial Assay office, a beautiful button of silver, 1 oz. 6 pwts., taken from 1 oz. 17 pwts. 13 grs. of ore from the Conley lode, situated in Silver Gulch. This indicated a yield of $26,127.40 per ton of 2,000 pounds.

Charles Hill, recently from Granite district, reports mining affairs there as hearing quite a favorable aspect. The veins, which were almost universally very narrow and rich at the surface, have very generally grown wider as sinking progressed on them, without any diminution in their richness. Several stamp mills are in operation in the district, and are generally obtaining very encouraging results. He predicts quite lively times in that section for next season.

DACOTAH.

Sweetwater *Mines*, Dec. 5th: Anthony & Coufroth have purchased the remaining 600 feet of the Miner's Delight ledge, owned by Gallagher, Pugh & Chase, for $18,000, and Mr. Anthony intends to put a 10-stamp mill upon it as soon as possible. Mr. Anthony will ship his mills from Benton, soon.

Messrs. Smith & Dalton, who recently sold 800 feet in the Austin City ledge for $40,000, left yesterday for Chicago, taking with them a large quantity of quartz specimens, which would do credit to any country in the world.

IDAHO.

Owyhee *Avalanche*, Dec. 12th: Wessels & Co. located two lodes in South Mountain district, one called the Original, and the other the Galena; the former averages from 20 to 30 feet in width, and contains silver, gold and lead—silver predominating. There is a shaft sunk on the lode a depth of six feet. The surface rock, or croppings, assayed 21.98 per ton; at the bottom of the shaft the ore assays $105.55 per ton. The Galena is a smaller lode than the Original, but according to the assay returns, far richer. This lode, at a depth of two feet from the surface, is four feet in width, and the ore assays $248.15 per ton. Like that of the Original, it contains silver, gold and lead—silver predominating. Work will be steadily prosecuted thereon until they are fully developed.

The quality of ore coming out of the Ida Elmore mine, is as rich as ever, and is be-

ing taken out fast enough to keep the mill pounding day and night.

The Flint correspondent writes: The Rising Star mine is being worked extensively; the shaft is down a considerable depth, and the lower level exhibits a lode from six to ten feet in width, extremely rich. The company's 40-stamp mill will be in operation by the 20th inst.

Work on the Forrest ledge is being pushed rapidly; the shaft has been sunk 150 feet, and a tunnel is being run to tap it; the ledge is well defined, and rich ore is being taken out at the bottom of the shaft. Black's mill has been leased by this company, and will commence crushing in a few days.

Considerable work is being done on the U. S. Grant and Twilight, both show good mineral.

A correspondent at Warren's, writing to the Walla Walla *Statesman*, under date of Nov. 16th, reports the product of eight tons of the Scott ledge ore, crushed at Williams & Maxwell's Pioneer mill, to be $1,206.87, or over $150 per ton.

MONTANA.

Helena *Post*, Dec. 14th: Sterling is improving wonderfully in prospects. Capt. Maltby is running the quartz mill belonging to the N. Y. & M. M. D. Co. mill steady, with very satisfactory results. Other mining operations are in contemplation and are being undertaken, which will materially add to the prosperity of this district.

In the upper part of Dry Gulch Col. Nelson upon sinking a shaft 75 ft. struck a shelly bedrock upon which was found coarse gold and good pay. Some distance below, where the gulch is wider, all attempts to find gold have proved unavailing, from the fact that a secondary bedrock was struck, some 25 ft. below the surface. It is supposed that this bedrock is a slide, and acting upon this suggestion, Col. Nelson proposes to sink a shaft till he strikes the same character of bedrock.

Cayuse Gulch, one of the tributaries of Ophir Gulch is situated four miles above Blackfoot. The discovery of gold was made in it last summer, but the ground was not fairly opened until October last when David Johns and party obtained $1,000 from a space 15 by 20 ft. in area. The gold found was very coarse and heavy, one nugget weighing $81 and three or four others weighing from $35 to $40 being secured. This gulch is supposed to be the main source of gold, supplied to Ophir Gulch, and those interested in it are sanguine of rich results next season. Twenty-one claims have been staked, but not over a third of them have yet been worked, the supply of water being scarce. It is thought that these mines will supply about 40 men next summer, as it is proposed to flume the ground. The pay streak is about 30 ft. wide and 12 ft. deep.

NEVADA.

Humboldt.

Unionville *Register*, Dec. 12th: H. H. McColly gives the following information concerning the placer mines on Willow Creek:

Gold is found for a distance of about 14 miles along the banks of Willow Creek, which in many places are wide, affording large deposits of auriferous gravel and earthy deposits. The creek is quite a large mountain stream which will afford an abundance of water for sluicing the banks and gravel deposits adjacent thereto. Mr. McColly says, from the tests which he has made, he is satisfied he can make at least $10 to the hand in sluicing his claims, but it is almost impossible to get lumber at this time for sluice boxes and other purposes. Pieces of gold have been taken out weighing as high as 75 cents. The number of miners at the new camp is now about 20, but quite a lively mining camp is expected to grow up in the spring.

We were shown some very rich samples of ore this week from the Alpha mine, in Panther Cañon. From Mr. Stuart, who brought the ore, we learn that there is a large quantity of the same quality in sight, and that the lode is at least 12 ft. in thickness at the point where they are now at work upon it.

Work is to be resumed on the Auld Lang Syne mine in Dun Glen Cañon. It is the intention of the owners to take out and have worked at the Empire mill a considerable quantity of the ore, in order to test its quality.

All three mills in Buena Vista Cañon are now running up to their full capacity day and night, on ore from the Manitowoc and Arizona ledges, which promise to yield an abundant supply for an indefinite period.

Arrangements are being made to have a quantity of ore from the Bullion mine in Sacramento district taken out and worked at the Unionville mills. It is contemplated by this company to resume work on their mine at an early day.....S. D. R.

Stewart, Supt. of the Silver Mining Co., made his first shipment of silver bullion on last Wednesday, 678 ozs., valued at $960. This was from his run on the first 20 tons of ore ...The Pacific Union Express Co. shipped from its office in Winnemucca, on Tuesday last, 1,754½ ozs. of silver bullion, received from Golconda ...Fall & Co. shipped this week, per Wells, Fargo & Co's Express, 3,000 ozs. of fine bullion.

The Little Giant Co. forwarded to San Francisco this week, by the Pacific Union Express Co., 610 lbs. of bullion, worth about $11,000, which is the product of 40 tons of ore. The total shipment of bullion from this mine for the month ending Dec. 10th, is $18,600. It is the intention of the company to close down for awhile, as they cannot work to advantage during the cold season without shelter, which they cannot procure this fall. The company will, however, continue to draw ore to the mill, and be prepared to do extensive work as soon as the mill is covered in. The mine is looking as well, if not better than ever.

Dunn & Higgins are taking ore out of the St. Helena and Talisman, in hopes that they will be able to get it worked when the mill starts again.

Reese River.

Virginia *Enterprise*, Dec. 17th: The rush to White Pine from this city and vicinity still continues. Wells, Fargo & Co. are now sending out from their office in this city eight passengers every other day, this being the greatest number they can venture to forward from here, on account of the many White Pine and overland travelers passing east from California. Few passengers are now being booked, as the number booked ahead is already quite large. Besides those going by stage a great many are daily leaving this part of the State for the new mines, on horseback and in vehicles of all kinds. As long as the present fair and mild weather continues the rush to the new mines will last.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Dec. 17th: The return of bullion from ore worked in Birdsall & Co's mill, for the past 12 days of the present month, was 450 lbs., of the assayed value of $12,241, the mill being run only to three-fourths of its capacity (90 tons per day.) The ore is of very uniform quality, and is now being extracted from the upper level. The new tunnel, which will probably be completed by April, taps the ledge 400 ft. lower than the present level. Over 100 ft. of the ledge has been prospected by means of an incline and found to improve, with a thickness of 10 ft. of good pay ore.

Dec. 19th: The Imperial-Empire shaft has cut into the clay of the east wall of the Comstock. They did not expect so soon to strike the wall, but it seems that the dip is less than was estimated.

There was shipped from this city by express during the past week 5,533 lbs. of assayed bullion, valued at $202,127.52.

OREGON.

Portland *Oregonian*, Dec. 12th: We learn that rock containing—as is supposed—silver, has been recently discovered on the Colima, six miles above Monticello. When tested in a forge, the rock furnished a substance which galvanized iron, as is usual with silver-bearing rock. Some of the rock has been left with Lloyd Brooke, of this city.

Walla Walla *Statesman*, Nov. 14th: The new mines discovered on Perry Creek late in the fall, so far as prospected and worked, prove to be very rich and extensive. Mr. Bartlett, who returned from the new camp on Thursday last, reports eight claims opened, two of which pay over $100 per day to the hand. Mr. McCauley, an old Carrihoo miner, is working with sluices and employing some five or six men, averaging, so far, $90 to the hand; he is also running a shaft into the hill opposite his claims, and on the day that Bartlett left, had struck paying dirt, with very handsome coarse gold. Provisions are not over plenty in the camp; what there is is selling at very high rates. About 75 men will winter in the camp. A large number of miners from Montana have secured claims; they will return in the spring to work them. Mr. B. says that a regular stampede is expected from Montana early in the spring. The Hudson Bay Co. have a store already in the camp, and until the trains from Walla Walla arrived, did a good business, and sold goods at enormous prices. Flour was sold as high as 50 cents per pound, and other goods in proportion. They received over $1,200 from the sale of five kegs of liquor.

Jacksonville *Sentinel*, Dec. 12th: The Enterprise quartz mill in Josephine County, lately sold by the sheriff, has been purchased by G. Karusky for the sum of $876.

Nitrates in Nevada.

The commercial value of mineral nitrates being duly appreciated by both shipping and manufacturing interests, since Chilian nitrate of soda has been brought to use in supplying the world with nitric acid and gunpowder, more or less notice has been taken also of the occurrence of nitrates in the interior of Nevada. Regarding a locality on the road to Belmont, Nevada, (12 miles south of Austin,) a racy correspondent from "a cool cave" in that vicinity, noted for its nitrogeneous contents, furnishes the following acceptable information:

The Toyabe Range is here composed entirely of metamorphic rock, with which several basalt and porphyry eruptions have played particular ——. Now and then only, traces of some kind of coral are found in the dolomite or limestone, as it is here called. The mountain is cut almost to its base by fearful precipitous cañons, and wherever the rock is limestone, caves and caverns of all possible shapes and sizes are found. Some are quite large, and extend for several hundred feet into mountains. The limestone is crossed by innumerable seams and cracks in every direction, and myriads of mice, gophers, etc., live in these, and their excrement, vulgo dung, fills every crevice and cave. Now, mark you, I "guess" there is where the nitric acid comes from.

The limestone, wherever caves occur, is massive crystalline, and shows no sign of regular "slating;" but besides these fissures, noticed as sylphine retreats of rats and mice with deposits of dung, the limestone is crossed by numerous fissures and cracks that are filled with a fine white crystalline mass, sometimes tinged slightly yellow; and also fissures filled with calcspar, as is usual in limestone of this description. The general color of the limestone, so-called, (better dolomite,) is blue.

Take the above mentioned fine white crystalline filling of a certain kind of cracks, and put it into water, and it will dissolve easily. From it you can crystallize the following minerals, or products:

$CaONO^5$	(chiefly) say	70 per cent.
$NaONO^5$	"	20 per cent.
$CaNO^5$	"	5 per cent.

NaCl and other substances 5 per cent.

Other specimens have contained as high as 50 per cent. of water, but the proportion of solid matter remained about as above. For description of taste, etc., see some good mineralogy.

Two "flourishing" towns have been laid out, and are supposed to live upon the above valuable mineral deposits; but I have my doubts. There certainly are some magnificent domicils, (log huts) and I also noticed some copper-colored specimens of the genus homo. My friend persisted in attributing the copper color to the influence of the nitrates. However this may be, I think the inhabitants depend for their subsistence more upon lizards, rats and mice, than upon the commercial "leach products" of the excrement of said fauna. The adjective "flourishing," above given to the town, relates properly to the luxurious serenity and aboriginality within the town limits, of that glorious species of artemesia, known as "sage-brush."

Still, these mines may become valuable in some future emergency; for instance, in case of a war with England, (vide *Herald*, etc.) for there certainly is more than a bushel of this valuable product of our glorious country, in this district alone!

The renowned croppings, or as they have it here, "indications of croppings" of petroleum, also occur in this district far-famed and valuable. In my opinion, they are merely weak decoctions of rats——the watery portions having evaporated, leaving a bitter, pitchy mass, which burns and stinks like all possessed.

Resinous deposits of similar origin are found in a cave at Lake Tahoe, and doubtless at many other localities, where a natural process of manufacturing nitrates may result, even to a considerable extent.

Nitrate of potash ($NaONO^5$) or saltpetre, tastes saline and cooling, being soluble in water; is a degree softer than limestone, colorless, and is found generally in minute needle-form crystals, and crusts on the surface of the earth, on walls, rocks, etc. It forms abundantly in certain soils in Spain, Egypt and Persia, especially during hot weather succeeding rains. It is also manufactured from soils where other nitrates (nitrate of lime or soda) form in a similar manner, and beds called *nitriaries* are arranged for this purpose in France, Germany, Sweden, Hungary, and other countries. Refuse animal matter, putrified in calcareous soils, gives rise to the nitrate of lime. Old plaster, lixiviated, affords about 5 per cent of nitre. In India it is obtained in large quantities for the arts. In Madison County, Kentucky, it is found scattered through the loose earth, covering the bottom of a large cave.

Nitrate of soda ($NaONO^5$) or nitratine, occurs in efflorescences, also massive, and granular; on soda plains. In the district of Tarapaca, northern Chili, where the dry pampa for 40 leagues, at a hight of 3,300 feet above the sea, is covered with beds of this salt several feet in thickness, along with gypsum, common salt, glauber salt, and remains of recent shells, the last indicating the former presence of the sea.

It has likewise a cooling taste, and is sometimes of a reddish brown, gray, and lemonade yellow, is softer than sulphate, transparent, and the crystals are double refracting, like Iceland spar. Saltpetre and nitratine both deflagrate, or puff up, like weak powder when thrown on burning charcoal, which is the easiest and surest method of distinguishing nitrates.

Animal substances of all kinds contain much nitrogen. Volcanic gases have been found charged with it; they were probably the source of the Chilian deposits.

Projects to Open up Southern Nevada. The interior railroad scheme in which Austin and the Idaho people are specially interested, brings Southeastern Nevada prominently into notice; a country which is represented on Colton's map of 1865 by a topographical blank, and described by a note, in large italics, to the effect that "This vast unexplored region of country, is supposed to be inhabited by tribes of Indians; altitude nearly 5,000 feet." The railroad in question will connect the Central and Southern Pacific Railroads, and bring Eastern Nevada into close connection with some good agricultural country where flowers seldom droop from the touch of frost. Starting from the Colorado and following up the Rio Virgen river from Callville to the mouth of Beaverdam Creek, a distance of eighty miles, is a valley from three to nine miles in width, of as productive land as that of San Bernardino valley, with the high dividing ridge between the Virgen and Colorado on the east covered with the finest timber, while to the west table land rises with a gentle ascent back to the Wasatch Mountains, a distance, in some places, of thirty miles. This bench has numerous streams crossing it from the mountain cañons, and is covered with the richest grass, but no timber. The Muddy, a stream which rises from hot springs in the mountains about twenty-five miles west of the point where the Beaverdam joins the Rio Virgen, also flows through a broad and beautiful valley. The Pinte Indians, under the guidance of Mormon missionaries, have been farming in this valley for years, and the yield of wheat, corn, potatoes, etc., is astonishingly large. The water of this stream remains warm until it pours into the Rio Virgen.

Forty miles to the southwest along this table land, brings one to Las Vegas, the trellised conduit of myriad cool springs and a few warm ones. Here, mesquit and wild grape vines cover the valley proper, while the table land is dotted with clumps of cottonwood, willows and wild flowers—indicating the points where water bubbles up. The vines in the valley bear grapes of the largest and most luscious kind, and have the appearance of having descended from the Spanish or English grape. The head of this valley is about forty miles from Callville, and at the summit of the low range of hills which separates it from a sagebrush desert to the west, is an extensive deposit of lead, which is perhaps nearer pure than has ever been found elsewhere. The mountains in this region are of granite formation, with here and there ledges of yellow marble, similar to that found near Cedar City, in Utah.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

W. B. EWER. A. T. DEWEY.

DEWEY & CO., Publishers.

OFFICE—No. 414 Clay street, between Sansome and Battery.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Traveling Agents.

A. B. BUTLER, California, agent and correspondent.
WM. H. MURRAY, California.
DR. L. G. YATES, California.
S. H. HERRING, California and Nevada.
T. G. ANDERSON, Nevada.

Resident Agents.

HELENA, Montana.—R. F. May.
BLACK HAWK, C. T.—Harper M. Orahood.
CENTRAL CITY, C. T.—Messrs. Richards & Crane, of the City Book Store, Main street, will act as our agents.
GEORGETOWN, C. T.—John A. Lafferty, Postmaster, is our agent in this place.
DENVER CITY, C. T.—Messrs. Woolworth & Moffat, are our agents for this place.
CHEYENNE, D. T.—Mr. Robert Beers is our authorized agent for this place.
OMAHA, N. T.—Messrs. Barkalow & Brothers, are our agents for this place.
A. S. Hopkins, No. 70 J street, Sacramento.
MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868

San Francisco:
Saturday Morning, Dec. 26, 1868.

Notices to Correspondents.

CRUCIS.—VACCINATION was first practiced in England by Dr. Jenner, who, for its introduction, received a grant from the British Parliament of $50,000. Prior to that period (1796), innoculation was employed as a preventive of the small pox. Jenner's improved mode consisted in employing the lymph obtained from a cow that had been attacked by the small pox; hence the word vaccination. Dr. Jenner was first induced to pay attention to the subject now termed vaccination from observing the fact that the Gloncestershire milkmaids, after undergoing a mild form of the disease, contracted by milking cows attacked with variola, were never found to be attacked afterwards by small pox. On this fact he conceived the idea of artificially inducing the disease in the milder form, by what is now known as vaccination, and had sufficient influence with his Gloucestershire friends to have the operation performed in cases sufficiently numerous to incontrovertibly establish the principle. In a few years afterwards, innoculation, or the impregnation of human beings with virus from persons suffering from small pox, was prohibited in England, as it was found that innoculation was not a sure preventive from future attacks, and was sometimes—and that not nnfrequently—followed by death. If once properly performed with good vaccine lymph, vaccination is esteemed by all eminent French and English physicians as a certain preventive from attack at any future period of life. The seven years' lease from impunity from future attack set up by some of onr medical men in San Francisco would be laughed at by their brethren in France and England. Such a theory, however, comes appropriately from a medical meeting that could tamely listen to a long disputation about the employment of syringes and other complex instruments as being the mode best adapted to introduce the vaccine matter into the human system. From the fact just stated, it may be accepted that the major part of the medical men, at the meeting named, were thoroughly unacquainted with, and must have never practiced, vaccination, or ever seen it properly performed. Every medical man's case of instrnments in England is furnished with a fine-pointed, needle-shaped piece of steel, but in its absence the punctures and the insertion of the lymph may be equally well performed by a slender stocking darning-needle. If good lymph is employed, one puncture generally suffices, and three are rarely or never found to fail.

OBSERVANT.—One of the oldest and simplest modes of detecting one of the phenomena connected with earthquakes, is to have a common earthen basin partially filled with some viscid fluid, such as molasses, which, on being thrown by oscillation up the side of the bowl, shall leave a trace of the outline of its surface. This mode, however, can only afford a rude approximation to the direction of the horizontal movement.

Standard Works on Metallurgy.

The best book on metallurgy to be had at present is undoubtedly the German work of Professor Bruno Kerl, late of the Hanoverian Mining Academy, in the cheerful little ancient mining town of Clausthal, in the Harz. Kerl is not uninformed regarding American mining developments, having had many American students, who have uniformly become much attached to him; so that when the Clausthal Academy partially broke up, about a year ago, those that there were there at the time followed him bodily to Berlin. The German edition is in five volumes, and is very complete, especially on the metals mined and "milled" in this country. Our miners and metallurgists will be interested to learn that a translation of Kerl's Metallurgy has already partially appeared in English, by William Crooks, F.R.S., and Ernest Rohrig; published by Longman, Green & Co. London, 1868. Part I is out, treating of lead, silver, zinc, cadmium, tin, mercury, antimony, bismith, nickel, gold, platinum and sulphur, being illustrated with 207 wood engravings; and Part II, completing the work, is promised speedily.

The admirably clear and concise style of Rivot's work on metallurgy—a single large volume, in French—makes it a favorite with many. Details of treatment are not so fully given as in Kerl, but Rivot has a happy faculty for presenting a picture of the actual operations to the mind of the reader.

Percy's work is the fullest and best on the subjects treated of by him—on fuel, fire-clays, copper, zinc and brass. It is doubtful whether Percy's proposed second volume, on lead, silver, gold, etc., will ever appear.

On amalgamatiou and California additions to the science and art of separating the precious metals from their ores, Kustel's work is the best and the only available publication. A very valuable old work is *Winkler's Amalgamations Processe*, describing very ably the amalgamatiou processes, both theoretically and practically, as they existed twenty-five years ago.

EARTHQUAKE SENSATIONS UNDERGROUND. The extraordinary fact discovered by the electric philosophers, that earthquakes are not felt at a little distance underground, or in the mines, proves to be not a fact, after all; unless the miners at the bottom of the Bullion shaft, 1,200 feet below the surface,—the deepest in the country,—were strangely misled by their perceptions on an occasion referred to by the Nevada papers. The men felt very much like coming up, and the foreman had to go down to reassure them. While he was in the drift at the bottom the second shock took place. He says it sounded as though everything in the mine was being pushed violently from the east to the west.

THE RETURNING U. S. SURVEYOR GENERAL of California, Lauren Upson, has not only added largely to his numerous list of friends on the coast, by an administration distinguished for its ability and integrity, no less than by the urbanity which has characterized the entire office nnder his charge, but he has received letters, we are pleased to notice, of special acknowledgement and appreciation from managers of the Land Office at Washington.

PACIFIC DEPARTMENT OF THE COAST SURVEY.—Prof. Geo. Davidson has assumed the superintendence of work belonging to this department. He has been in the serfor twenty-four years.

WE are indebted to V. S. Anderson, of the Idaho Council, for a copy of Gov. D. W. Ballard's Message to the Legislature of that Territory.

OUR traveling agent reports that the Union Express Co. is popular and doing a good business throughout the interior.

Educational Institutions of the Pacific Coast.

[Continued from page 388.]

Under this heading we noticed last week the Schools of Califoruia. We uow continue the following:

IN OREGON.

Willamette University, (Methodist) at Salem. Rev. Dr. Wythe, late President.

College at Portland, under the patronage of the Episcopal Church. (Started by Bishop Scott).

La Creole Academy, at Monmouth, Polk County.

Forest Grove University, at Forest Grove, Yamhill County.

Portland College, at Portland, (Methodist). Rev. T. M. Gatch, Principal.

Oregon Medical College, at Salem, Oregon. Horace Carpenter, Deau.

Corvalis College, at Corvalis. Rev. A. Finley, A. M., President; Joseph Emory, Professor of Mathematics, etc.

Catholic Institution, at Jacksouville, for females. There are several other educacational institutions, sustained by that church in Oregon.

IN MEXICO.

There is a first class University, inclnding a Mining Academy, in the city of Mexico. It was fully described in *Brownson's Review*, about twelve years ago, from which it appeared that the Mexican University stood on a levcl with the best institutions of the kind in the United States. Further and fresher data are given in *Baldwin's Gazetteer*. Recent political disturbances have almost or quite ruined many of the previously flourishiug educational institutions of Mexico; so that numbers of youug men are now being sent to this couutry to he educated. St. Ignatius College, of this city, and Oakland and Santa Clara colleges, are chiefly favored.

The educational institutions in the City of Mexico, are: 1. The *Universidad*, 2. The *Colegio de Mineria*, where mining and the natural sciences hearing thereon, are taught. This is a very respectable institution, having on its staff of professors, some able men. Castello, is the Professor of Miuing Geology. 3. The *Escuela de Medicina*. 4. The Colegio de Militar. 5. The Colegio de San Ildefonso, where languages, philosophy, law, civil and commercial, are taught. 6. The Colegio de San Juan de Letran. 7. The Colegio de San Gregorio. 8. The Seminarium. 9. The Colegio des Abogados, (legal). 10. The Colegio des Viscainas, (girls). 11. The Colegio des Escribanos, (notaries). 12. The Colegio de Belen, (girls). 13. The Colegio des Niños.

Local institutious are: iu GUADALAJARA, the *University*, where Letters, Philosophy, Law and Medicine are taught, and degrees conferred; the *Seminarium*, where Letters, Philosophy, and Law are taught; and the Institute of Law and Medicine, at San Juan. In MICHOACAN, the legal and clerical *Seminarium*, and the *Colegio de San Nicholas de Hidalgo*, located at the capital, Morelia; and several "colegios clerical," at Samora, etc. In Guanajnalo, the *Colegio de la Purissima*. In Leon, the *Colegio Seminario*, and the Colegio de San Felipe Neri. In San Miguel Allendi, the Colegio San Felipe Neri. At Acamharo (towu) a colegio cierical, auxiliary to the Morelia Seminarium. At Celaya (city) a Franciscan College. At Salamanca, an Augustine College. Besides which, there are "Colegios del Gobierño" in the States of Zacatecas, Agua Calientes, Durango, Oaxaca, and Yucatan, Queretaro.

Famous amongst the Mexican educationalists, were the former rector of the Morelia Seminary, Clement de Jesus Munguia, and also Pelagio A. Lavastida.

Señor Marcelino Martlnez, of Francisco street, in this city, filled, prior to the French intervention, the professorships of Logic and Metaphysics, iu the Colegio de San Nicholas de Hidalgo, at Morelia.

IN SOUTH AMERICA

There is a University at Lima, Peru, of which the Peruvians are very proud. An excellent Mining Academy also exists at Lima, in which the goverumeut specially interests itself, having recently deputized its ministers abroad to procure additional competent instructors.

In the other South American Pacific States, educational institutions do not appear to be in a flourishing condition. Many colleges formerly sustained by the Jesuits, were suppressed about 100 years ago, and frequent revolutions since then have operated disastrously upon them, so that the wealthier citizens have to send their sons abroad to be edncated,

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Contributions for our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

No. 310.—Galena, gold and copper, and iron pyrites, in quartz matrix, from the "Independent," a parallel vein, 300 feet east of the Sonlsby mine, Tuolumne Co., owned by Davidson, Bawden, Floyd and others.

No. 311.—Opals, with magnesian incrnstations, from Mokelumne Hill, Calaveras County.

No. 312.—Gold and crystallized iron pyrites, in coarse granular qnartz, from the Alexander mine, adjoiuing the Gwin, or Polomo, at Lower Rich Gulch, five miles below Mokelumne Hill; taken 135 feet from surface in a 7-foot vein. The same character of sulphurets are found in the Polomo, immediately adjoining.

No. 313.—Gold, with copper pyrites, spots of erebuseite, and galena, from Confidence, Sugar Pine District, Tuolumne County, S. Gilsou, Superintendent. Selected from a large vein of good-looking low-grade ore.

No. 314.—Auriferous iron pyrites, in large square crystalline masses, with parallellism of arrangement, iu quartz, from the Washington mine, owned by Woods & Bacon, five miles northeast from Mnrphy's.

No. 315.—Beautiful specimen, showing gold in quartz, and pyrites in chloritic slate, from Heslip's mine, Quartz Mountain, Tuolumne County; a peculiarity taken from the lower level.

No. 316.—Pyrites, variegated—a beautiful oddity, from Sonlsby mine, Tuolumne County,

No. 317.—Variety of Silver Fahlerz, or polytellite, from the Rawhide mine, Tuolumne County. This sample is a piece from which three ounces (avoirdupois) were assayed hy Dr. Snell, of Sonora, producing two pennyweights of silver, one and one-fourth grains of gold, one grain of tellurium, and one-half grain of copper.

No. 318.—Quartz vein, showing parallelism of formation, and containing free gold, from the Casco mine, owned by J. J. Haley, of San Francisco, and J. R. Hardingburgh, at the mine, Amador County.

No. 319.—Gold, pyrites and galena, in qnartz, from Washington District, five miles northeast from Mnrphy's, Calaveras Connty. These samples are not selected, hut really are average rock from an undeveloped thirty-inch vein. Rich in gold.

A NEW WATER WHEEL FOR GRAVEL MINING.—We take the liberty of copying the following remarks from a business letter from Edwin Adams, of Clipper Mills, Butte County, patentee of a new water wheel which we may illustrate in some future number of the PRESS:

"PORT WINE, Sierra County, Dec. 14th, 1868.—I have had a wheel built at Locher's fonudry at Oroville, for the purpose of hoisting the water and gravel out of a deep placer mine at this place.

I have 'set it up' and am now running it. It does its work easily and entirely satisfactorily.

The wheel is only twenty-two inches in diameter. The buckets or floats when out at their full lengths present a surface of two inches square; perpendicular hight of water 100 feet. The gearing is arranged or constructed as ten is to one, that is to say, the water in passing through the trough or concave of the wheel, run ten times as fast as the perimeter of the hoisting drum. It has to hoist a car and contents weighiug about 3,000 pounds each up an incline 116 feet long, and having a perpendicular rise of thirty-five feet.

HARNESS.—Oil your harness *first—then* wash it. Don't reverse the order of the two operations, as is generally done. So says, at some length, a correspondent of the *Scientific American*.

A MERRY CHRISTMAS AND HAPPY NEW YEAR to all subscribers, inveutors and readers of the PRESS—aud the rest of mankind.

If You Please!

We would remind those of our subscribers whose subscriptions have already expired, (or will expire on the 1st of January,) that we shall be happy to have them forward the amount of their annual subscription before our next issue. It will save us much time and expense to have patrons send in their subscriptions just before, or promptly at, the time of expiration. We have been unremitting in our efforts during the past volume, to render our paper valuable and acceptable to our readers, and we are sufficiently encouraged with the result to anticipate still greater enthusiasm in the future, in extending the value and usefulness of the PRESS. We hope to receive the subscriptions of many old and new patrons for 1869.

Dec. 24, 1868.

Three Calendars in One.

We have just issued an annual circular, of convenient size for the office and counting house use, containing large calendar for 1869 and small calendars for 1868 and 1870; also alphabetical table of distances from San Francisco, U. S. Revenue Stamp Tax, U. S. rates of postage, rates of foreign postage, relative value of currency, information about patents, etc. It is for general circulation, and free for all who may send for it.

We enclose copies in our local edition today, and would request such readers as do not care to preserve their copies, to give them to persons who will post them in prominent places, and thus oblige.

Our Office.

The office of the MINING AND SCIENTIFIC PRESS is located in the second story at No. 414 *Clay* street, north side, just below Sansome. Here we have spacious accommodations, with our patent rooms, editorial room, counting room, newspaper and job printing offices,—all conveniently arranged and connected, and our facilities for dispatching business correctly and economically, better than ever before. Don't forget the number —414 Clay street, below Sansome.

DEWEY & CO.

No Branch Office.

Our friends and patrons will bear in mind that we have no branch office in San Francisco, our U. S. and Foreign Patent Agency rooms being suitably arranged with our MINING AND SCIENTIFIC PRESS printing office, at No. 414 Clay street. We have no partners in business except the undersigned. DEWEY & CO.

A. T. DEWEY. W. B. EWER.

A CONTRAST.—During one of the rainy days of the past week, we took a Market street car for Woodward's Gardens. We found the walks around the grounds perfectly dry, contrasting very favorably with the muddy streets and pavements of the city. We found both amusement and instruction in the Library and Gallery and in the finely selected Cabinet of Natural Curiosities.

SULPHURETS and rich Rebellious Ores are wanted in this city, by ROBT. TAYLOR & CO. See advertisement in another column. 17v17tf

RETURNED.—Dr J. H. Paine, Dentist, Wadsworth House, No. 225 Bush street, between the Occidental and Cosmopolitan Hotels, San Francisco. 21v17-4m

Mr. Mowry, lately a clerk in a hotel at Colfax, is requested to call at the office of the MINING AND SCIENTIFIC PRESS, No. 414 Clay street, below Sansome, San Francisco.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 23v17-am

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's Jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with *pure gold*—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anæsthetic ever discovered In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16tf

PAIN KILLER.

No article ever attained to such unbounded popularity.—*Salem Observer.*

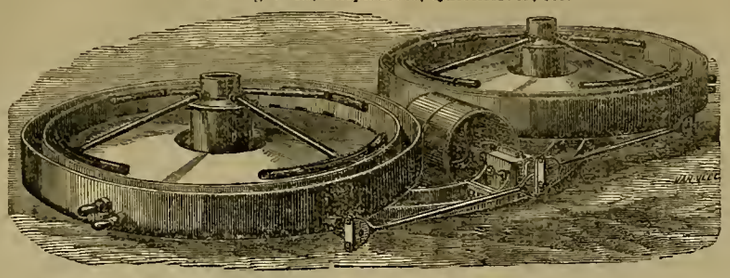
An article of great merit and virtue.—*Cinn. Nonpareil.*

We can bear testimony to the efficacy of the Pain Killer. We have seen its magic effects in soothing the severest pain, and know it to be a good article.—*Cincinnati Dispatch.*

A speedy cure for pain—no family should be without it.—*Montreal Transcript.*

Nothing has yet surpassed the Pain Killer, which is the most valuable family medicine now in use.—*Tenn. Organ.*

It has real merit; as a means of removing pain, no medicine has acquired a reputation equal to Perry Davis' Pain Killer.—*Newport (Ky.) Daily News.*



It is really a valuable medicine—it is used by many physicians.—*Boston Traveller.* 26v17-1m

Portable Engines.

The Swamscot Co's (warranted equal to any manufactured, may be seen in use in this city), PORTABLE and STATIONARY STEAM FIRE ENGINES, STEAM PUMPS and ROTARY PUMPS, and WOOD-WORKING MACHINERY of every description, at Eastern prices. Address W. O. M. BERRY & CO., 511 California street, San Francisco. 25v17-3m

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Many machines have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prator Concentrator, with which his name is already so familiar.

RECOMMENDATIONS:

SAN FRANCISCO, October 19th, 1868.

MR. M. HUNGERFORD—*Dear Sir:*—We have had twelve of your Concentrators at work at the Oneida Mine, Amador County, for about six months. They give entire satisfaction. They are strong and substantial, requiring, thus far, no repairs, and do their work thoroughly and effectively. At a recent clean-up of four of them, I found that in four weeks' time we saved about $500 in free gold, besides the sulphurets, or not far from one dollar per ton on the entire crushing of the ten stamps connected with them. In my opinion, it is for the interest of every quartz mill to have your machines. Yours, respectfully, GEORGE PRINGLE, Supt. Oneida Mine.

OFFICE OF THE ONEIDA MINING COMPANY, Jackson, May 13th 1868.

MR. MORGAN HUNGERFORD—*Dear Sir:*—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any others I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible. Very truly yours, JAMES MORGAN.

BIG OAK FLAT, May 25th, 1868.—*Mr. T. W. Mulford*—DearSir:—I have used two of M. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do. E. M. SMITH, Supt.

A full description of the principle and mode of action of this pan, is described in circulars, which will be forwarded to any party who may desire them.

The Hungerford Concentrator has only to be seen to be appreciated. No millman will use any other kind after he has tried that. They are in active operation in mills throughout the State, and give perfect satisfaction.

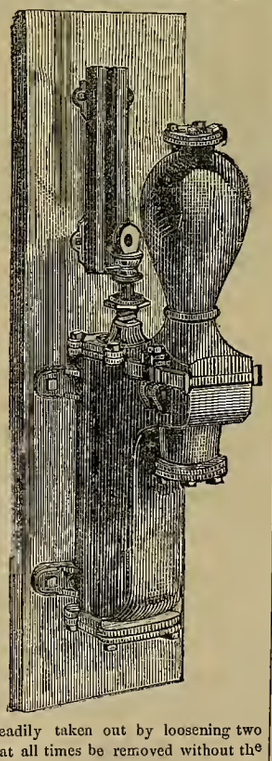
It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

In future these Pans will be manufactured by GODDARD & Co., at the Pacific Iron Works, San Francisco, which is a guarantee that they will be built in the most substantial manner.

These Pans may be seen at the Pacific Iron Works, First street, near Howard, San Francisco.

Address,

GODDARD & CO., San Francisco.



Or M. HUNGERFORD, at the Pacific Iron Works.

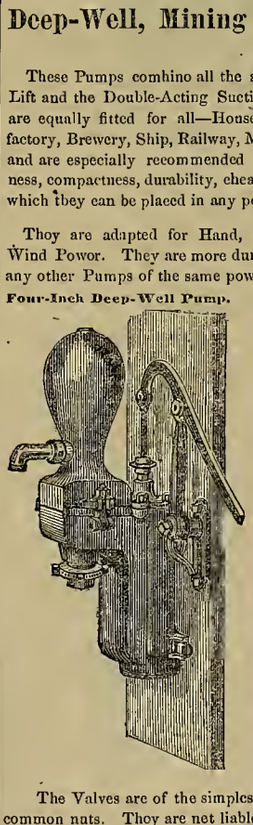
HANSBROW'S CHALLENGE

Deep-Well, Mining and Double-Cylinder Patent Pumps.



Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents, LOCKE & MONTAGUE,

☞Send for a descriptive Circular. 112 and 114 Battery Street, San Francisco.

Sheffield Scientific School

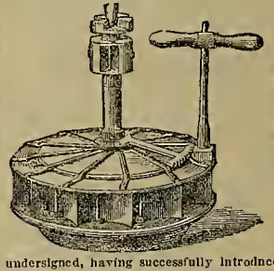
Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.



Tuition, $125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

Patent for Sale.

The Best Wheel in the World!

Triumphant in every Test with all other Wheels!!

The undersigned, having successfully introduced the
Leffel American Double Turbine Water Wheel
On this Coast, and owning the Patent for the whole Pacific Coast, viz: The States of California, Nevada and Oregon, and the Territories of Arizona, Washington, Idaho, and Western Montana, wishes now to dispose of the Patent, with stock of Wheels on hand, Patterns, etc., etc.

A Company organized and prepared properly for the construction of these Wheels, to supply this Coast and all tributary countries, could make the business immensely profitable.

My object in selling is to enable me to devote myself exclusively to my profession. A. MYERS.

P. S.—If not sold previous to February 15th, then I would enter into an arrangement to manufacture by paying royalty. Address Rev. A. MYERS, Portland Oregon. 26v17-1m

PATENT RIGHT
—FOR—
MANUFACTURING PROOF SPIRITS
FOR SALE.

Attention is called to MARTIN'S NEW PATENT for a process for Distilling Alcohol (85 per cent. or higher), without rectifying, which is offered for sale on favorable terms. Samples may be seen, and further information obtained, at No. 423 Washington street.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Knox's Amalgamators,

WITH PALMER'S PATENT STEAM CHEST.

Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

IRA P. RANKIN. A. P. BRAYTON. A. C. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Freiberg Barrels; Varney's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hausbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States.

Orders promptly attended to. Prices as low as possible for first class work, and we intend to do no other.

DR. NESTELL'S

LUNG INSTITUTE,

(Branch of the N. Y. Lung Institute)

No. 516 SUTTER STREET,

Between Mason and Powell Streets, San Francisco,

For the special Treatment of all Diseases of the HEAD, THROAT, LUNGS, AND CHEST, by the Inhalation of Medicated Vapors at the natural temperature of the air, etc.

Earnest attention is solicited to this Rational Method of Treatment, which transmits the remedies, in the form of vapor, directly to the seat of disease, instead of by the roundabout way—through the medium of the stomach—and which is conceded to be the only reliable means whereby an alleviation and cure may be expected. My system of Inhalation, now well known throughout the United States and Canadas, and much of Europe, where thousands—many of them far advanced—have recovered, claims the profoundest approval of the medical profession, and the timely and candid consideration of those afflicted with these the most devastating of all earthly maladies.

Patients attended at the Institute, daily, from 9 A. M. till 4 P. M.

Invalids at a distance, on writing their case, can receive the remedies by Express.

Special attendance out of the city will be charged commensurately with the time and distance occupied.

All communications must be addressed to

Price $1, complete; to be had, with full directions, at WM. ZELNER'S German Drug Store, 18 Geary street, 25v17-3m

COLORING EARTHS, ETC.—Terra de sienna, umber, red, yellow, and other oehcrous coloring earths, are found in ahundance and purity in many places in the Coast Raege and foot-hills of California. Several deposits have been opeued. The colors prepared from them are varied and excellent. The limited market for their sale, and the importations from the Atlantie States and Europe, render their mannfacture on a large scale unprofitable, though considerahle quantities are used hy the local painters and others.

The most noted of theso oeherous deposits was discovered in 1860, near the towe of Martinez, Contra Costa Couuty. Six well-defined heds of ochre have been found in this locality, whieh range from 10 to 20 feet thick, aed extend from El Humbre Creek to San Pablo Bay, a distance of six miles. In 1862 a 20-horse power steam eegine, for grinding the eolors, was erected, aud ahout 100 tons, of as many as 84 tints, from white to hlack, embraeieg a pale huff and bright vermillion, were prepared. But the causes ahove mentioned rendered the enterprise unprofitahlc, and it was ahandoned within a year of its commeneemeet. Some of the colors made are as bright to-day as when first prepared.

In 1866 a deposit of terra de sienna was found on Gold Gulch, ahout six miles from San Lorenzo, Santa Clara County. Yellow oehre is fouud in the same locality.

There are bodies of eoloring earth, red, purple and white, about five miles west of Ione City, Amador County, which form a portion of what is kuown as Pratt's Hill, a promontory extending some distanee into the Sacramento Valley from the foot-hills.

Beds of sienna aud umber exist in the mountains in the vicinity of San José, Santa Clara County. Fuller's earth is found in the same locality.

Red ochre is found on Red Rock, in the harbor of San Francisco, and at other places along the coast.

The above localities are named because the materials found in them have been used and aro known to be valuable. But there are many localities where eoloring earths, elays, etc., are known to exist, which are omitted hecauso they have not heen developed.—*Mineral Resources.*

HOW INDIVIDUALS ARE ENRICHED BY MINING.—The first effect of the production of the preeious metals in rich mines is that it enriches the individual engaged in mining, or at least gives him an opportunity to enrieh himself. A large proportion of mankind are so stupid, so imprudent, so wasteful, or so iedifferent to the valuo of money, that they eannot mako money whon they have the best of ehances, or keep it after they get it. The wages of miners are higher than those of other laborers, and when the mines are very rieh the proprietors heeome possessed of immense sums. In the minieg districts nearly every man when he goes out walking over the hills keeps a lookout for "indications," in hope of finding some vein that may make him a millionaire.

The poorest white laborer in California working by the month gets a dollar a day besides board, and as the French or German laborer ie Europe receive less than 50 eents a day, the Californian ean, with his earnings, hire two Europeans to work for him, or he ean purchase as mueh as two can produce, or he ean afford to consume as much as two European laborers do. He wants their merchandise and they want his gold; so he exehanges one of his days' work for two of theirs. In this way he may live rich, even if on aeeount of his extravagant habits he does not die rieh. But the disproportion between wages in California aud Europe is still greater in other oeeupations. The average pay of lahorers and the average profits of husiness men in California are from three to five as great as in eontinental Europe for labor or husiness of the same kind, and the differenee represents a ten-fold profit. If it eosts 75 eents per day to live, the man who gets $1 per day ean lay by capital twice as fast as the man who makes only 87½ eents. If the laborer of California had lived during the last 17 years with as little unneeessary expenditure as the lahorer of Germany, there would seareely be a man among the old residents without his thousands.—*Mineral Resources.*

FREEDMEN'S WAGES IN SOUTH CAROLINA. A eolored farm lahorer in South Carolina receives about $100 a year besides food, whieh eosts about $50, making his pay $150. Women and seeond-rate men hire for their food and from $5 to $7 a month in money.

PATENT OFFICE REPORTS, from 1843 to 1847, MECHANICAL are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

PACIFIC RAILROAD COALITIONS.—It is rumored in St. Louis that the Atlantic & Pacific and Union Pacific, Eastern Division, which opposed each other last winter in obtaining legislative indorsement for Congressional subsidies, each denying an exclusive franchise to the Pacific *via* Albuquerque, have united forces, and will attempt to engineer through Congress, after first receiving legislative indorsement of Missouri and Kansas, a mammoth subsidy. The coalition is upon a basis that the Union Pacific, Eastern Division, shall have a road to Denver, with branches to Albuquerque, and the Atlantic & Pacific from Fort Scott, Kansas, to the Pacific, *via* Albuquerque, the companies in effect to be consolidated, though worked under respective charters and nominally different boards. This combination will have great strength at the East, the Atlantic & Pacific being principally owned in Boston, and the Union Pacific, Eastern Division, in Philadelphia. *Western Railroad Gazette, (Chicago).*

PRESERVING SPECIMENS BY CARBOLIC ACID.—The use of this acid for the preservation of all kinds of organic matter, is as old as its discovery. A solution of the acid in ether may be conveniently used.

PATENT
Boiler Scraper and Tube-Cleaner.

IT IS THE CHEAPEST, MOST durable, easiest to adjust, and cleanest apparatus to use for the purpose designed, yet offered to the public. Being constructed on simple and mechanical principles, it is not liable to get out of order, and will continue to perform its office until the materials are worn out. It can readily be adjusted, even by any inexperienced person—will scrape off the scales and cleanse the tubes just as smooth and clean as they were when new, without in the least affecting their inner surface, as the Elliptic Spring Scraper has a smooth square edge, and springs in or out to fit the tubes. It is particularly applicable for steamboat boilers when muddy water is used.
A continuous iron rod runs through the center of the top and bottom hubs. The soft steel scrapers are fastened with screws to the hubs, under the caps, which cover and protect the screws that fasten the scrapers on the hub. The scrapers are expanded or contracted by screwing or unscrewing the lower hub,—first loosening the cap. There is a collar on the rod to prevent the scrapers being jammed. An elastic or flexible brush or scraper, made of leather, rubber, or some pliable material, is attached to the nut for the purpose of removing from the tube the scale and dust loosened by the action of the scrapers.
These scrapers are made from one to six inches in diameter—the prices of those from one to three inches ranging from $5 to $12. They are now extensively used in the Eastern States. Quite a number have already been sold in this State.
For sale by McAfee, Spiers & Co., boiler makers, Howard street, between Fremont and Beale, San Francisco, and at the Union Foundry, Sacramento. E. M. D., P. O. box 17, San Francisco, Manufacturers' Agents. 24v17tf

Different sizes of Redwood Balusters constantly on hand for sale. Also Spanish Cedar, Walnut and California Laurel.
13v17-3m N. P. LANGLAND.

To Inventors on the Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Steps Necessary to Procure a Patent.

The FIRST thing required is a model, if your invention can be represented by one. It is not only immediatcly necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelvo inches in any of its dimensions. A model of less size will answer when more convenient. It should he neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should he sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., *Mining and Scientific Press, San Francisco.* Prepay expenses and send express receipt to us by mail.

A full description must also be sent witb the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with tho model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On receipt of the model and Government first fee of $15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, witb a letter of instruction, etc. Our fee for preparing the case is then due and will he callcd for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of $20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or bis agent. And if the final fee for sucb patent be not paid within the said six months, the patent shall be withheld, and the invention thercin described sball become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is ten weeks. We frequently get them through in less time but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Advantages to Patrons of Our Agency.

Some of the advantages to he obtained by patronizing us may be enumerated as follows:

1. Inventors on this coast having their applications for patents made out through our agency, can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of tho MINING AND SCIENTIFIC PRESS, *free of charge;* the inventor paying simply for the engraving, which will he executed at a moderate charge. The same cuts can be subsequently used for books, letters or circulars. In a word, we are determined to make it of decided interest for every inventor on this coast to patronize home talent and enterprise.

3. Most inventions on this coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal verbal explanation is oftentimes of important service, and enables us to he more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We bold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, tbe purchaser should invariably demand a certificate of genuineness.

For sale hy all respectable dealers.

The Chili Exposition.

THE UNDERSIGNED WOULD CALL THE ATTENTION of the manufacturers of California to the National Exposition to be held during the coming spring in Valparaiso, Chili, next to California, is the most important country on the Western Coast of America. And this Exposition cannot fail to create a demand for our staple manufactures, if they are well represented. The writer has resided for some years in Chili, and is familiar with its people, business and language; is a practical mechanic, and proposing to visit the Exposition, offers to take charge of machinery or other material that parties may wish to send thither, and pledges himself faithfully to bring before the public of Chili their respective merits. He can be seen daily, at his office, No. 49 Montgomery Block. Prompt action is necessary.

DAVID R. SMITH,
Civil and Mechanical Engineer.

THE CELEBRATED

IMITATION GOLD

$15. Hunting Watches. $20

Special Notice.—Our superior Oroide Watches having recently been imitated, and worthless watches sold in New York, Boston, Chicago, and other cities, represented as our watches, we hereby caution the public against them, and give notice that we are in no way responsible for these bogus concerns, and only those purchasing directly from us can secure a genuine Watch of our manufacture. We have recently greatly improved our Oroide in appearance and durability, and, to protect the public from imposition hereafter, have named it the "COLLINS METAL," and we give notice that any one making use of this name will be prosecuted to the extent of the law.

This metal has all the brilliancy and durability of gold; cannot be distinguished from it by the best judges; retains its color till worn out, and is equal to gold excepting in intrinsic value. All our Gentlemen's Watches are *Full Jeweled Patent Levers;* those for Ladies an improved Escapement, better than a lever for a small Watch; all in Hunting Cases, and fully guaranteed by special certificate. The $15 Watches are equal in neatness, style of finish, general appearance, and for time, to a gold one costing $150. Those for $20 are of *extra* fine finish, and are fully equal to a Gold Watch costing $200. Chains of every style, from $2 to $6. Also, Jewelry of the Collins Metal in every style.

To Clubs, where six Watches are ordered at one time, we send ONE EXTRA free of charge. All our prices are in Currency.

Goods sent to any part of the United States by express, to be paid for on delivery. Money need not be sent with the order, as bills can be paid when goods are taken from the express office. Customers must pay all express charges. We employ no agents; orders must therefore be sent directly to us. Customers in the city will remember that our *only Office* is

Nos. 37 and 39 Nassau street, New York,

Opposite the Post Office, (up stairs.)

C. E. COLLINS & CO.

Citizens of Toronto and the Dominion generally, take notice. We have hundreds of testimonials. But you need no further evidence than the following from one who is well known among you. Here is his proof positive.

Harry Hazleton, the well known author, says:

"I have always looked upon cheap watches as humbugs, and dealers in them as little better than swindlers. At the request of a friend, I have worn for three months, the watch he purchased of C. E. Collins, and for which he paid $15. It accurate time, retains its perfect golden appearance, and I can really see no difference between it and my own, which cost five times the amount of the Collins Watch."

Mr. Hazelton adds:

"I have since purchased FIVE of these watches, at the request of friends, and those for whom they were intended are perfectly satisfied. Others are seeking for them, and I fancy that Mr. C. will find some difficulty in supplying the constantly increasing demand."

☞The regular price of the watch is $15, and others costing $20. These are superbly finished, and really superior to any article placed upon the market, costing five times that sum.

Office State Capital Reporter, 42 and 44 J street, Sacramento, Cal., July 15, 1868:

C. E. COLLINS & Co.—Gentlemen:—Wells, Fargo & Co. delivered Watch and Chain, as per order, paid bill on presentation. The Watch and Chain give entire satisfaction, and several of my friends wish the same quality of watch and chain. One is chief editor of this paper, and two others are the publishers of this paper, and the others are for friends of mine, and by wearing your goods will make you a large sale in this city. I therefore wish you to send me seven watches and seven chains, of same quality as those you sent me, price paid you $15 for watch, and $6 currency for chain. I return you the guarantee, it may assist you in ascertaining the exact kind of goods sent me, the number of the watch sent is 66,932. If this order sent turns out as satisfactory as the first, we will give you a good editorial notice, and help you along as far as practicable. I send this order not for my benefit, but for yours and to accommodate my friends. Send to E. K. Phipps, office of "State Capital Reporter, Sacramento, California."

Yours, respectfully,

E. K. PHIPPS.

Address,

C. E. COLLINS & CO.,
37 and 39 Nassau street, New York.

CONDITION OF THE MINING INTERESTS IN ARIZONA.—Gov. McCormick's message to the Legislature of Arizona, which recently convened, has the following pithy review of the condition of the mining interests in that Territory:

The Wickenburg gold mines are worked without interruption and steadily yield a large revenue. The Vulture lode, the Comstock of Arizona, now has a wide and merited fame. It is one of the richest, most extensive and remarkable deposits of gold quartz upon the continent, and its return to this time is believed to be but an earnest of what may be expected from it in the future. Unfortunately the mills erected in the vicinity of Prescott were put either upon worthless lodes or upon those in which ores predominate which cannot be made to pay by ordinary treatment. The chlorination process has lately been introduced there, and it is expected it will prove successful as in California and Colorado. If such is the case, the hopeful people who have clung to that part of the Territory, under most annoying delays and disappointments, will speedily reap the reward due to their patience and pertinacity.

Upon the Colorado River little is doing in mining; the low price of copper has not warranted the continuous working of the lodes at William's Fork and other points, although a renewal of operations at an early day is promised. From the Eureka District there is a steady and profitable shipment of lead ore to San Francisco, and work upon several silver lodes in that district is vigorously prosecuted, as it is on several gold lodes near La Paz and Hardyville.

Below the Gila, the Cababi mines continue to yield a good return of silver, and a fine mill is in process of erection at Apache Pass, where the gold lodes are attracting much attention and give excellent promise. Confidence in the mineral resources of the Territory is unshaken, and those most familiar with them believe that once secure from Indian depredations and made accessible by the iron rail, Arizona will take front rank among the gold and silver-producing districts of the world.

KILAUEA AGAIN ACTIVE.—EARTHQUAKES. The volcano of Kilauea is again active. Advices from Hawaii state that a severe shock of earthquake was felt on the 16th of November, and a letter just received, dated Nov. 27th, says: For "the last ten or twelve days earthquakes have been much more frequent than during three months preceding. The atmosphere has also much of the time been filled with smoke, which seems to come from Mauna Loa."

Machinery.

VARNEY'S PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has everre-quired repairs. The constant and increasiug demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantiy and perfectly in contact with quicksliver, that the particles are rapidly and completely absorbed.

All men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1vl . San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on applicatiou to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

21v17-qy **J. WEICHHART, Proprietor.**

IMPORTANT TO WOOD WORKERS.

GEAR'S COMBINATION

PATENT,

Variety Molding and Planing MACHINE.

THIS STANDARD MACHINE IS INDISPENSABLE IN any establishment working Wood by machinery. Recent great improvements render it complete for

All kinds of Irregular and Straight Work

in hard or soft wood, Straight, Waved, Circular and Elliptical Moldings, Spiral Work, and all Irregular Forms, thus saving to the mechanic the cost of several machines to effect the purposes accomplished by this alone. It does not stop at cutting the edges and sides of timber, but operates equally well upon the ends, cutting them into any required form with the same facility that it does the sides. Any shop without it lacks one of the most USEFUL AND PROFITABLE TOOLS now used. It is worthy of the attention of all HOUSE, CARRIAGE, SHIP, BOAT and CAR BUILDERS, FURNITURE and CABINET MAKERS, MILL PROPRIETORS, PATTERN MAKERS, etc., and of all others who desire to make a profitable business from a small investment. Every machine is thoroughly tested at the manufactory and warranted. Further information furnished on application. FULLER & CO.,

HYDROSTATIC WORKS.

SAN FRANCISCO

Pump Manufactory

And Patent Water Closets.

M. D. LASSWELL,

No. 747 Mission Street, bet. Third and Fourth.

House Plumbing and Gas Fitting in all of its modes. Lead, Iron and Copper Pipe fitted for water, steam and gas. Ship Plumbing, and Ship Pumps made and repaired Hose of all sizes, Couplings and Nozzles, Roses and Rose Stands, and all kinds of Brass Cocks. Force, Lift and Suction Pumps of all sizes made and set to order.

I am now prepared to make all kinds of Pumps for miners and for irrigating in a large way. I am making four sizes of single acting Brass Pumps, similar to the Haden & Sandeis Brass Pumps. I am also making a very superior Pump to any in this market for windmills, single-acting. I am making four different kinds of double acting Force Pumps, and different sizes of each kind. I am also making Artesian Well Pumps of a superior kind. This Pump may be lowered in any well to any depth desired. It is a force pump, or it is a suction pump, or it is a lift pump, and may be worked by hand or windmill, or any kind of power. Can be used for oil wells better than any other, and the Pump is the most durable and easiest repaired of any Pump in the country.

I have invented and am making a superior double-acting Force Pump, called the GOLDEN STATE, which has great advantages over any Pump in this State. It is the easiest Pump repaired, and is the most durable of any Pump in the pump kingdom.

☞ This Pump received the **Silver Medal** and highest premium at the Mechanics' Fair; also the highest premium at the late State Fair. At the San Jose Fair my Hydraulic Force Pump received the First Premium, and four other Pumps each a diploma.

Any one in want of a Pump or anything in my line, will do well by calling at my place before purchasing elsewhere. ☞ I also keep all kinds of DOUGLASS and other makers' Pumps on hand. 11v17-tf

Hose and Belting.

Fire, Hydraulic Hose and Leather Belting, made of the heaviest and best quality of Oak-tanned Slaughter Leather Also, Fire Buckets, Suction Hose, etc. Our Belting is well stretched, cemented and warranted to run true, and our Hose guaranteed to give satisfaction. A large assortment always on hand and orders promptly filled. No. 801 Battery street, San Francisco. 13v16 3meow

Novelty and Usefulness Combined.

Wilson's Prepared Solder

Dispenses with the Soldering Iron.

It will save you both time and labor. One bottle of this Solder will mend all the tins you have laid one side for months, and make them good as new. Get them out and mend them. It is cheap—only 50 cents a bottle; it is convenient and compact. Use any kind of lamp that has a blaze no larger than a single wick; a spirit lamp will make no smoke. You may mend a dish or can over the best table without fear of spoiling it. Try it, and you will never want a soldering iron in the house again. What a saving to farmers. No more stopping up of holes in milk pans with a rag. Milkmen can mend their own cans. It does the prettiest job on any article you have in the house, from a pint dish to a wash boiler. It is a sure thing to stick when resin and solder will not. It will stand heat as well as any solder ever used over fire.

Agency for the Pacific Coast, Room No. 10, No. 423 Washington street, San Francisco. AGENTS WANTED.

Address P. O. box 17. 23v17tf

Asphaltum.

This mineral is abundant in California, but has not been found in any of the other States or Territories on the Pacific coast. Though generally admitted to be of the same nature and of the same origin as petroleum, and usually found in combination with that substance, it is different in appearance, and is applied to different purposes. As one of the mineral products of the coast, it is classed under a separate heading.

The principal deposits of asphaltum are found in Santa Barbara County. It is seen along the coast from the Kayamos River, the line of San Luis Ohispo County, to the boundary line of Los Angeles. In this distance it assumes a variety of forms—hard as rock, soft as putty, oozing from the cliffs in lazy streams like molten pitch, or flowing clear and liquid like oil. There are reasons for believing that a deposit underlies the country embraced within bounds above given, and extending from Buena Vista lake to the sea. A spriug of it bubbles up in the ocean several miles from the shore, opposite the northern end of the island of Santa Cruz.

Near Carpentaria solid blocks of it lie piled np on the sea beach, while near the Dos Pueblos ranch it is found as glassy and brittle as rosin. Near the mission of San Buenaventura the earth for many acres is covered with it in various stages of hardness. Deposits of a similar character are seen in the vicinity of the Santa Inez River, and in the valley of the Kayamos, to the eastward, and near Buena Vista lake, to the south.

The most accessible deposit is on the Galeta ranch, about nine miles from Santa Barbara. The residents of this part of the coast have supplied themselves with materials for roofing their houses and paving their streets from this deposit for the past fifty years, and quantities are annually sent to San Francisco for the same and other purposes.

It is estimated that the asphaltum here covers 300 acres, and extends some distance under the sea. Masses of it are seen inclosed in the rocks which form the cliffs along that portion of the coast. In some places it is quarried and carried in boats to vessels anchored at a convenient distance. At others it is gathered up along the beach, when it is loaded, in the following manner: The vessel waiting for a cargo is anchored some 300 feet from the shore. A hawser is fastened to the land; on this a large block is riven, by means of which a flat-bottomed boat is hauled to within fifty feet of the shore, just far enough to keep it out of the surf which breaks continuously on the open coast. The party on shore, having collected two or three tons, pile it on a cart with a single pair of high wheels, when three or four yoke of oxen, trained for the purpose, haul it through the surf to the boat, into which it is shifted. It sometimes happeus that the cattle employed in this business are completely submerged by the rolling billows, but they appear used to it, and stand patiently up to their ears in salt water. The boat, when loaded, is drawn to the vessel by means of the block on the hawser. This is a crude way of performing such work, and will soon be abandoned, as increase of business has induced some parties to construct a wharf of sufficient length to enable vessels to come alongside to load.

There are deposits of hard asphaltum at points between the rivers Gaviota and Buenaventura, a mile or two from the sea beach; also on the ranches of Laguna, Todos Santos, Los Alamos, and others, ranging from thirty to fifty miles from the sea; but none of these are used as a source of supply at present.

The Pacific Asphaltum Company have a quarry of this mineral six miles from Los Angeles, from which shipments are made to San Francisco. The asphaltum is hard and black, requiring to be blasted with powder to break out sufficient to supply the demand. In July, 1867, it presented a face thirty feet in depth by seventy-five feet in length, very compact and of good quality.

Previous to 1867, most of the asphaltum used at San Francisco was brought from Santa Barbara County, the rest from Los Augeles. Recently considerable quantities have been received from San Buenaventura. The latter article sells at $17 per ton when that from other places is offering at $15 per ton.

About 2,000 tons are annually used in San Francisco for making sidewalks and roofs of buildings, purposes for which it is well adapted when properly prepared. There are a dozen firms in San Francisco engaged in this business. It affords employment to about 120 men. It was introduced as a material for pavement in San

Francisco in 1855. At the present time the principal thoroughfares have the sidewalks laid with it. Some of it, after a trial of ten years, exposed to a variable climate, is still hard and smooth. It is also used for other purposes, and its consumption is increasing. The Spring Valley Water Company nso it for coating their pipes, lining their reservoirs, etc., for which it is better adapted than cement or paint.

Many of the springs on this coast deposit asphaltum; others exude petroleum. None of the petrolem springs or lagoons north of Cape Mendocino produce asphaltum. Some of the springs in Santa Barbara and other southern counties do not deposit asphaltum, though in the midst of those that do. The petroleum spring on the Cañada Larga is an illustration of this latter class.

The deposits of asphaltum in California are sufficient to supply a very large demand. The present price (August, 1867) for asphaltum delivered at San Francisco, is from $15 to $20 per ton. At the quarries and along the coast it may be had from $3 to $5 per ton.

During the summer of 1867 quarries of asphaltum were opened near Alviso, ten miles north of San José, and three miles from Santa Clara, in Santa Clara County. Both of these points are convenient to the line of the San Francisco and San José Railroad.—*Mineral Resources.*

RESINOUS ROCK.—Five miles from Green River, on the line of the Union Pacific Railroad, a rock has been on fire in a large cut. When it became first ignited, the laborers endeavored to extinguish it by throwing water on it, but in vain. They then tried to smother it with earth and failed. It is thought to be sandstone saturated with petroleum.

SOIL, WATER AND TIMBER ON THE GREAT PLAINS.—An exchange gives the following very rosy view of the capabilities of the desert plains, east of the Rocky Mountains: All that appears necessary to secure a rapid growth of trees is to preserve the country from periodical conflagrations. In the neighborhood of Omaha, a farm of only a few years' standing, has oak, walnut, cotton wood, and other descriptions of timber, from a foot to eighteen inches in diameter, upon it in abundance, sufficient for the fuel and fencing demands of the place. With regard to water, it is evident from the wells along the route of the Pacific Railroad, that heavy streams permeate the land but a shallow depth below the surface. The finest vegetables are produced to the very top of the divide, and the most nutritious grasses are found in the same high altitude. Nature made ample provision in that region for the sustenance of innumerable wild herds, and tame cattle, doubtless, can live and fatten on the same provender. Leaving out of view the cultivation of corn, wheat and other grains, still as a pastoral country its resources are rich and desirable. Sheep prosper on the grand plains, and horses and black cattle can be reared there most successfully.

CALIFORNIA
BUSINESS UNIVERSITY
204 Montgomery Street.

Full particulars regarding our Practical Course of Studies may be had by calling at the University, or by addressing
17v17-qyt4p E. P. HEALD, San Francisco.

HENRY CAREY BAIRD,
Industrial Publisher,
No. 406 Walnut Street, Philadelphia.

HAS RECENTLY PUBLISHED

A Practical Guide for the Perfumer; Being a New Treatise on Perfumery the most favorable to the Health, and entirely without being injurious to the Health, comprising a description of the substances used in Perfumery, the Formulæ of more than one thousand Preparations, such as Cosmetics Perfumed Oils, Tooth Powders, Waters, Extracts, Tinctures, Infusions, Spirits, Vinaigres, Essential Oils, Pastels, Creams, Soaps, and many new Hygienic Products not hitherto described. Edited from Notes and Documents of Messrs. Debay, Lunel, etc., with additions by Professor H. Dussauce, Chemist. 12mo. $3 00

Cabinet Maker's Album of Furniture: Comprising a Collection of Designs for the Newest and Most Elegant Styles of Furniture. Illustrated by 48 large and beautifully engraved plates. In one volume, oblong. 5 00
The plates in this beautiful volume comprise designs for bedsteads in great variety; chests of drawers; wardrobes; dressing bureaus; tables for the chamber; work-tables; extension dining tables; card and chess tables; parlor tables, Louis XV. and other styles; office tables; chiffoniers; ladies' and other secretaries of different forms and styles; toilet tables and glasses; desks; book-cases; sideboards, etc., etc.

Gothic Album for Cabinet Makers: Comprising a Collection of Designs for Gothic Furniture. Illustrated by 23 large and beautifully engraved plates. Oblong. $3 00
The plates in this volume comprise designs for sofas, arm and other chairs, stools, taborets, prie-dieu, tables, chests of drawers, wardrobes, chimney-pieces, side-boards, pier tables, etageres, desks, book-cases, etc.

A Practical Guide for Puddling Iron and Steel.—By Ed. Urbin, Engr. of Arts and Manuf. A Prize Essay read before the Association of Engrs., Graduates of the School of Mines, of Liege, Belgium, 1865-6. To which is added a Comparison of the Resisting Properties of Iron and Steel, by A. Brull. From the French, by A. A. Fesquet, Chemist and Engineer. 8vo., cloth. $1 00

☞The above, or any of my publications, sent free of postage, at the publication prices. My new and enlarged CATALOGUE OF PRACTICAL AND SCIENTIFIC BOOKS, 56 pages, 8vo, is just ready, and will be sent free of postage to any one who will favor me with his address. 20v16 f

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

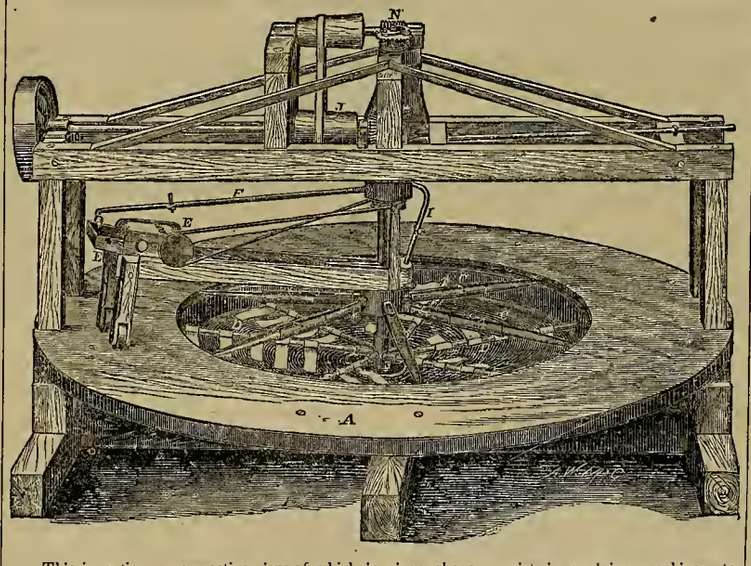
Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

...URES ...er Cent. ...ESS POWER Than any Blower Now in use.

☞ One of these Blowers may be seen on exhibition at T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ætna Iron Works, San Francisco, and many other places.



CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For circulars and further information, address

KEEP & BARGION,
4v16 3m Globe Iron Works, Stockton, Cal.

PAINE & STEPHENS'
IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action] It is calculated to do a large amount of work.

One Machine, costing about $1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps, Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE, STEPHENS & HARRY.

Metallurgy.

LEOPOLD KUH,
Assayer and Metallurgical Chemist,
(Formerly of the U. S. B. Mint, S. F.)
Office, No. 611 Commercial Street, opposite the Mint, San Francisco.

BULLION MELTED AND ASSAYED, THE CORRECTness of which is guaranteed in every respect. All kinds of Ore and Mineral tested, assayed and analyzed in the most satisfactory manner. Refers by permission to W. C. Ralston, Cashier Bank of California; Messrs. Pioche & Bayerque, Wm. M. Lent, John D. Fry, E. Cahill & Co., A. R. Grim, President Pacific Union Express Co.; John M. Eckfeldt, M and R. U. S. B. Mint; Hale & Norcross S. M. Co., and the principal mining companies on the Comstock Lode. 25v17-tf

JOHN TAYLOR & CO.
IMPORTERS,
AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior
ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.
A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865. 11v10-tf

PROF. HENRY WURTZ,
Formerly Chemical Examiner in the U. S. Patent Office, may be employed professionally as a SCIENTIFIC EXPERT. Geological Examinations and Reports, Analysis and Assays, etc., etc. Practical advice and investigations in the Chemical Arts and Manufactures. Invention and examination of new chemical methods and products. Address, 26 Pine street, Rooms 35 and 36, New York. Always in from 12 to 3.30. ☞Written communications preferred.

Important to Gold and Silver Miners and Companies.
PROFESSOR WURTZ,
Who is the Inventor and Patentee of the new and wonderful uses of SODIUM IN WORKING GOLD AND SILVER ORES AND JEWELERS' SWEEPINGS, will furnish at the above address sodium in relation thereto, together with experimental packages of
SODIUM AMALGAM.
All instructions and experiments elsewhere obtained are spurious and unreliable. WORKING EXPERIMENTS ON AMALGAMATION OF ORES, Etc. Prof. W. has in operation in New York a large and small Hepburn Pan, for working 1,000 or 20-lb. charges of material for experimental purposes. 3v17

G. W. STRONG,
ASSAYER AND WORKER OF ORES,
No. 10 Stevenson street, near First, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Ashes, Sweepings, etc., etc. Students instructed in all branches of Metallurgy, on liberal terms.
